Citizens turn out to vote not only because they have the resources to devote to politics and not only because they have the interests and beliefs to sense something to gain from politics. Citizens also turn out because somebody encourages them or pressures them to take part. The very nature of elections motivates political leaders to mobilize public involvement: the winner takes office and the loser goes home. Accordingly, in any election campaign, candidates, political parties, campaign organizations, interest groups, and other activists do their best to muster participants. Candidates appear at factories, offices, and service clubs; parties canvass and staff phone banks; campaigns proselytize, advertise, and troll for contributors; interest groups rally their troops. In any election campaign, moreover, the efforts of candidates, parties, campaigns, and interest groups are magnified by the subsequent social interactions of the people they reach. Families discuss campaigns, friends debate the options, and co-workers convey expectations. Electoral mobilization, in short, is an essential feature of electoral politics.

Over the years, the nature of electoral mobilization has changed in the United States. Party organizations powered by patronage have virtually disappeared. Television and direct mail have achieved new efficiencies in reaching an increasingly mobile, disconnected electorate. Face-to-face canvassing in neighborhoods has given way to polls and focus groups as means of assessing the public's opinions and reactions to issues. Door-to-door electioneering in precincts, on Main Street, and at factory gates has yielded to direct mail, TV ads, and infomercials. Grass-roots organization has succumbed to professional staff.

As political parties abandoned the labor-intensive canvassing methods of the 1960s for the capital-intensive media strategies of the 1980s, they contacted fewer and fewer Americans. Between 1972 and 1988, the proportion of the electorate reached by the Republicans or the Democrats fell 5 percentage points. It dropped again in 1992, by 3.5 percentage points; only one in five Americans was contacted by either of the major parties during the Clinton and Bush campaigns. This latest decline in party mobilization, our estimates indicate, pushed 1992 voter turnout .4 percentage points below and 1992 voter persuasion 1.8 percentage points below what it might have been had party mobilization been what it was in 1988.

In any electoral campaign, however, the political parties are not the only factions in the field. Candidates build independent campaign organizations. Interest groups, activists, and people with axes to grind pursue their own agendas. The print and broadcast media both cover and configure the election campaign. The activities of campaigns, interest groups, and the media, like the activities of political parties, promote electoral involvement. They underwrite the costs of political participation, especially the costs of information. They set in motion the social processes of expectation, obligation, and reward.

The activities of candidate organizations, interest groups, and other mobilizers are always proportional to electoral need. When elections are closely fought, they labor as if there is no tomorrow; when elections are runaways, they live to fight another day. The media, too,

respond to competition. They stay focused on the hot races; they grow bored with the blowouts.

The 1992 campaign between George Bush and Bill Clinton was the most competitive election contest in a decade. The election-eve Gallup Poll showed only 7 points separating Bush and Clinton, and some polls conducted in the final weeks of the campaign showed the race even tighter, with Clinton ahead by only 2 to 5 percentage points.[25] In contrast, the outcome of the 1988 campaign was never much in doubt; George Bush led Michael Dukakis by 12 percentage points on the eve of the balloting.

The American public's sense of the closeness of the election was likewise greater in 1992 than it was in 1988. In 1992, 79 percent of the electorate thought that the race was tight; in 1988, only 70 percent did.

The greater competitiveness of the presidential election contributed 1.0 percentage point to the rise in voter turnout and 3.1 percentage points to the rise in voter persuasion in 1992. The narrowness of the margin right up until the final days of the campaign increased the seriousness of the efforts by candidate organizations, interest groups, and activists to get people to the polls. The uncertainty of the outcome heightened the urgency of efforts by ordinary people to coax, cajole, and coerce their families, friends, neighbors, and co-workers to turn out on Election Day.

4. Lower Barriers

Finally, the barriers posed by registration and election laws came down, if only a little, between 1988 and 1992. Although still only 4 states permitted citizens to register to vote on election day and although only 6 other states allowed registration within 10 days of the election, the average 1992 voter faced a registration closing date that was about a day nearer the election than the closing date the average 1988 voter confronted.

---

[25]*The Gallup Poll Monthly*, November 1992, p. 9; and the CBS News/*New York Times* poll of 24 October 1992, the CNN poll of 27 October 1992, and the *Time*/CNN poll of 20-22 October 1992.

Easing the burdens the law placed upon the exercise of the franchise, by moving the registration closing date nearer the election, when awareness is greater and when the intensity of the campaign is closer to its peak, increased voter turnout in 1992, by a slight .1 of a percentage point.

5. The Residual

Greater resources, better choices, more extensive mobilization, and lower barriers together account for 4.1 of the 5.1 percentage point increase in voter participation between 1988 and 1992. They account for 8.6 of the 8.7 percentage point increase in attempts to persuade. That is not perfect, but it is a whole lot better than the combined contributions of the economy, the alienated, and the data processing mogul from the Lone Star State, which explained roughly zero.[26]

Still, 1 percentage point of the rise in turnout is as yet unresolved. What explains it?

It may, of course, simply be random error. Every social process has both stochastic and determined elements, and this remainder represents as much the idiosyncrasies of traffic, the weather, and local races as the peculiarities of the economy and Ross Perot. For another,

---

[26]We also considered the possibility that Perot and the economy might have had indirect effects on voter turnout. Perot's followers, we found, were no more likely than other citizens to be contacted by a political party or by someone else other than a representative from the two major parties. Perot's followers were not more likely than other citizens to be mobilized to take part in a political meeting or rally, to work for a candidate, or to contribute money to a party or candidate. Perot's supporters did not care any more than other citizens about who won the presidential election or about which way the election to the U.S. House of Representatives came out. The indirect effects of the economy were no more apparent. People who were unemployed or who were worse off financially were no more likely than other citizens to express concern over the election outcome. Respondents who believed that the government's economic policies had made them worse off were a few points more likely to express interest in the outcome of the House elections but no more likely to express interest in the outcome of the presidential contest. Citizens who judged the national economy worse off than the year before were about a bit more likely to care about which party won the presidential election, but they expressed no greater concern over the outcome in the House than did other respondents. People who regarded the economy as the most important problem facing the country were about 2 percent more likely to express concern over the outcome of the House contest, but were not more concerned than other citizens over the outcome of the presidential contest. None of these indirect effects contributes even a few tenths of a percentage point to turnout. Finally, none of the five economic variables had any significant effect on the likelihood of being mobilized by a political party or by someone other than a political party. People who were unemployed and people who were worse off financially were slightly more likely than other citizens to be mobilized to work for a party or candidate, but the effects are very small.

every social process is imperfectly measured, and these estimates of voter turnout depend as much as any other upon the vagaries of statistical accounting--estimates of the voting-age population, an accurate counting of the ballots, and survey estimates of population characteristics. It is not entirely clear that there is anything left to explain.

But supposing there is, just for the sake of argument, it might be the effect of processes we have been unable to represent in the statistical model upon which we base our simulations. The National Election Studies, like any data collection, imposed their own limitations on our model, and it falls short of a complete representation of the theory. In particular, we are still a considerable distance from a full accounting of the social context of individual voters and the efforts made by actors other than parties and candidates to reach them. Given the closeness of the 1992 election, extra-partisan mobilization efforts were surely more intense, but we had no direct way to assess their extent or their effect.[27]

Or, supposing there is a percentage point yet to explain, and supposing that we just cannot get the idea out of our heads, it might be the economy, the alienated, and the data processing mogul from the Lone Star State. As we have already argued, the most reasonable interpretation of our findings indicates that collectively they had but a tiny effect. The Perot mobilization of voters, by our best estimate, increased voter turnout .15 of a percentage point. But if we set aside our scruples and accept the validity a single coefficient, even though it has no analysis, no historical experience, and no side evidence to vouch for it, we can in fact locate the missing remainder. Under the most forgiving scenario, voters' concern over the economy lifted voter turnout .79 of a percentage point. That is only about one-sixth of the total increase, and it requires assumptions we consider heroic to reach it.

---

[27]New instrumentation on the 1992 National Election Study, as shown in the Appendix, has improved the situation.

Conclusion

And so we come to a close. The processes that brought voter turnout to an increase in 1992, we have shown, are the same processes that have affected voter turnout, primarily for the worse, over the previous three decades. Turnout rose in 1992 because the electorate's resources were augmented by additional education, additional efficacy, and additional maturity and experience. Turnout rose in 1992 because the electorate's interests were engaged by more attractive choices and more momentous stakes. Turnout rose in 1992 because the electorate was more extensively mobilized by campaigns, interest groups, and activists motivated by the closest presidential election in a decade. And turnout rose in 1992 because the electorate was impeded by fewer requirements of registration laws.

Many of these conditions, of course, have been improving for years, in some cases for decades. The educational attainment of the American electorate has increased steadily since the Second World War, and the most oppressive legal restrictions on the exercise of the franchise--poll taxes and literacy tests--fell before the advance of the civil rights movement in the 1960s. Why, then, did we watch voter turnout fall for three decades? Why did we wait until 1992 for voter turnout to improve?

The simple answer is that other conditions, conditions that diminished voter involvement, prevailed. Partisan allegiances weakened, eroding the electorate's appreciation of the benefits of involvement. Social attachments loosened, isolating the electorate from the social expectations, obligations, and rewards that promote political activism. Finally, and according to our estimates most importantly, elite mobilization of citizen participation waned. Campaigns abandoned labor-intensive canvassing strategies for capital-intensive media strategies, relinquished mobilization for persuasion. Civil rights protests, marches, boycotts, and voter registration drives subsided. These conditions continue to this day to depress voter turnout. They show little sign of abating.

Other conditions, however, have recently improved and provide some measure of hope, if not optimism, that the gains in voter involvement in 1992 might not, as in 1984, prove fleeting. By fits and starts, the electorate's belief in the efficacy of its actions has lately increased, bolstering the confidence it needs to take part. The enormous postwar "baby boom" generation is finally entering middle age, leaving behind the stage of life during which participation in politics is least and entering the phase during which involvement rises. The legal impediments to political activism, most particularly voter registration laws, continue to shrink.

The imponderables are the conditions of the electoral system. The 1992 election had an intensity that has been more the exception than the rule in the last couple decades. Whatever the pundits said, the public found the choice among George Bush, Bill Clinton, and Ross Perot consequential: It was motivated to turn out because it related to the candidates and it cared about the outcome. Whatever the oddsmakers expected, the contest was the most competitive in a decade: The campaigns, interest groups and activists were motivated to mobilize citizen participation because the additional increments mattered.

The future of voter turnout depends upon the confluence of this variety of conditions, and whether some things get better faster than others get worse. But unless the political system assists by generating attractive choices and fostering genuine competition, the revival of voter turnout in 1992 can only prove to be an engaging anomaly.

Appendix

Causes of Electoral Participation in 1992
(Probit Estimates)

	Voted	Tried to Persuade Others	Worked for Party or Candidate	Attended Meeting or Rally	Contributed Money to Party or Candidate
Resources					
Income	.404 (.172)			.234 (.211)	.492 (.266)
Education	1.251 (.177)				.309 (.241)
Age	.013 (.003)	-.015 (.002)		-.004 (.003)	.013 (.004)

WHO 'OWNS' AIDS SERVICE ORGANIZATIONS?: ISSUES IN THE POLITICAL ACCOUNTABILITY OF FOUR UPSTATE NEW YORK AIDS ORGANIZATIONS

Donald B. Rosenthal

WHO 'OWNS' AIDS SERVICE ORGANIZATIONS?: ISSUES IN THE GOVERNANCE OF FOUR UPSTATE NEW YORK REGIONAL AIDS ORGANIZATIONS

Donald B. Rosenthal
State University of New York at Buffalo

The use of public monies to support non-governmental organizations in delivering government programs has a long history in American government.[1] Sometimes those funds have added to the resources available to existing organizations -- both not- for-profit and profit-making -- to expand the delivery of existing services; sometimes they have been designed to stimulate organizations to undertake new program activities. At times, the availability of government resources also has served as an incentive for the creation of the non-governmental organizations in the first place.

While this relationship between governments (national; state; local) and non-governmental organizations in responding to what are perceived to be societal needs remains an important and interesting aspect of American public life, issues continue to beset society over where properly to draw the line between the reach of government and the independence of "third sector" organizations. That problem is well illustrated by the multi- dimensional debate over the use of public resources to support the provision of services by religiously-affiliated organizations whether those services are in education, health or foster care. Even where the public resources committed to private organizations are not substantial, the boundaries of the oversight responsibilities of government in influencing the operation of non-governmental organizations are by no means clear, as recent controversies over the access of gays and lesbians to the St. Patrick's Day Parade in New York City or governmental actions in the San Francisco Bay area to halt the discriminatory policies of the Boy Scouts of America illustrate.[2]

For political scientists, a fundamental problem in the maintenance of the relationship between government and private sector organizations is how to define and implement standards of accountability. Accountability, of course, has a long history as a normative issue in political science, both in the realm of democratic political theory and in debates over the application of performance standards in public administration. Even with respect to the operations of the public sector alone, that debate is as old as Plato's Republic or as recent as continuing controversies over Robert Moses' operations in New York or J. Edgar Hoover's in Washington, DC. If the establishment and maintenance of standards of accountability are difficult to achieve in purely governmental situations, such standards are probably more difficult to establish and put into operation when a non-governmental receives a share of its funding from government in order to carry out programs that are supposed to serve the public interest.

What standards of accountability are at issue? At a minimum, strict standards of fiscal accountability should be as readily applicable to private entities as to public agencies, though this is easier said than done. Much evidence from the performance of the public sector suggests that

even within its own house, government is not always capable of staying on top of individual agency fiscal performance, whether it be the performance of the Defense Department's procurement officers or overruns on major projects like the space station or supercollider. This type of scutiny is even more difficult where intergovernmental funding is involved; a literature on the fungibility of intergovernmental grants is now a part of the lore of the study of fiscal federalism.[3] In relation to non-governmental organizations, the history of malfeasance and misfeasance in the savings and loan industry and in the abuse of overhead from research grants by universities illustrates how difficult it is for adequate standards of fiscal accountability to be established and maintained.

What also can go wrong is suggested by recent events in San Francisco, where the Shanti organization has undergone a major upheaval apparently as the result of a poor performance on a housing contract with the city intended to provide housing to people with AIDS (PWAs). It is not clear to me from the one story I have read on the case whether the organization's lapses are the result of misfeasance or nonfeasance. What is more to the immediate point is that AIDS Service Organizations (ASOs) like Shanti -- dependent as they are on government money to support a major portion of their program activities -- must be held to a certain standard of fiscal responsibility by the governments that fund them.[4]

As troublesome as fiscal accountability issues may be, equally problematic are two other types of issues involving what might be characterized as program accountability and governance accountability. Program accountability is closely connected to fiscal accountability but focuses on performance and evaluation issues such as: how well did the recipient of the the funds carry out the program activities for which it was given government responsibility (and funding)?

In this paper, however, I will address aspects of the third form of accountability -- governance accountability. What is at issue here is how far governmental agencies do play a part in conditioning the internal operations of organizations which may be technically private but, in fact, depend largely upon those governments for their funding.[5] Equally important, I am concerned with how far they should bear responsibility for promoting democratic accountability in the operation of those organizations. From a somewhat different perspective, the principal question being asked here is, "To whom should governmentally-funded ASOs be responsible and how -- short of revolution, death or scandal -- can the leadership of those organizations be made democratically responsible to those who make up the relevant portions of their publics?"

There are many sides to the issues raised here, but I shall limit my focus to consideration of problems I have identified in the course of studying four multi-county ASOs over the past five years in the upstate New York regions centered on the cities of Albany, Buffalo, Rochester and Syracuse. These organizations have received the greater share of their operating funds from New York State's AIDS Institute since their designation as Community Service Programs (CSPs) in 1984.[6]

Creation of the Government Connection

In each of the four regions, the origins of the CSPs were in informal groups of friends and acquaintances (primarily from the gay and lesbian community) who saw a need late in 1982 or early in 1983 to "do something" about the spread of what only later came to be called Acquired Immunodeficiency Syndrome (AIDS). Instances of the infection were rare or slow to be recognized in these localities, so that the "grassroots" networks that developed were essentially volunteer-organized efforts to circulate warnings about the prospective emergence of the disease and to inform local people about possible precautions to be taken to minimize risk rather than involving the delivery of services to the infected.

In emulation of New York City's Gay Mens Health Crisis (GMHC), money might be raised locally through fund-raising events (including "bar nights" at local gay and lesbian bars) in order to establish an informational "hotline" to share whatever limited information was available about the disease or the proceeds were used to prepare pamphlets on AIDS or to give presentations to gay and lesbian groups. It is important to note that both in this early period and for many years thereafter, municipal and county governments (and many other "established" organizations) in the four regions were silent about the disease, which left much of the responsibility for responding to the crisis to the volunteer- run ASOs initiated during this period.[7]

Elsewhere, I have tracked in some detail the evolution of the four CSPs as they began to receive state funding in 1984.[8] State government involvement began with a small appropriation of $5 million in late 1983 by the New York state legislature (over the initial opposition of Governor Mario Cuomo) to create an AIDS unit within the state's Department of Health that would assist community-based organizations in providing information and support services. This first step also gave rise to the AIDS Institute, which began as a temporary unit within the Department of Health and has since become an increasingly large and relatively autonomous bureaucratic unit within the Department.[9]

Among the early responsibilities of the Institute were to work with existing ASOs or to assist in the creation of ASOs which could apply for designation as CSPs and then for program funding from the state government. In each of the four regions studied, groups were already in existence (though sometimes in a fairly rudimentary condition) in the central cities of the region -- Albany, Buffalo, Rochester and Syracuse -- which would fulfill the role of counterpart non-profit grant recipients. For the most part, these ASOs were based within the local gay and lesbian communities, but some of them also drew upon connections into local hospitals and into other health care and social service organizations. With the encouragement of the Institute and the promise of state funding, efforts were made by the nascent organizations to gain incorporation as not-for-profit organizations and to prepare by-laws for internal governance.[10]

The Growth of the CSPs

As state funding for each of the CSPs increased over the next nine years, they grew: 1) larger in the number of staff members employed; 2) increasingly bureaucratic in the way those

staffs were structured; and 3) more professionalized in the way services were delivered. Thus, by the 1990s, the four CSPs had full-time staffs ranging from 23 to 32 persons. In addition to building in a number of purely administrative positions (executive director; associate or assistant executive director; directors of operations; secretaries, receptionists and clerks; fund raisers and grant writers), typically the organizations came to contain two major service departments: one which provides client support services; the other whose principal function is preventative education. Typically, one staff member is also responsible for coordinating the recruitment, in-take, training and supervision of volunteers.

As any student of organization theory might predict, growth in the number of staff members and specialization within the staff has been associated with professional credentialing. This is particularly the case in client support services where staff are expected to counsel individuals and run support groups for clients (including collaterals) and provide case management services. The latter normally means identifying, gaining access and coordinating the provision of a wide range of services for which individual clients or their families may qualify.[11] Client support staffs are also responsible for overseeing the operation of "buddy" programs which link volunteers to clients so that they may provide appropriate support to those clients, including performing relatively simple household tasks and providing transportation services; buddy services are supposed to exclude more demanding psychological or personal services.

Education department staffs are normally engaged in dispensing information about the disease and recommended procedures for reducing or eliminating risk of exposure. This is done through a great variety of educational presentations as well as through the preparation and circulation of appropriate publications. While appropriate educational backgrounds as health educators and trainers are desirable, the professionalization of service positions in this area has proceeded more slowly than credentialing in client services.[12]

The Governance Problem

Mechanisms for internal governance of the CSPs were fairly primitive in their initial stages. Essentially, anyone interested enough to attend organization meetings was qualified to participate in decision-making. In each of the four organizations, as in any set of informal organizations that last for more than a few months, leadership began to emerge fairly early, though the Syracuse situation was more complicated in this regard than the others.

Early ASO leadership took different forms: in Buffalo, the creation of the local AIDS Task Force was largely the result of the efforts of a gay activist physician; in Albany, it was provided by several gay men who were well placed professionals within the state government or in academia; in Rochester, there was an especially close connection between AIDS activism and the extension of its influence by the leading gay and lesbian organization in the area. The Central New York CSP (centered in Syracuse) found itself in the most difficult situation of the four as conflicts between closeted gays and gay and lesbian activists made it more difficult to create an effective governance structure and also contributed to major problems in organizational management.

Selecting a Board of Directors

One aspect of early organizational development was the establishment of CSP boards of directors. Initially, the selection of a board was an informal process, often dependent on who showed up at meetings or who could be coerced into taking the positions. As noted earlier, most early board members were volunteers from the gay and lesbian community, though efforts were made in some places to bring in gays and lesbians and others who were health care or social service professionals.

As organizational resources grew, efforts were sometimes made by members of the boards or sometimes at the instigation of the administrative heads of the CSPs -- their executive directors -- to expand the representational "reach" of the boards. Some of these CSPs took initiatives on their own to build more diverse boards, but the AIDS Institute also came to play an increasingly stimulative role in pressing CSPs, in turn, to add: 1) people with AIDS; 2) minority representatives; and 3) representatives from outside the metropolitan core areas to the boards. Each of these additions reflected a distinct set of issues for the organizations.

One of the more contentious issues with which CSPs have had to contend is the role that people infected with the Human Immunodeficiency Virus (HIV) should play in their operations. Because testing for HIV infection was not available until 1985, there may have been some members of CSP boards who knew themselves to be infected before that date, but very few disclosed that fact. Indeed, the CSPs founders in the four communities initially discouraged the participation of persons with AIDS on their boards and most (at least for a time) limited the kinds of volunteer services that persons infected with the virus could provide.[13]

Local complaints and the political clout of downstate AIDS activists including persons with AIDS (PWAs) ultimately contributed to AIDS Institute pressures on the upstate CSPs for explicit of representation of persons infected. Nonetheless, even in 1993, the number of PWAs on any board is usually limited to only one or two. The picture is somewhat clouded by the fact that some board members have never indicated their HIV status, although these "closeted" PWAs are usually not very visible in challenging the policies of their CSPs.[14]

The "representativeness" of the PWAs formally selected as such also has varied with the particular persons. In Rochester, one of the PWAs currently serving on the board is the very visible head of an independent fund-raising organization for AIDS causes who is well-connected into the local PWA population. In contrast, those PWAs who have served on other boards have tended to be unaffiliated with any local PWA organization. Indeed, in one instance a PWA remained on a CSP board for several years after he had been ousted from leadership in a bitter dispute within the major PWA organization in the city. (The continued service of the PWA in question on the CSP board may have reflected the personal preferences of the executive director of the CSP who used it as an emblem of his continuing warfare with the local PWA organization.)

Secondly, the representation of African-Americans and Latinos/as on CSP boards has been a mixed experience. On the whole, minority populations in the four regions are small, and those minorities have been only weakly mobilized on the AIDS issue until quite recently. Indeed, until perhaps as recently as 1990 (except for Rochester), minority populations and the organizations that claimed to represent them in the four central cities tended to avoid any serious involvement in the AIDS issue. As a result, there was very little insistence by local minority organizations upon representation on the board or recruitment of minority staff, although an increasing proportion of agency clients were drawn from those populations.

Again, the AIDS Institute seemed to be responding more to the concerns of minorities in the New York City metropolitan area (and to the minority caucus in the state legislature[15]) than to upstate New York's minority communities when they encouraged CSPs throughout the state to add minorities to their boards. In most instances, this membership tended to be more symbolic than substantive, since the persons selected have been more concerned with representing particular minority-serving organizations than because they have any great interest in influencing the policies or operations of the CSP.[16]

The result, as in the case of PWAs, has been a kind of minority tokenism, though there are some notable exceptions to this characterization. Thus, the person who has served as president of the AIDS Rochester board for the last five years is a staff member of a neighborhood health center which serves primarily the African-American community. From her position on the board, she has played an active role in overseeing the operations of the CSP, including participating in the firing of the executive director who dominated the organization until 1989.

A third kind of representation has involved the recent inclusion of persons either living or working in outlying counties in order to build the involvement of professionals in those areas for the work of the agency. For the most part, the CSPs have sought to fill these positions with health care or social service professionals, rather than PWAs or AIDS activists of any stripe.

Finally, it should be noted that the selection of persons to serve on CSP boards has sometimes involved efforts at outreach to other service organizations. The options of the four CSPs have been rather limited beyond that. Perhaps it has been the relatively conservative environments in which they operate (though that argument would not apply as readily to the Rochester CSP), but the CSPs have recruited to their boards neither the usual social nor economic elites often associated with service on the boards of more "mainstream" diseases. Nor have they succeeded in gaining the organizational representation of major religious groups, although some religious groups have been supportive of CSP activities and some well-connected laypersons have been board members.[17]

Typical of the wariness with which board membership is approached by some people, a member of the AIDS Rochester Inc. (ARI) board who was executive director of the large and well- funded local Jewish Community Center (and also served as vice- chair of the CSP board for a time) made it very clear that he was serving as an individual and not as a representative of the Jewish community. Indeed, some of his own board members had apparently looked askance at his involvement in the CSP initially, though their concerns had abated as his service

continued and the CSP became accepted as more of a mainstream organization in the community.

Whatever their by-laws permit, the electoral procedures that have been put in place in each of the four CSPs has involved the effective creation of self-perpetuating boards whose nomination committees propose uncontested slates of candidates to fill board positions that open up because of resignation, death or term expiration. No class of organizational membership exists beyond members of the board, though in some instances, the electorate may include not only board members but persons who have been selected to serve on various standing committees but are not themselves on the board. For all practical purposes, then, the electorates are narrow ones and reflective principally of the preferences of the incumbent board and/or the incumbent executive director.

The practical effect of adding nominal representatives of population segments or organizational interests (rather than persons committed to AIDS policy issues) has been to weaken the influence on these boards of AIDS activists, or, at least, of dissident voices. For the most part, the minority board members and representatives of ancillary health care and social service organizations --including organizations serving intravenous drug users (IVDUs) --are more likely to be concerned with protecting their own organizational turfs than in building the influence and effectiveness of the CSPs. Along with representatives from the outlying counties, they have constituted a conservatizing force on the boards, supporting or encouraging the agencies' executive directors to go slow in promoting innovations in outreach or greater organizational visibility where leadership on controversial policy issues might be called for. This may account, in part, for the fact that the CSPs have not generally been "out front" on matters of preventative education through the schools or efforts to promote needle exchanges.[18]

What is at stake in the struggles for control over board membership can be illustrated by drawing upon the history of the Syracuse CSP. The original organization design for the AIDS Task Force of Central New York (as it came to be known) grew out of discussions with representatives of the AIDS Institute in late 1983. The organization was intended to draw together individuals recently mobilized on the AIDS issue with existing organizations that might have a concern with the issue, like hospitals and the Red Cross. However, there were conflicts between two sets of gays and lesbians represented at the initial meetings: an activist group which was already "out" to the larger world; and a group of closeted professionals who walked a fine line between committing their professional skills to responding to the AIDS crisis but were unwilling to become identified as gay and lesbian AIDS activists. While this conflict within the lesbian and gay community existed in some measure in the other communities, it seemed to be most pronounced in Syracuse.

What emerged organizationally was an unusually complex design for a Task Force. The Task Force itself would be constituted as an advisory committee made up of the various interests, while there would be a separate entity that would be incorporated to raise funds and to provide whatever education and support services were found to be appropriate. Before these

activities could be undertaken, however, it would be necessary to write a grant proposal to the AIDS Institute.

While the grant-writing effort was going forward under the aegis of the Task Force's Finance Committee, another committee was formed to deal with questions of organization. The activities of this committee provided a particularly contentious forum to the gay and lesbian members of the Task Force. Much discussion went on, for example, about whether even to include an allusion to "gays" or to "AIDS" in the name of the new organization with the closeted gays preferring to call the new organization the "Central New York Health Crisis."

The AIDS Task Force of Central New York, as it eventually emerged, continued to operate throughout the 1980s as a large body -- upwards of forty members. From one perspective, that arrangement allowed for a much more participatory organization than was the case in the other three cities. Instead of creating a small board of directors as the other organizations did -- with all the potential for elitism that that implied -- the Task Force remained a membership organization open to the vagaries of volunteer participation and to the interplay of particular personalities.

Unfortunately, that form of organization occasioned the creation and re-creation of numerous committees whose membership shifted with the ups and downs of volunteer interest. Committee chairs did eventually come to make up an Executive Committee of the CSP, but persons filling the chair positions shifted with some frequency, with the result that the continuity of operations of the Executive Committee was affected. Thus, while this open procedure in principle encouraged democratic participation, in practice it denied a measure of stability to the organization. For better or worse, it continued to reflect the state of the AIDS "community" in Syracuse as AIDS activists struggled to define the identity and work of the CSP.

Whether it was these struggles over style and program content among individuals and groups, or the participatory structure itself that was responsible, much of the first eight years of the CSP were spent in administrative turmoil as executive directors quarreled with their Executive Committees and with the Task Forces and it became increasingly difficult to fill administrative positions.

Some of the strains on the operation of the Task Force -- including a rapid rate of staff turnover -- might have been relieved had executive directors had the proper political skills for the position. Unfortunately, they did not. Thus, the woman who assumed the position early in 1988 did not effectively demonstrate those skills. Leaders of the gay and lesbian activist community, in particular, viewed the situation at the time with some suspicion. As one commented early in 1989,

> The scuttlebutt I keep hearing ... is that [she] feels she was hired to 'mainstream' fighting AIDS in this community and that she doesn't feel the necessity to include gay and lesbian concerns as part and parcel of what the Task Force does. There's an effort to have a committee that would handle gay and

> lesbian concerns [within the Task Force]... There are also committees to deal with women's issues, minority issues. It's like the ghettoization of all these groups.

Typically, the Task Force was accused by these activists of refusing to develop and circulate safer sex materials directed explicitly to gay men and lesbians and of not returning calls for volunteers that came from gay men. As one gay informant claimed, "There's a feeling that certain people don't want ... gay men on phone lines."[19]

Some of these complaints were voiced publicly during the city's Gay Pride celebrations in June 1988 when a leader of the gay community talked briefly in an open forum about a growing gulf between the Task Force and the gay community. A few days later, he was contacted by the Chair and Vice-Chair of the Executive Committee about meeting with them. That meeting, as he recalls it, did not prove to be so much an opportunity for reconciliation as for criticism from the CSP's Executive Committee leaders that he had complained in such an open forum.

As a result of this escalating alienation, a contingent of gay and lesbian activists appeared at a Task Force meeting in July of 1988 to air their complaints. The people in charge of that meeting attempted to restrict their access to the floor. Despite that effort, activists were able to raise a number of questions about the content of the agenda, which (among other things) was supposed to deal with proposed by-laws for changes in the structure of the organization. The dissidents succeeded in sending the by-law revisions back to committee for further work. A second meeting came to no better outcome as quarrels over the proposed by-laws were referred back again to committee for review. This opposition clearly reflected a growing concern among activists that the proposed by-laws would move the organization much more in the direction of a hierarchical, "professional" organization than many of the gay and lesbian community activists were unwilling to accept.

Ultimately, these struggles were not only over the direction the organization was taking but whether it would maintain sufficient sensitivity to the concerns of gays and lesbians. Those feelings were put in the following terms by one gay activist:

> We have supported [the Task Force] thinking that what we are going to get in return is a fair delivery of services. We have done that at the expense of our own organizations and our own community resources. For us to be treated as just one of the needs areas to me is ludicrous and insensitive.

Typically, the new Executive Director and the Chair of the Task Force's Executive Committee moved during this period to further strengthen professional representation on the CSP board. While they conceded some representation to gays, minorities, and PWAs (in keeping with AIDS Institute encouragment) they also included seats for county health officers from the nine-county region served by the CSP. Where there was no formal position of county health commissioner, equivalent persons were sought. This professional "outreach" alarmed some gay activists. For, as one commented,

> By taking the course that they are now taking, where the majority of the people on the [board of directors] are professionals and they are getting their salaries, making their livelihoods in health care, it's just ludicrous for me to think that they are going to be responsive to what we really need.[20]

In contrast, the Chair of the Executive Committee (who was herself a staff member of a non-profit organization) commented on the need for professionalization at the time the new Executive Director arrived in 1988,

> Before [she] came, the agency was just about defunct... So these other agencies were saying, 'Until you can be real and credible as a professional agency, we're not going to have anything to do with you.' So a lot of them sat back. Then, there was another group who said, 'I'll get on the board of directors and maybe we can do something about this.' So, you had on the board of directors, people who were saying, 'This is what needs to be done as a professional agency...' And, then, you would have the gay group saying, 'What about us?'

Given the contentious history of the organization up to that point, many of the professionals (both gay and non-gay) associated with the Task Force were supportive of reforms that would concentrate power in a smaller, more professional, board. As the then-Chair of the CSP commented in 1989, in relation to the "general membership" on the Task Force,

> My own preference is that [the] general membership ... need[s] to be there for meetings, but I don't think we need to give them a lot of on-going responsibility... I think the board people are very committed and very interested and put in a lot of time and hours. What we had before is that ... the board could pass certain things, but the general Task Force had the final approval and it just made it kind of ass backwards.

Despite occasional successes in putting the organization on a sounder administrative footing, the Executive Director found herself under continuous fire from her critics. Rather than struggling to overcome that situation, she resigned early in 1989, barely more than a year into her service, when an opportunity arose to assume another position. After her resignation, the board launched a search for a replacement. The selection process was a very difficult one, given the troubled history of the Task Force, the high turnover of its staff and the small budget allocated to it by the AIDS because of the Institute's dissastisfaction with its administrative capacity. Interestingly enough, the person selected as Executive Director had been associated with the "closeted" wing of the gay and lesbian participants in the early years of the organization and then had withdrawn from the organization as it was divided by quarrels. He now came back into an organization where he could draw upon the support of professionals and gay and lesbian non- activists to establish a more narrowly-focused organization which was only marginally responsive to the concerns of the gay and lesbian and issue activists. Within a year, new by-laws had been put in place which established a small board of directors and did away with the large participatory mechanism that had operated up to that point.

Selecting an Executive Director

The evolution in board membership outlined in the previous section is consistent with the service organization strategy that the current generation of executive directors has pursued. That trend has been associated with the bureaucratization and professionalization of the administrative side of the CSPs. In the process, boards and their chairs have become less visible entities than the agency executive directors, who in turn, typically have become more service managers than what might be distinguished as issue advocates and constituency mobilizers.

On the whole, a decade of ASO evolution has seen the passage of organizational leadership from those imbued with personal or ideological commitments to the issue of AIDS -- those we might call issue advocates -- as opposed to those who have emerged from various service backgrounds to take on administrative leadership of the organizations. Their type of leadership might best be characterized as service organization management. In between lie the constituency mobilizers: those who seek to build the organization by mobilizing support from various actual and potential constituencies. Where they stand on issue advocacy, however, is problematic, since they are not necessarily militant on the issues.

As I suggested in the previous section, increasing professionalization and bureaucratization of the CSPs (with the encouragment of the AIDS Institute) has worked to narrow the access and influence of diverse groups that initially served as constituencies for the CSPS: gays and lesbians; organization volunteers; issue advocates.[21] There has also been limited access by self-identified PWAs to decision-making positions. Instead, there has been an increasing tendency toward the selection of service managers to position of administrative leadership in the CSPs who look primarily to two other constituencies for support and validation: the AIDS Institute; and other health care and social service providers within the region.

In some ways these patterns of change have been most clearcut in Albany and Syracuse, where issue advocates who also functioned as constituency mobilizers served as the first executive directors of both CSPs. In Albany, however, the first executive director came into conflict with her predominantly middle-class professional gay white male board over her ideological commitments very early in her administration. She was dismissed. She was followed by a persons with professional credentials whose administrative inclinations became increasingly bureaucratic as time passed. The result has been a narrowing of access and influence by volunteers and dissident voices within the community including PWAs, some of whom complain both about the quality of care they receive under this arrangement and the access they are given to administrative decision-making.

Because of the larger cleavages within which the Syracuse CSP's service delivery has had to operate, it was not until 1989 and the selection of the current executive director that the organization was put on a more consistent bureaucratic basis. As in Albany, there are many complaints about access to services and influence within the organization by AIDS activists. Reflective of that level of dissatisfaction are the efforts of a group of activists to place their

concerns before the board late in the summer of 1993. They had returned from a state-wide PWA conference energized by their involvement there to place a number of demands before the CSP's board. While they were heard with courtesy, I am not aware that any of their complaints have been attended to.

Somewhat different administrative leadership scenarios have operated in Buffalo and Rochester where the lines between issue advocates, constituency mobilizers, and service managers were not as distinct initially and other factors have intervened to complicate the picture since then.

In Buffalo, the gay physician who was most instrumental in creating the CSP sought (in principle) to avoid day-to-day responsibility for operation of the organization. He led the selection process that chose the organization's first two executive directors from his position as president of the board and then continued to exercise influence over the direction of the organization. Some informants contend that this created considerable difficulty for the first two executive directors. The second one, in particular, was both a constituency mobilizer and an issue advocate, and she also had some training as a social worker, but she came into conflict with the board over personal style and managerial shortcomings that became more pronounced as the board added more professionals to its membership.

For various reasons, including the completion of his medical residency and his assumption of responsibility for setting up the first hospital-based AIDS clinic in Erie County, the physician eventually chose to draw back from his commitments to the CSP. He exchanged positions with the treasurer of the board in mid-1985 but then resigned from the board altogether.

By the time he resigned, the founder had recruited a number of gay and lesbian professional service providers to the CSP board. Among them were two gay men who were involved in health- related administration. One was a middle-management hospital administrator; the other was executive director of Planned Parenthood of Niagara County. It was with the latter that the founder of the CSP exchanged the CSP board presidency in 1985. It was this person who played a major part in the dismissal of the organization's second executive director in December, 1986, allegedly on the grounds that she was a poor administrator and spent too much time on building community support for the organization rather than on organization management. (Indeed, it was just these characteristics that endeared her to the CSP's small staff and to many of the volunteers of the organization.)

The new president played a major role in the selection of the hospital administrator as the third executive director. While the executive director claimed to be just as much interested as his predecessor in mobilizing connections into various populations (including gays and lesbians, women and minorities), some observers suggest that he began the trend that led the organization to focus much of its energy on building good relations with the AIDS Institute and with other professional health care and social service providers in the community rather than with integrating clients more closely into the operation of the agency or with mobilizing volunteer and

public support for the organization. When he resigned two years into his service in late 1988, his successor was the president of the board.

Whatever the personal style of the outgoing executive director, under his leadership the values associated with "good" service management were placed much higher in the organization's hierarchy of values than issue advocacy or constituency mobilization. Service management and strong leadership (by which he understood bureaucratic control) were even more highly prized by his successor. As a result, operations have become not only increasingly professionalized but they have become remarkably bureaucratized to the point where internal organizational control and demonstrations of loyalty to the hierarchy have become the dominant value of the organization.

In the process, the role of volunteers -- although publicly celebrated -- has been substantially deemphasized in favor of service delivery through carefully controlled professional staff. (Volunteers, of course, constitute a less controllable form of organization labor than full-time employees.) Such vestiges of volunteer activity as the buddy program, for example, have been markedly de-emphasized in favor of counseling and client management activities provided by full-time staff; educational presentations by volunteers has also been played down in favor of the use of paid staff. Indeed, over time, opportunities for forums between volunteers and staff have been reduced and volunteers and other interested members of the public have been discouraged from attending board meetings on grounds of confidentiality.

A rather different situation arose in Rochester where the person selected in 1984 as the first executive director of AIDS Rochester Inc. (ARI) had shortly before that served as president of the leading gay and lesbian organization in the community. While she had devoted considerable time as an ARI volunteer in its formative months, she had no professional background in health or social services. However, she proceeded to mobilize the support of the community (beyond gays and lesbians) and to build an organization which came to be seen as a powerful voice of concern on AIDS issues in the Rochester area and as a major vehicle for delivering AIDS-related services. The stability and continuity she provided to ARI as executive director over the next five years made ARI an important organizational model for other upstate cities.

Thus, at first appearance, Rochester succeeded in moving rather smoothly from mobilization around the AIDS issue into and through subsequent stages of organizational development. It grew in staff size, in funding and in the range of services it provided during these years. Nonetheless, by the middle of 1988, complaints began to surface about its operations. Complaints came, in particular, from two sources: first, a group of gay white PWAs felt that their problems were not being given the attention by the organization they felt they deserved; and, secondly, various professionals, including gay and lesbian professionals (some of whom were either board members or former board members but many of whom were political activists) argued increasingly that the Executive Director's lack of managerial skills had begun to hurt the operation of the organization.

As in Syracuse, the first set of complaints reflected a concern that the claims of the gay and lesbian community were being shortchanged as more resources were being directed toward education in the African-American and Latino/a populations, as well as toward IV drug users, and to heterosexual women and infected children. Whatever the reasonableness or unreasonableness of these complaints, it was generally agreed in the activist community that one of the more damaging symbols of the Executive Director's obstinancy was her unwillingness to seek out an openly-admitted gay or lesbian PWA for membership on the board as late as 1989. As one gay activist commented in the Spring of 1989 in this connection,

> They don't want a PWA on the board. PWAs have been practically on strike to get on the board... [The] organization felt it was going to disrupt their well-run agency, which isn't so well run. They have taken on a real bunker mentality.

This kind of distrust was even reflected in the emergence of a controversy between PWAs and the agency over the use of ARI facilities for meetings and "drop in" sessions. Thus, despite the fact that the Executive Director and most of her staff members came from the gay and lesbian community, several informants pointed to examples such as these as evidence of the organization's increasing alienation from PWAs and from the gay and lesbian community.

An equally large share of the dissatisfaction with ARI appeared to stem from the managerial style and the lack of administrative competence of the organization. Along with this complaint, there was growing discontent in the gay and lesbian community (as well as among non-gay professionals on the board) that the Executive Director had come to treat ARI as a personal fiefdom and to brook very little dissent from board members. Thus, while applauding the impact of her public persona in helping to spreading the message about AIDS among the general public and in gaining financial contributions to the organization, these critics became increasingly vocal about her limited organizational abilities (including the organization's shortcomings in maintaining personnel records and managing funds) as well as her lack of professional credentials. Indeed, the lack of credentials provided some of them with a relatively "neutral" instrumentality for attacking her leadership while staying away from certain behavioral issues that they felt were best left out of public view. As a former board member remarked in an interview in early 1989,

> There have been many of us ... who have left the board because we simply felt that the organization had outgrown [the Executive Director] and [she] couldn't keep up, and yet she simply refuses to allow any criticism or any openness at all. She continues to try to dominate the board and everything else and some of us became so alarmed at what was going on and saw that it was hopeless to stay and fight that we simply left.

It is not necessary to review in detail the events that led to the firing of ARI's Executive Director in July, 1989 after several months of maneuvering between her and her opponents. One highlight was a board meeting held in October 1988, where there was an especially heavy

turnout of former board members who read a letter listing a variety of complaints about managerial matters. Although some of her critics claim that the Executive Director ran the board with an iron fist, the fact that a majority of members of the board were sympathetic to the position of the dissidents and were willing to give them access to the meeting is, itself, indicative of the limits of the actual power she was able to exercise in this situation.

One result of the airing of these grievances was the formation of a committee to review the structure and activities of the organization; another was the voiding of elections to the board and a move to hold new elections in January, 1989. Those elections brought on to the board new people who included some critics of the incumbent administration.

While the new board attempted to establish a working relationship with the Executive Director, over the next several months they put her work under increasing scrutiny. This led ultimately to her being fired in July amidst displays of anger and threats of legal action from her side. Three days later, seven staff members either resigned or were fired.

While complaints of managerial incompetence came from a number of critics, a few who were closely questioned on the issue insisted that they wanted an organization that was professionally managed but was not marked by the autocratic leadership style of the outgoing Executive Director. For, while the CSP under the former leadership had succeeded in establishing and maintaining a degree of bureaucratic control of organizational operations, it had become too dominated by one person who stood at the apex of the organizational hierarchy, and demanded too much personal loyalty to herself on the part of the staff while being incapable of taking a sound professional approach to the management of the organization.

One of the more neutral observers of these events -- a person politically active in the gay and lesbian community -- put the problems in terms of both the personalities and managerial issues involved when he described the former Executive Director in the following terms:

> [She] is very forceful, very forthright, very outspoken. [She] can also be very stubborn... [P]ushing to get that budget and pushing to get that organization done and bamboozling people into things is real important. As you move on, as you grow, you need a lot more mediation skills... as more people come in and feel part of it and so I am not surprised that [she] would butt heads with people.

With the firing of the Executive Director and the turnover in the rest of the staff, the CSP was left with a skeleton crew through the Summer and Fall of 1989, but the need for the organization and the support that still existed for its reconstruction led to a quick revival of ARI operations. The board of directors elected earlier in the year remained in office and proceeded to select a new executive director, a straight woman with a background working in both health and social service organizations. Most recently, she had served as Executive Director of the local unit of the Heart Association; before that she had been associated with a local mental health services organization. In her time in office, she has been careful to build good relations both

with members of her board (and with the "interests" they represent) and with the larger community -- including the politically influential gay and lesbian population of the metropolitan area. As a result, relatively few of the tensions apparent in the three other cities currently appear to exist. It may be overstating the case, but ARI seems to be closer to a model of democratic accountability than can be found in the other cities, although it is as professionally managed as any of the others.

In this section, thus far, I have traced some of the factors which have worked to limit the acountability of the CSPs by focusing on what might be viewed as the critical governance structures of these organizations: their boards of directors; and their executive directors. As the literature of public administration and organization behavior has long indicated, the relationship between the two is itself problematic,[22] though how the structuring of that relationship may have an effect on the accountability to wider social forces is open to question. In principle, boards and executive directors should be capable of operating as equals in matters of policy and public accountability, but studies of many organizations both in the private sector and in governmental agencies that have boards have shown how executive directors may come to dominate their boards. Such behavior is apparent in at least two of the four cities studied where the current executive directors tend to play major roles in the selection of new board members and in setting general policy for the board. Indeed, in three of them, the executive directors are much more visible than are the presidents of their boards or individual board members. (In Rochester, there is somewhat greater parity in the relationship between the board and the executive director.)

Two Approaches to Accountability

One of the more troubling issues in dealing with the subject of accountability is developing an adequate set of responses to the question, "To whom are the CSPs accountable?" In a highly fragmented political system like our own, a measure of accountability of non-governmental entities might be achieved through: 1) vigorous oversight by democratically-elected governmental bodies -- particularly legislatures -- or by their executive surrogates, acting in the name of the public to produce changes in organization behavior or policy where appropriate; or, 2) or, mobilization of a series of interested "publics" or "constituencies" capable of providing a check on the behaviors of the organizations. In practice, both kinds of mechanisms have serious shortcomings. Nonetheless, the small measure of accountability that does exist within the AIDS policy system owes something to the presence of both types of accountability mechanisms. In this section, I wish to address briefly the role of government oversight (and particularly the part played by the AIDS Institute) and in the next section to deal with some aspects of the problem of constituency mobilization and development in relation to the CSPs.

The Limitations of Government Oversight

As we noted earlier, local government officials have chosen to be largely absent from the AIDS policy arena. A few may show up on symbolic occasions like AIDS Day commemorations or at openings of new CSP offices or other AIDS-related facilities, but the state's assumption of the primary responsibility for funding the CSPs has allowed local politicians to flee

involvement in an area of public policy that might be considered too controversial in these relatively conservative parts of the state.[23]

Similarly, many local school districts (in both urban and non-urban areas) have been wary of taking on responsibility for preventative education which might have been expected to be a major area of responsibility. While a few upstate urban and suburban school districts have been forthcoming on the issue, most have sought to avoid the inevitable conflicts that might follow complaints from conservative Catholics, and Christian and Jewish fundamentalist groups about explicit safer sex education. Besides developing a curriculum and "recommending" the adoption of that curriculum to school districts, the state government's Board of Regents -- its highest educational authority -- has been hesitant in the initiatives it is willing to take in these matters and the state legislature and governor have been noticeably absent from this debate.[24]

Whether by intentional default or not, then, leadership on AIDS policy and programming other than educational policy has been left to the AIDS Institute, which has been relatively insulated from local political influence and only intermittently affected by the behaviors of the state legislature.[25] The location of the Institute within the state's highly-bureaucratic and highly professionalized Department of Health has allowed it considerable autonomy. For the most part, the charge (whether implicit or explicit) that has been given to the AIDS Institute has been to maintain state-funded AIDS services in such a way as to minimize political controversy. This has meant, for example, keeping the educational presentations given and materials prepared and distributed by the agency (and by the CSPs) as non- controversial as possible, allowing for some variation among different parts of the state and among audiences to whom the materials and presentations are given.[26]

It is not clear to me how much this message of bureaucratic caution is conveyed explicitly to the CSPs by the Institute or is the reflection of a natural caution of the professional leadership of those organizations themselves. Certainly, on the financial front, the Institute has maintained regular and close supervision of the operations of the agencies by requiring them to document in considerable detail every cost and every expenditure they undertake.

Complaints from informants in the CSPs were particularly commonplace during the early years of the agencies when they had neither the personnel nor the bureaucratic mind-set necessary to expend the enormous time and energy required to keep up with the stream of reports and funding applications required by the Institute. These complaints have receded as the administrative infrastructure of the CSPs has grown (along with the Institute funds used to support the proliferation of administrative staff) and as the CSPs themselves have become more self-conscious bureaucracies. At the same time, those involved in the system appreciate that charges of misuse of funds has been kept to a minimum during the nearly ten years of state funding of CSPs.

Associated with requirements for fiscal accountability, the Institute has maintained performance oversight of the CSPs by requiring them to set specific program goals on an annual basis and then by monitoring CSP operations to assure that they are meeting those goals in order

to qualify for funding renewal.

While such an approach encourages CSP accountability to the Institute, there are questions regularly raised by observers of the system about the accountability of the Institute itself and the way the state-level AIDS policy system operates in New York. Unfortunately, this is a subject that has not been studied systematically and one which I have not focused on in this research. Furthermore, it is a system much more driven by the needs and pressures emanating from the New York City metropolitan area with its overwhelming AIDS crisis than from the upstate regions we have been considering.[27]

Nonetheless, there is some evidence that the leadership of the Institute has been highly sensitive when necessary to the political currents in which it finds itself. Thus, when the Syracuse CSP was threatened with probation in 1989 because of problems in administrative performance, the intervention of a powerful State Senator from the region allegedly prevented that from happening and contributed to helping the new executive director get the organization back on an acceptable track for state funding support.[28]

Similarly, the Institute has been sensitive to pressures from minority members of the state legislature during budgetary negotiations about making resources directly available to community-based organizations (CBOs) within the African-American and Latino/a communities to support services directed toward those populations. In 1992, there was also serious discussion about making new funding available to minority CBOs which might have led to the creation of a set of minority organizations running parallel to the CSPs. While the CSPs were unhappy about the possibility of this coming about, the minority caucus in the state legislature pressed for such a strategy. As of 1993, however, such organizations have not emerged in any measure in the upstate regions studied here. (I cannot speak to the role the growing number of minority AIDS-related CBOs may be assuming in the New York metropolitan area.)

On another dimension, the Institute (either on its own or as a result of pressures from within the Cuomo administration) has sought over the years to encourage a measure of accountability within the CSPs. This has taken several forms. We mentioned pressures for enhanced representation of PWAs, minorities, and outlying areas on boards of directors in an earlier section. There has also been encouragement for the recruitment of minority persons to CSP staffs.

Yet another approach to accountability has involved encouraging the CSPs to develop and employ quality assurance measures. These essentially ask clients of the agencies (and others with whom the agency comes in contact like the audiences at educational presentations and volunteers at training sessions) to respond to questionnaires reporting their levels of satisfaction with the agencies. The use of such an approach is consistent with notions of total quality management which have emerged in the past decade within public and private management.[29]

A few CSP informants allude to the use of such measures as evidence of accountability and suggest that the results are reviewed and acted on by quality assurance committees. On the other

hand, critics contend that such committees rarely meet and that the data is collected and analyzed in such a way as to be relatively useless. Indeed, some claim that unfavorable responses tend to be suppressed, or that responses are solicited only from those likely to be favorable to the agencies with the result that quality assurance measures have been a less effective way for assuring accountability than their advocates hoped they would be.

On the whole, accountability to the Institute has meant financial and procedural accountability, the latter involving the formal goal-setting and goal-achievement activities mentioned earlier. In contrast, the Institute has been wary of intervening too openly in the internal governance of the CSPs beyond encouraging the addition of certain types of representatives to the boards. What the Institute has not pursued through explicit intervention, however, has been achieved in small measure and unsystematically through the encouragement its officials have sometimes given to dissident voices in the four regions. Before discussing that style of intervention, it is useful to review the recent condition of constituency mobilization and development at the local level.

The Problematics of Constituency Accountability

Along with the formal accountability relationships that exist between the CSPs and the AIDS Institute, there is a sense in which non-governmental organizations like the CSPs operate selectively to recognize or not recognize their relevant publics by the way their leaders choose to interact with various individuals and groups in their organizational environments. This form of accountability is clearly a more tenuous one than the more formal processes touched on in the previous section, but it touches on the analytical problems involved in trying to describe the factors that influence (or fail to influence) the practice of organizational accountability.[30] It also admittedly leads us into the intellectually murky territory of dealing not only with the actual constituencies with which the leaderships of the CSPs may choose to interact but with those potential constituencies to which the CSPs might be expected to bear some measure of political accountability if they were effectively mobilized.[31] To further complicate matters, it is very difficult to draw the line for the purposes of the present discussion between relevant and non-relevant "publics" (whether expressed in the presence of mobilized population segments or not), so that the "interests" discussed in this section are in some sense included only arbitrarily.[32] However, that very fact points to the difficulties involved in "constructing" an effective accountability system either in theory or practice under which the CSPs or other non-governmental organizations might work responsibly.

The most obvious constituencies for CSP activities consist of four analytically distinct categories which overlap considerably in personnel: 1) clients; 2) PWAs; 3) gay and lesbian activists; and 4) volunteers. Yet, each of the CSPs has had difficulties dealing with these segments of the population in the past.

As we have already noted, each CSP has had to contend with issues arising from the character of relations with PWAs and with client populations. While there is a considerable overlap between the two categories, the point to be made here is that not all agency clients are

PWAs. A small portion are family members and lovers of infected persons who make use of support groups and other agency services to deal with their grief or to deal with other needs related to the PWAs but they may not or may not be energized by their feelings to participate in efforts to influence the operations of the organizations.

On the other hand, a segment of the local PWA population is sufficiently dissatisfied with the quality of interactions with agency staff or the character of agency services so that they seek to meet their needs outside the agency. Many are former clients of the agency; some do not bother to seek services from the agency because they have heard negative things about it or because they have the skills necessary to gain access to the services they need without the agency's help. Still others may use agency services selectively when it serves their purposes, but they will also make use of other personal and organizational resources when they are available.

Curiously enough, the CSPs have not consistently used their clients to build a political support base for their organizations even when those clients include articulate gay middle class men with professional skills. Instead, as we have noted, the organizations' responses to clients and PWAs has taken the symbolic route of occasionally adding (sometimes "token") PWA members to their boards or providing social events (including lunches; parties; outings) for clients. While systematic efforts to keep clients from using CSP facilities have occurred only in a few situations, a number of clients in different cities point to the feeling of not being welcome if they drop in at the agency rather than having a scheduled counseling appointment or support group. There also appear to be few mechanisms by which the CSPs are forced to hear their complaints, whether they act upon them or not.

As a result, an implicit division of labor has emerged in which alternative PWA organizations have been created to provide certain kinds of social supports of a kind the CSPs are not willing to take on ("drop-in centers;" meal services; social activity groups; exercise and alternative therapy sessions; sometimes, counseling and case management opportunities). While the CSPs will sometimes work on projects with these PWA organizations, coolness or overt conflicts have also characterized their relations.

Instead, the CSPs have come to play the classic role of caregiver to the compliant client. In an era when clients of health care and social service agencies are increasingly acting as informed "consumers" of services who question the advice given to them by professionals and are seeking to participate in the decisions that are made about the delivery of services, at least three of the CSPs (I am not as sure about the current Rochester situation) seem to be engaged in reinventing bureaucratic forms of relationships between clients and care-givers of the kind that have been under attack in the organization theory literature for at least twenty years.[33] Furthermore, the dissident client -- the one who expresses reservations about the quality or content of the care he or she is receiving -- is discouraged from seeking help from the agency because he or she is viewed as being too disruptive.[34] In some cases, that kind of client may also be the one who helps to build alternative organizations and in some instances serves as a support base for

criticism of the CSPs.

The last few years have also witnessed the increasing attenuation of connections between the gay and lesbian populations in the four service regions and the CSPs. This is, in part, a result of the shifting character of the disease as heterosexual men and women have come to constitute a growing minority of CSP case loads. Yet, in each of the upstate communities, gay and bisexual men still constitute the majority of current clients. Staff positions in the agencies also continue to be filled by gays and lesbians, though the agencies vary in the extent to which they acknowledge that fact or make an effort to publicly acknowledge the concerns of gays and lesbians.

In varying degrees, the leadership of the CSPs has sought to benefit from the financial support that gays and lesbians have provided to the organization through various fund-raising events and individual contributions (including United Way checkoffs) but they have sought to hold the activists from that population at bay. The result is a sort of organizational -- and personal -- ambivalence on the part of CSP leadership in which the linkage is encouraged for reasons of financial and social support but discouraged on other fronts. Complaints abound, for example, about a decline in efforts to reach gays and lesbians with safer sex presentations and, more specifically, with the lack of condoms and gay-relevant educational materials at bars, bookstores and other places where gay men and lesbians congregate.

At the same time, there are occasional concerns expressed by gay and lesbian activists about the reluctance of CSP leadership to play "gay-positive" roles in their communities. This tension takes different forms in different places and also reflects the level of organization of the gay and lesbian community in each place. Oddly enough, it is least visible in Rochester, where the straight woman who heads the CSP appears to work comfortably with gay members of her staff and with gay and lesbian organizations in the community. In contrast, it continues to be an issue of some significance in Syracuse and to an extent in Buffalo. Reflective of the atmosphere in the latter city, a minor controversy arose in 1991 following the publication of a story in the city's general circulation newspaper when a casual remark by a community activist was taken by the Executive Director as an effort to "out" him. The result was a certain amount of sniping within the gay and lesbian community between the two sides. In an era of increasing emphasis among gays and lesbians on "coming out of the closet" as a sign of self-respect, the Executive Director's behavior was hardly likely to win esteem for him in gay and lesbian activist circles, whatever support it may have won from the closeted.

And, indeed, that is part of the evident ambivalence of the CSPs with respect to mobilizing their gay and lesbian constituencies in Albany, Buffalo and Syracuse. They are more than willing to employ the professional talents of gays and lesbians in staffing their organizations and they are eager to draw on the financial resources that gays and lesbians can provide, but they deal gingerly with community activists. The result is that even while closeted gays and lesbians fill staff and board positions, activists tend to be invisible in the organizations.[35]

Discomfort with activism and activists is not confined to gay and lesbian activists, because

the CSPs have also had difficult relations with units of ACT UP during periods when that group has operated in the four communities. While not exclusively gay and lesbian, ACT UP groups have drawn together AIDS activists from various backgrounds including gays and lesbians, non-gay PWAs and AIDS issue advocates. These are the kinds of people with whom the buttoned-down leaderships of the CSPs are notably uncomfortable, even though on occasion they may express some admiration for the pressures ACT UP can bring to bear in advocating on various local issues from the provision of safer sex education in the schools to the introduction of needle exchange programs.

If, at a minimum, the CSPs have been forced to contend with issues touching on relations with PWAs and clients, on the one hand, and with gay and lesbian activists, on the other, they have worked fairly steadily to weaken the influence of what might be described as non-elite volunteers and any accountability the organization may owe them. Thus, while the four CSPs continue to make use of the contributions of time and energy (and money) by volunteers, bureaucratic and professional tendencies within the organizations have had the effect of constraining the role of volunteers. This has come about in several ways.

First, except for the Syracuse CSP (for a time), notions of democratic participation in organization decision-making have never been particularly strong in the other three CSPs. The organizations in those cities were all formed by small numbers of volunteers drawn mainly from the gay and lesbian community, but they all became narrowly controlled over time. Save for Syracuse, there was no notion of general membership in the organizations.

From the outset, of course, voluntarism took two forms. First, there were elite volunteers who played roles of varying importance as members of CSP boards of directors. However, memberships on these boards were self-perpetuating and were influenced either by the preferences of the founding board leaders or by increasingly powerful executive directors. Opportunities for participation in decision-making by non-elite volunteers was not very evident in these organizations. Instead, the notion developed that most volunteers -- no matter what the level of their skills, experience or credentials -- would play a support role (of varying importance) to professional staff in delivering the services of the organization.

Thus, while the AIDS Institute continues to support the "ethos" of volunteerism by collecting measures of volunteer labor in assessing various aspects of the work product of the CSP, and uses those measures as one of a number of indicators in providing funding to the agencies, the reality is that there has been an increasing marginalization of most volunteers in the CSPs insofar as organizational accountability and access to decision-making is concerned.

In part, this reflects changes in the nature of the disease, in its treatment and the way services are understood to be delivered best. Originally, the educational and support service activities of each of the organizations were not seen as requiring more than a limited training program to prepare volunteers for participation in the work of the agency. As the services required have become more complex and demanding, the work of the volunteer has sometimes been reduced to little more than clerical support and participation in the preparation of

fund-raising events. The "buddy" function, once regarded as emblematic of ASOs' work (when most clients were gay middle-class white men) necessarily has been played down as the proportion of minority intravenous drug users has grown. (Many of these clients bring to the client-agency relationship multiple personal and family problems of great complexity.)

Each of the CSPs continues to struggle with the best uses to be made of volunteers. The greater the number of staff members, the more it is likely that the volunteer will become vestigal to operation of the organization. Nonetheless, the volunteer base of the agency has both a symbolic and a substantive set of uses that makes it unlikely that the use of volunteers will end in its entirety. Substantively, there are still important needs not being provided by the staff of the agency which volunteers can cover (including buddy-related activities where a demand still exists). Symbolically, the presence of volunteers as an integral part of the CSPs provides the organizations with a measure of autonomy and legitimacy that they might lack if they were simply the creatures of the AIDS Institute. Thus, the CSPs continue to honor their volunteers (through parties and picnics and various forms of individual recognition) and to draw upon their services, even as their ability to influence the direction of the organization -- serving as a "grassroots" base for the organization -- has become less meaningful.

Less need be said here about five other actual or potential CSP constituencies: 1) minorities (primarily African American and Latino/a); 2) intravenous drug users (IVDUs); 3) women; 4) interested persons and groups in geographically peripheral areas; and 5) other health care and social service organizations. Each of these target groups might merit detailed treatment in its own right, but here we will simply point to the nature of the challenges represented by these groups or interests and indicate how one of more of the CSPs have responded to them.

When this research began in late 1988, the CSPs appeared to have very few connections into minority racial communities (principally the African-Americans and Latinos/as) in their respective areas. They reported very little interest among minorities in volunteering for the organization and great difficulty recruiting minority staff to the CSPs. Most admitted that their predominantly gay and lesbian white organizations were probably not attractive environments for those few minorities who showed an initial interest in volunteering or working for the CSPs.

The argument frequently advanced by leaders of the CSPs for their lack of success in delivering the AIDS message to minority communities was that their message was being blocked by the culture and institutions of those communities. In the case of African-Americans, the conservative nature of many local churches made it difficult to reach the community; other indigenous institutions (including media), and political leaders were reluctant to take on the issue.[36] Similarly, for the smaller Latino/a populations in the four regions, the opposition of the Catholic Church and the prevalence and acceptance of attitudes influenced by "machismo" created barriers to communication with these communities.

Despite their relative lack of success in mobilizing minority community participation prior to about 1990, the CSPs viewed with some disappointment a decision by the AIDS Institute to undertake educational outreach to those communities through instrumentalities that had stronger

holds within the minority populations. Thus, the Buffalo CSP was by-passed in favor of two minority community organizations and the local chapter of the Red Cross when it came to funding pilot programs for minority education in 1989. A staff member of that CSP described his reaction to this decision, particularly with respect to funding of the Red Cross, in the following terms:

> We should have gotten the grant, but politically I think the state has decided that minorities will not deal with anything that has gays in it, so that they are not going to fund [us doing that]. I think that is reality on their part, but I am not sure it is the most effective way to spend money.

Save for Rochester, the addition of minority staff and the inclusion of minority representatives on boards did not seem to have a major impact on drawing significant minority community participation to the CSPs. This problem continued to exist even as client loads from minority populations began to increase dramatically after 1989 and more serious efforts were made to add minority staff. What minority staff there are -- and there are an increasing number in each of the CSPs -- have tended, however, to be primarily at the middle or lower levels of the organization rather than in decision-making positions.

Something of an exception to this situation occurred in Rochester where an African-American woman associated with a community-based health center that served largely the African- American community became Vice President of the CSP in October 1988 and, then, President. She held that office at the time that the executive director was replaced and clearly continues to play a significant role on the board down to today.

In the last three years, a number of minority-based CBOs and health care institutions serving minority populations (as well as the Red Cross) have increased their concern with AIDS education and with the provision of support services to persons infected with HIV, but they have proceeded somewhat independently of the CSPs. In some instances, they have developed their own institutional capacity to provide services or they have linked PWAs with various service organizations (including the CSPs) but they have not sought to integrate their efforts directly with the CSPs. In some measure, this may be a reflection of a kind of "turf war" that has developed between the CSPs and other service delivery organizations in their environments over the issue of "who owns" a piece of the AIDS "action".

While cases of HIV infection associated with intravenous drug use have been present in the population of the four communities for the better part of the last decade, only since about 1988 have they become prominent in the case loads and thinking of the CSPs. CSP informants generally argue that IVDUs are the most difficult clients to work with, whether it is in terms of monitoring their behaviors or providing services (including the services of buddies). Even where the CSP may provide support groups or individual counseling, it is not uncommon for the IVDU to "backslide." Indeed, one of the more controversial policies adopted by at least one of the agencies involved a "tough love" approach in which the agency would withdraw services where non-compliant IVDUs refused to abide by the rules of personal care, appropriate medication and

"clean" behavior in relation to the use of services agreed upon with the agency.

At the same time, it is not clear what the four agencies are doing to more effectively "outreach" IVDUs in their communities. Proposals for vans to circulate in high user areas do not appear to have gotten very far (except in Rochester). Given New York State's mixed messages about supporting local needle exhanges, the CSPs have been slow to assume responsibility for encouraging such activities and have not even been very aggressive in distributing bleach kits in inner-city neighborhoods. Typically, the Buffalo CSP was well in the background when the debate arose in Buffalo in 1992 over an effort to promote needle exchanges undertaken by the local unit of ACT UP.

Such voices as IVDUs themselves have in the provision of services and in the governance of the CSPs are largely mediated through representation by persons from agencies which serve that population. How much those persons who sit on the CSP boards or interact with CSP staff truly speak for the IVDU population is itself problematic. Like other PWAs -- except for those who have the skills necessary to get some of their needs met within the organization -- they either accept what the organization is prepared to give them or seek to meet their needs elsewhere.

Greater attention to the needs of women infected with HIV only began to be given around 1991. The Syracuse CSP had a Women's Committee (along with the many other committees that made up the earlier Task Force) for at least three years in the mid- 1980s. Rochester's CSP, led by two women since its founding, has paid some attention to women's health concerns in relation to AIDS. Still, despite suggestions from the AIDS Institute, this is not yet a major area of concern that has significantly conditioned the organizational activities of the CSPs, though that situation may be changing in light of the growing number of cases among women (including many women with children).

Throughout this paper, we have focused implicitly on the operations of the four CSPs within their core metropolitan areas, where most of their clients are located, rather than looking at the services they provide to their regional peripheries. Yet each of the four CSPs is at the center of a multi-county region covering from eight to fifteen counties.

Until relatively recently, public health agencies in many predominantly rural counties have admitted the presence of only a few cases of HIV infection among residents (aside from the substantial prison populations from elsewhere in the state that have been housed in some of these counties) and have sought to minimize the need for those residents and service delivery agencies to receive significant training and support services. In the last three years, however, all of the CSPs (spurred on by the AIDS Institute) have moved to increase their presence in outlying areas through the establishment of satellite offices staffed by agency personnel and by efforts to establish and assist county- level task forces (usually consisting of local health care and social service professionals, as well as some local volunteers) to provide appropriate local services to the extent possible.[37]

Obviously, as the number of cases of HIV infection continues to grow, the CSPs will continue to struggle to define their own responsibilities to persons in outlying areas and their roles in working to set up and coordinate responsibilities with local health and social service providers within those sub-regions. However, thus far, the efforts of the CSPs and their satellite offices do not appear to be "demand-driven" (except by occasional clients or volunteers who highlight the problems involved in meeting service needs in the regional periphery). There is also an interactive effect of adding county representatives to CSP boards, since such representatives may initiate or reinforce efforts to disperse services to the areas they represent. At the same time, those who represent the outlying areas tend to be either county health officials or representatives of health or social service organizations who approach issue advocacy with respect to AIDS with the greatest caution.

From their origins as organizationally isolated volunteer- based organizations in the early 1980s, the four CSPs have sought to establish their legitimacy with existing social service and health care agencies -- those organizations with which they must necessarily deal in the course of delivering services. For various reasons, many of the "mainline" organizations in each community were initially reluctant to become involved in such interorganizational relations. In some cases, the personalities or management styles of the first CSP leaders may have had something to do with it; in other instances, homophobia or reluctance to be publicly associated with AIDS may have been a factor.

Over the past decade, a variety of bilateral interorganizational relationships have evolved in each region. In particular, most clients of the CSPs make use of local health care facilities, normally the designated AIDS Care units (usually the principal public or teaching hospital in the area) for both primary and more advanced medical care. Similar relations have also developed in most places with local service agencies including county Social Service departments, child and family services agencies and with agencies that run alcoholism and drug abuse programs. As a result, the CSPs have become part of local interorganizational networks, though individual service providers (especially independent physicians and dentists) have continued to be uncooperative in providing adequate services to clients.

Such participation has granted a measure of professional legitimacy to the CSPs, which their current generation of professional managers seems to prize, but at a certain price. That price is their conformity to norms of "mainstream" professional organizational behavior. In a sense, they have become victims of their own success, so that the price of their growth is acceptance of a circumscribed advocacy role within their regions. As noted earlier, for example, while the Buffalo CSP has been well aware of the abysmal performance of the Buffalo Board of Education in providing even minimal sex education (including education about the prevention of HIV infection) in the schools, it was not until 1991 that it came forward on this issue and then only as part of a coalition with other groups concerned about sex education.[38] Furthermore, the issue received major publicity in Buffalo not because of the work done by the CSP or by the coalition but because of the publicity given to the issue by the local chapter of ACT UP.

Another front on which the CSPs have sought to build good relations with other "establishment" organizations is in regard to entree to United Way systems of fund raising. By the early 1990s, each of the CSPs was either a listed agency under the terms set by local United Way (or United Way-type[39]) or had access to funding through procedures by which contributors could take the initiative in designating the organization. In the course of qualifying for such participation, the CSPs have had to conform to various United Way guidelines.

These efforts at professional recognition constitute in their own right a form of accountability, but they do not assure that the CSP is universally accepted as the lead agency in its own region on matters related to AIDS. The degree of acceptance varies with the region. In some measure, ARI appears to be the premier AIDS service organization in Rochester (though the major roles in health care are played by Strong Memorial Hospital and a community-based AIDS clinic, the Community Health Network). In contrast, the Buffalo CSP is probably the least influential of the four in its own region, though the existence of other ASOs does not serve as a direct source of accountability. The two other CSPs fall somewhere in between on AIDS issues.

Emblematic of the level of antagonism that currently exists in the Buffalo region, there was a considerable struggle in 1991- 92 over the design and membership of a new AIDS Network, one of whose responsibilities was to recommend to the AIDS Institute projects to be funded through federal money provided to states under the Ryan White Act. In all of the regions of Upstate New York, the initial funding reviews and recommendations were to be siphoned through local health systems agencies, whose primary responsibility is regional health care planning. In most of the regions, this process was conducted in relative harmony. In the case of the Buffalo HSA, the committee created to review the various proposals (made up of a variety of persons involved in a range of health and social service agencies) pointedly chose to deny funding to the sizable request submitted by the CSP.

About the same time, members of a previously ineffective HIV Care Providers Consortium found themselves under assault from outspoken members of a local PWA organization and from the Buffalo unit of ACT UP for failing to undertake serious efforts to identify and plan for ways to fill existing gaps in the delivery of services to HIV-infected persons. For the most part, members of the Consortium were persons employed by health or social service agencies. The PWA group and ACT UP used the occasion provided in late 1991 by plans to develop new by-laws for the organization to raise issues about representation of PWAs, and other interested communities (including minorities and women) on the board. The result was a highly conflictual process in which the old Consortium was replaced by a new HIV Care Network in early 1991 representing a diversity of areas and organizations within the Buffalo CSP region. Significantly, a majority of persons in the group did not necessarily look favorably upon the operations of the CSP. The Network, in fact, has produced little more than its predecessor in terms of improvements in service provision or filling existing gaps in services, but it continues to reflect antagonisms toward efforts by the CSP to play a leadership role. This is partly because of the efforts of the CSP to block its initatives, but also because of turf wars among its other members.

In this section of the paper, we have identified and reviewed the character of some of the real or potential "publics" or "constituencies" that exist or might exist for the work of the CSPs. Except for relations with established health care and social service agencies, however, the reality is that those interests are rarely mobilized well enough (even allowing for the mobilization in some places of PWAs and gay and lesbian activists) to overcome significant tendencies toward centralization of power in staffs and boards.

The result has not necessarily been domination of the AIDS policy sector by the CSPs, however, so much as the emergence of challenges to their influence through processes of what might be called pluralization. As the next and final section of this paper indicates, a kind of ungainly and apparently unintended accountability system has been created after a fashion in New York State through the development of organizational alternatives never anticipated in the early years of the AIDS crisis and through the role that the AIDS Institute has chosen to play in the development of AIDS policy and funding ASOs in the state.

The Intended and Unintended Consequences of Pluralization

Finally, I want to turn the question asked at the outset of this paper around by asking not "Who Owns AIDS Service Organizations?" but "Who Owns (Responsibility for Dealing with) AIDS?" There are three points that need to be made in formulating a response to that question: 1) the changing nature of the disease and how it has been responded to in New York State; 2) the pluralization of organizations trying to either provide AIDS- related services or to influence the way those services are being provided by others; and 3) the role the state government (and, especially, the AIDS Institute) has assumed in influencing claims to ownership of the disease.

First, as AIDS has spread increasingly into IVDU and minority populations, new organizations have grown up in New York State (particularly around New York City) to claim a "piece of the AIDS action" and established organizations have found it in their interest to develop new programs or to modify existing ones in order to serve people infected with HIV. While the organizational impact of these trends has not been felt as deeply in upstate New York, some of the same tendencies toward the spread of organizational involvement are beginning to occur there.

Second, during the first four or five years of the AIDS epidemic in upstate New York (approximately 1983-88), the CSPs were the primary claimants for regional "ownership" of the educational and support service aspects of the disease, though in terms of funding and direct client responsibilities, they probably took third place to regional hospitals (and related clinics) and government social service agencies in terms of the expenditure of state funds in responding to the health and welfare consequences of the disease.

While the CSPs continue to play the leading role in the provision of client support services (individual counseling and support groups; case management), they are no longer the exclusive providers of those services. They now operate in an environment of multiple groups engaged in providing some or all of the same services. This has necessitated some divison of labor, for

example, between the CSPs, on the one hand, and minority service organizations and organizations providing services to drug abusers, on the other, in areas like education, counseling and case management. Each of the four core localities has also developed transitional housing or hospice-based services for PWAs outside of the ambit of the CSPs, although Rochester's CSP also operates a small housing for PWAs. (Some of these housing facilities are run by groups which either formally or informally provide other support services, as well.)

While some of these alternative organizations receive a measure of state funding, that source of support is limited in relation to the resources provided by volunteers and private donations (including the fund-raising efforts of gay and lesbians). They also depend in some instances on the support of religious groups. The result of this proliferation of organizations is that while the CSPs continue to receive the largest share by far of state money directed toward the provision of (non-health care-related) AIDS services, their voice in influencing the direction of local AIDS policy generally and in the provision of program services overall has been challenged. Unless they are willing to work cooperatively with other ASOs -- something that ARI, for example, has been more willing to do than has the Buffalo CSP -- with the Albany and Syracuse CSPs falling somewhere in between -- they may lose their primacy as service providers.

Indeed, one measure (though perhaps a weak one) of the level of accountability or accommodation achieved between the CSPs and other ASOs has been their potential adversaries has been the degree to which each region continues to spawn alternative AIDS service and advocacy organizations. Thus, Rochester had a small unit of ACT UP around 1988 -- just about the time ARI was having its greatest internal problems -- but that organization effectively disappeared shortly after the turnover in CSP leadership. A PWA client group within ARI also played some role in bringing complaints against the previous regime, but they, too, disappeared in the wake of reorganization.

Similarly, an ACT UP unit was particularly visible and effective in Syracuse during the period around 1988-90 when the CSP was going through some of its most tangled internal wrangling. Although the unit was out of business by late 1991, an organization designed to serve the needs of PWAs for social support had come into being and was putting pressure on the CSP to be more responsive to their needs. A like situation existed in Albany where alternative advocacy and PWA-run organizations (including a unit of ACT UP) came into existence and then evaporated, but the remnants of these groups by their occasional mobilization continue to put pressure on the CSP for changes in policy or the quality of service delivery.

Not only has a rough kind of accountability (though with varying effectiveness) been achieved from below by this process of organizational pluralization, but the interventions of the state government have also encouraged a measure of indirect accountability through encouragement of this pluralization. Whether intended or not, in the last two to three years, the AIDS Institute has adopted what some might view as a rather Machiavellian strategy for encouraging local system accountability by supporting pluralization. For, while the Institute continues to fund the CSPs at the same or greater levels (given the constraints of tight state budgets), it has also encouraged the development of alternative local organizations.

We have already noted funding initiatives to encourage the development of CBOs in minority populations. For the past two years, the Institute has also been providing basic funding to a PWA support organization in Buffalo (help with rent, office expenses and the salary of the one staff person). What is particularly interesting about that is that the PWA organization has been engaged in political conflict on a regular basis with the local CSP during these years.

In the same period, the Institute has encouraged the formation of a state-wide organization of PWAs called the Living Well Commission in the past two years and has provided some funding to keep the organization afloat. The stated function of the Commission is to identify major needs of PWAs and their families which state and local AIDS service providers are not meeting. Funding levels for organizational operations and the continuous procedural hurdles which the Institute (and the organization itself) have thrown in the way of greater effectiveness suggest, however, that Institute support for this activity may be two-edged. On the one hand, the Living Well Commission and its regional units may be seen by the Institute as vehicles for making the CSPs and other service delivery organizations more accountable to clients. On the other hand, the Commission may be seen as a way of diffusing PWA energies by keeping PWAs tied up in organization-building routines.

These efforts to enhance the role of independent minority CBOs and to recognize and support PWA organizations may also serve the power interests of the Institute because it has turned itself into something of a court of appeals and arbiter for complaints against the CSPs. Thus when activists have sought to bring about changes in local policy -- whether it has to do with the introduction of needle exhange programs or the modification of state Medicaid rules about subsidizing nutritional supplements -- they are more likely to receive a supportive hearing from AIDS Institute personnel than they do from their local CSPs. While the Institute is sometimes more involved in these matters verbally than in terms of actual intervention, its recent style has given significant symbolic support to dissident voices and thus kept an important kind of pressure on the CSPs to be more accountable to interested segments of their local populations.[40]

In sum, while accountability mechanisms for opening the operations of the CSPs to more democratic internal controls -- through board member selections and the way choices of executive directors are made -- are relatively weak in New York State, certain mechanisms of external control, or more properly, external influence are being set in place. These reflect the role the AIDS Institute has chosen to play (partly in response to pressures brought to bear on it by minority legislators and by AIDS activists based in the New York metropolitan area). Thus, while efforts to promote greater accountability through more diverse representation of potential and actual interests has proven largely ineffective for producing CSP responsiveness to interested publics, the role the Institute now seems to be playing involves encouraging the development of a greater diversity of organizations which can put pressure on the CSPs to be more responsive to clients and or they can develop their own service delivery systems independent of the activities of the CSPs.

That still leaves open the question of how much the Institute is itself accountable to democratic forces -- how much it has been taking these courses of action in response to pressures on it from different organized constituencies within the state of New York (including state legislators both as a collectivity and as individuals) or how much it functions as an autonomous bureaucracy intent on building up its own political and administrative authority by taking advantage of tendencies toward pluralization in the AIDS delivery system. Unfortunately, to draw a clearer picture of the motives behind the actions of the Institute would require research that goes well beyond what I have undertaken here.

For an account of 19th century governmental involvement in cooperative undertakings with private and charitable organizations, see The American Partnership (Chicago: University of Chicago Press, 1962). Also see, Michael Lipsky and Steven Rathgeb Smith, "Nonprofit Organizations, Government and the Welfare State," Political Science Quarterly, 104 (Winter 1989-90), 625-48. What is more arguable is how best to characterize these relationships: ones of "cooperation" between government and the private sector (as Elazar would have it); domination by government over private agencies (as contemporary conservatives sometimes tend to describe them); or exploitation of public resources by private interests (as revisionist critics of the relationships between government and not-for-profit authorities, in particular, might suggest). For present purposes, it is unnecessary to address these issues.

2. The opposition of the New York Civil Liberties Union on free speech and freedom of association issues to efforts by New York City's government to pressure the organizers of the St. Patrick's Day Parade into compliance with the demand for gay and lesbian participation in the parade illustrates the dilemmas that can arise in this area.

3. Deil S. Wright defines "fungibility" (rather neutrally) as the "ability to shift or exchange resources received for one purpose to accomplish another" in his Understanding Intergovernmental Relations, 3rd ed. (Pacific Grove, Cal.: Brooks-Cole, 1988), p. 95. While the term is most often employed in intergovernmental fiscal relations, it can also be applied to non-profit organizations which receive grants and donations from multiple sources or different grants from the same source. They then have the capacity to divert those funds to uses which the original grantor never intended as long as they keep a step or two ahead of fiscal reviews.

4. "The Price of Progress," The Advocate, #632, June 29, 1983, 34-35. It is not really on point to suggest, as Jeff Levi of the AIDS Action Council (and former executive director of the National Gay and Lesbian Task Force) does, that such behaviors are characteristic of organizations undergoing "growing pains" because of rapid expansion like the community action organizations of the 1960s. More questionable is a quote attributed to Dr. Mitchell Katz, director of San Francisco's AIDS office, "We have no complaints with Shanti's ability to run housing from a programmatic perspective, but we have problems with their mismanagement of a substantial amount of city money." Is that a distinction without a difference?

5. The traditional legal position on government grants since the 1920s has been that an agreement by a state or local government or by a non-profit organization to participate in a grant program is tantamount to accepting the conditions that accompany that grant. Nonetheless, the power of the federal government to attach regulations to grants to private and sectarian institutions became a lively constitutional issue in the 1980s as a result of the decision of the Supreme Court in Grove City College v. Bell (1984) which held that governmental funding of student financial aid programs was too remote from the operations of the college's athletic

department to require enhanced expenditures on women's athletics. That triggered Congressional efforts to reverse the decision through passage of the Civil Rights Restoration Act of 1988, which was passed over President Reagan's veto. We are likely to see a number of cases in this area when issues are raised with respect to implementation of the Americans with Disabilities Act of 1990 and the various state and local anti- discrimination laws passed in recent years protecting gays and lesbians against discrimination in housing, public accomodations and employment.

6. As part of the arrangement by which they became Community Service Programs, the four organizations assumed responsibility for providing services to multi-county regions. As a result, while their main offices are in the central cities mentioned, and the bulk of their services are provided to persons in their immediate metropolitan areas, they also are expected to maintain services for regions which cover from eight to fifteen counties. In responding to that need, they have established satellite offices in some of the outlying counties in the last few years.

7. The responsibility for public health programs in New York State is a county function, but county governments throughout New York State have been reluctant to become actively involved in AIDS-related activities, even in regard to running vigorous education and prevention programs. While a few counties have hired AIDS educators, most county administrative heads and county legislatures have been notably silent on AIDS matters, except when provoked into action by local AIDS activists. Much the same can be said for the schools districts of New York, which (with a few notable exceptions) have been slow to adopt a state- recommended AIDS curriculum approved by the State Board of Regents in 1988.

8. For more detailed accounts of the development of the four CSPs, see my "Dilemmas in the Development of AIDS Service Organizations in Upstate New York," Paper prepared for delivery at the 1990 Annual Meeting of the American Political Science Association, San Francisco, Calif., Ag. 30-Sept. 2, 1990; and "Routinizing the AIDS Crisis: Issues in the Operation of AIDS Service Organizations in Upstate New York," Paper prepared for delivery at the 1992 Annual Meeting of the Urban Affairs Association, Cleveland, Ohio, April 29-May 2, 1992.

9. According to informants, part of the reason for the form the Institute initially took was a hesitancy about creating another permanent bureaucracy in the state government. Since the AIDS crisis was still in its infancy in 1983-84, there was no way to foresee how long the emergency would last. It was not until two years later that Institute employees originally hired on a temporary basis were made eligible for the full range of benefits available to other state government employees. From there, the Institute's budget and staff have grown enormously.

10. Unlike the other three localities, quarrels within the Syracuse CSP from the beginning (discussed below) made it impossible to achieve incorporation status and a settled set of by-laws until 1991. In the interim, funding took place through a complex pass-through arrangement with the Research Foundation of the State University of New York.

11. By 1992, each of the four CSPs was receiving between $400- 600,000 a year in state

monies, principally from the AIDS Institute (but also from other state agencies with whom they contracted to provide services like drug and alcohol counseling). Except for the Rochester CSP, state funding constituted the overwhelming financial base of the organizations. AIDS Rochester has been more successful than the others in raising large private contributions through major fund-raising events. The CSPs have also been increasingly successful in soliciting contributions through arrangements with local United Way organizations, though this channel constitutes only a small share of total revenues.

12. How well those functions are being performed (particularly case management and counseling) are matters of considerable local controversy. Client disatisfaction has contributed to the formation of alternative service and support organizations in at least three of the four CSP regions, as we shall indicate below.

13. The rationale for this was never explicitly spelled out, but it took various forms. Early in the history of the disease, the expectation was that PWAs would not live long enough to play a major role on the boards. Later, even as HIV infection was detected earlier and PWAs lived longer lives, it became difficult to overcome that view. As the organizations became more bureaucratic and professional, too, there was a stated concern that there might be a conflict of interest between serving on the board and being a client of the agency. These rationales also extended to PWAs serving as volunteers in the agencies. While there has been some loosening of these constraints, there is a continuing tendency to discourage PWAs from serving as "buddies" to other clients. (Interestingly enough, these kinds of limitations have been less apparent in ASOs in bigger cities like GMHC in New York City.

14. It is ironic that the Director of the AIDS Institute, Nicholas Rango, who has served in that position for five years, announced only in the summer of 1993 that he has been living with AIDS for at least the last three years.

15. A notable exception to this statement is the role played by State Assemblyman, Arthur Eve, Deputy Majority Leader of that body. Eve, who represents a Buffalo district, has been prominent in seeking funding for programs directed specifically to minority populations.

16. One might follow Jeane Kirkpatrick in distinguishing between "representativeness" and "representation." The former requires only similar distributions of personal characteristics in a representative body and a larger population. Representation, however, is described by Kirkpatrick as "an emergent characteristic, the outcome of the process that includes the choice of some persons to act as representatrives, their interactions and decisions, and their continuing relation to those represented." Jeane Kirkpatrick, The New Presidential Elite (New York: Russell Sage, 1976), p. 281, cited in John M. Bruce, John A. Clark and John H. Kessel, "Advocacy Politics in Presidential Parties," American Political Science Review, 85 (December 1991), p. 1090.

17. The four core metropolitan areas are predominantly Catholic in population (though there are large numbers of Protestants in the rural areas and small towns that dot the rest of the regions).

Catholic religious figures leaders --with a few notable exceptions -- have stayed aloof from involvement in AIDS issues. More liberal religious leaders especially from among Episcoplians and Presbyterians have not been particularly visible on the boards of the CSPs but they have been active in providing a variety of services to PWAs including housing, feeding programs and spiritual counseling. In some places, individual Catholic priests have been active in various ASOs. Thus, in Buffalo, a priest took the lead in creating Benedict House, a residence for men with advanced HIV infections; its board also contains a strong representation of persons with religious backgrounds, as well as persons with backgrounds in the social elite of the city. The AIDS Alliance of the Niagara Frontier, which is an organization created by and for PWAs, originally had considerable support from a prominent Episcopal laywoman and recently has selected a Catholic priest as its president. The latter has been active in the organization since its founding. Nuns and Catholic and Episcopal priests have also worked in various capacities in the CSPs, including as counselors and volunteers.

18. It is only recently, for example, that AIDS Rochester has come forward with a proposal for developing a needle exchange program in that city. See, Paula Silvestrone, "Needle Exchange," in Resources (Summer 1993), a quarterly publication of the organization.

19. In at least two of the regions, informants insisted that there was also a tendency to minimize the visibility of gay volunteers by not assigning them responsibility for educational presentations especially to certain (predominantly non-gay) groups.

20. One activist informant suggested the existence of an interesting dividing line between activist board members and professionals, particularly those employed by government agencies: the former were willing to attend meetings in the evening or at any time of day; the latter, he suggested, preferred meeting during the day when they could count their time away from work as part of their employment obligations.

21. For a provocative formulation of the the movement of ASOs from "grassroots" to "business suits," see Cindy Patton, "The AIDS Industry: Construction of 'Victims,' 'Volunteers,' and 'Experts,'" in Erica Carter and Simon Watney (eds.), Taking Liberties (London: Serpent's Tail, 1989), pp. 113-25. But, also see, Jan Zita Grover, "Constitutional Symptoms," in the same volume (pp. 147-59). Grover questions the "incontinent nostalgia" she associates with the work of Patton and others, who appear to dream of a kind of communitarian utopia within the gay and lesbian community that should find expression in the way ASOs are run.

22. One classic study that illustrates these problems is Philip Selznick, TVA and the Grassroots (Berkeley: University of California Press, 1949). Also see, Annmarie Hauck Walsh, The Public's Business (Cambridge, Mass.: MIT Press, 1978), esp. chs. 7 and 8, which deal with the operations of the boards of directors of a number of public benefit corporations and the role played by administrative leaders of those organizations -- those Hauck characterizes as "the mandarins"-- including Robert Moses and Austin J. Tobin of the Port of New York Authority.

23. One of the rare exceptions to this pattern of behavior was the appearance of Mayor Thomas Walsh of Albany in 1992-93 in safer sex public service announcements on television created by ACT UP/Albany. It is noteworthy that Mayor Walsh was then engaged in a struggle for influence in the Democratic party which involved efforts by the contending factions to reach out to the increasingly politically-active gay and lesbian community. Later in 1992, Mayor Walsh announced that he did not plan to run for re-election and he was appointed in 1993 to a court position by Governor Cuomo.

24. The recent mobilization of conservative forces in educational politics in supposedly liberal New York City and their measure of success in achieving some of their goals (including the firing of the administrative head of the city's school system) has probably contributed to the wariness of elected state officials and the Board of Regents in pressing any further on matters of safer sex education and plans (in New York City) for condom distribution in the schools.

25. The problems involved in holding national government bureaucracies accountable to legislative bodies or even to executives have been discussed in the literature of public administration for many years. For one recent treatment of the subject, see Dennis D. Riley, Controlling the Federal Bureaucracy (Philadelphia: Temple University Press, 1987), esp. chs. 2 and 3. If problems exist at the national level, as they do, they are likely to be just as great at the state level in states as large and diverse governmentally as New York State.

26. One of the complaints commonly heard among gays and lesbians in the upstate communities is that the kinds of materials produced by the AIDS Institute and the CSPs and the presentations given in the name of "education" have tended to ignore the special needs and circumstances of gays and lesbians for safer sex messages.

27. Although I have not stressed the point in this paper, it should be emphasized that the number of cases diagnosed in the upstate area covered in this study constitute less than five percent of the cases in the state as a whole. As of December 31, 1992, 83 percent of the state's more than 51,000 cases had been diagnosed in New York City since statistics on infection began to be collected. "Only" 13 percent of the cases were in the rest of the state with the majority of those being found in the three counties immediately adjacent to New York City: Nassau, Suffolk and Westchester. (The remaining 4 percent of the cases were among inmates in the state prisons.) It should be noted that the same pattern of distribution essentially holds for data gathered only for the calendar year 1992. Bureau of Communicable Disease Control, New York State Department of Health, AIDS Surveillance Quarterly Update: For Cases Reported Through December 1992, p. 11.

28. In recent years, conservatives in the legislature (including most members of the Republican party) have continued to support funding for the Institute, but at the same time have put forth an increasing number of proposals involving such matters as breaching patient confidentiality and controlling the behaviors of persons thought to be infected with HIV. Thus far, such measures have been narrowly defeated. Whether some of those proposals have been introduced with the expectation that they would never be passed is a matter for conjecture, but it is consistent with

the rather cynical style of politics in New York State.

29. In that connection, see David H. Rosenbloom, Public Administration (New York: McGraw-Hill, 1993), p. 174.

30. Public administration has traditionally focused on conflicting models of accountability which either stress forms of external control (like legislative oversight) or internal controls which flow from socialization to professional roles. In that connection, see Riley, op. cit., esp. pp. 4-7. Here I am suggesting a need to go one step further and to identify the way the varying forces in an organizational leader's environment are incorporated into the organization's way of doing things. Some of the theoretical issues touched on here might be cast in the terminology of principal-agent relations, but I have chosen not to address those issues in this paper.

31. While this point is fairly abstract, it is one of those issues that has haunted the analysis of interest group influence since at least the work of David B. Truman. See his, The Governmental Process (New York: Alfred A. Knopf, 1951). Thus, minorities, IVDUs, and women may be categories of intellectual concern for the CSPs -- and individuals from those categories are being provided with services -- but it is much less clear how the CSPs could or should be held accountable to those population segments if they are not politically mobilized. Failing their own mobilization, who legitimately speaks for these population groups?

32. We might for example, have included other population segments in this section like adolescents and hemophiliacs, but I have chosen not to do so.

33. Why this should be is difficult to determine. One informant suggested that the establishment of bureaucratic routines in ASOs is one way of coping with the painful experience of working with clients who are frequently dealing with issues of death and dying. Thus, it is a strategy for avoiding "burnout" on the part of agency staff, but the distancing behaviors involved may not contribute in a healthy fashion to providing the psychological and social support that the person infected with HIV so badly needs.

34. Here we need to be careful in distinguishing between the non- compliant yclient, who may be unable or unwilling to follow the direction given by agency support staff because of addictions or other self-destructive behavior patterns, and the dissident client, who decides for himself or herself that the counsel being given by the agency does not meet his or her physical or psychosocial needs. In real life, the line between the two is not so easy to draw. Some critics of the agencies argue that agency personnel are all too ready to dismiss complaints by clients as expressions of behavioral disorders or even AIDS-related dementia rather than recognizing the political and governance issues that need to be addressed by the agency.

35. That does not mean that they are not present. Several current members of CSP boards have long histories of gay and lesbian activism, but they do not promote gay and lesbian identity within the organizations nor have they played a prominent role in encouraging the CSPs to take a more visible role in issue advocacy. Some continue to be visible activists outside the CSPs;

others seem to have retired from community activism.

36. For one interpretation of African-American attitudes towards AIDS, see Harlon L. Dalton, "AIDS in Blackface," reprinted in Nancy F. McKenzie (ed.), The AIDS Reader (New York: Meridian Books, 1991), pp. 122-43. Unfortunately, the empirical grounding for a number of Dalton's arguments is unclear. Furthermore, the piece was originally published in 1989 and even by then organizations serving the minority community were beginning to overcome community resistance to discussing AIDS and organizing around it.

37. In only a few places outside of the major metropolitan areas did ASOs develop independent of the CSPs. One notable exception was the task force that emerged in Utica during the mid-1980s when the Syracuse CSP was going through administrative turmoil.

38. After several demonstrations at city high schools organized by ACT UP members, in the Spring of 1991 an interorganizational group of more "respectable" organizational participants was formed in Buffalo calling itself Community Action for Sex Education which began to pressure the Buffalo Board of Education to provide a comprehensive sexuality education program that included AIDS information. The CSP was a participant in this effort along with Planned Parenthood and some supporters of general reform in the Buffalo schools.

39. Here I have in mind such mechanisms as the state government's employee checkoff system which allows for greater flexibility to donors in the selection of organizations than some of the traditional United Way procedures. Arrangements have been made in such cases to allow persons to contribute to non-designated organizations so long as those organizations have filed proper evidence of not-for-profit status.

40. Membership in local ACT UP and PWA groups have not been quite the same in the four communities. While there is some overlap, ACT UP chapters have tended to attract some non-infected, younger people (often with college backgrounds) who see AIDS issues as vehicles for the expression of general dissatisfaction with the way American society makes decisions that affect the poor and the powerless. PWA organizations tend to be composed predominantly of infected persons and persons directly involved in dealing with their personal needs. with them. There is less of a generalized ideological underpinning to PWA groups, though they are quite prepared to become involved in agitating on service issues that directly affect their lives.

Beneficial Exchanges? Trade Wars and International Security

David M. Rowe
The Department of Political Science
The Ohio State University
August 28, 1993

Abstract

This paper uses trade wars as a vehicle for exploring the key conceptual and theoretical issues needed to understand international economic conflict and how it may impinge on broader issues such as security. Starting from the recognition that conflict is a fundamental characterstic of trade, this paper identifies three different types of trade wars. The first is the optimum tariff war which arises from disputes between importing and exporting states over the terms of trade. The second is the protective trade war which arises from disputes over the effects of trade on the locus of production. The third is the strategic trade war which arises from disputes between rival exporting states over the level of prices on the one hand, and the effects of trade (and government trade policy) on the locus of production on the other. Each type of trade war will involve a different underlying domestic coalition, which, in turn, will affect the dynamics of how the conflict evolves and its likelihood for spilling over into other areas and issues. The central role played by domestic coalitions in determining the trajectories of trade wars points research in this area toward two frontiers -- understanding how national preferences regarding security are formed and articulated across political systems; and integrating domestic and international levels of analyses.

Paper presented to the Annual Meetings of the American Political Science Association, Washington DC, September 2-5, 1993.

Wealth and power have always been two central objectives of state policy in the international system. Yet, these two objectives have often not been accorded equal importance by students of international relations. Trade and economic relations between states were often relegated to the realm of low politics, issues important to the state's economic welfare but not critical to the high politics of maintaining national security. This relative valuation is changing, however, as economic issues assume a more prominent place on the security agenda.

A number of factors account for the rise of economics as a security issue. First, the end of the Cold War enables states to consider more critically other issues -- such as international trade -- which were once considered secondary to the superpower conflict. It has also created a number of new state actors in the international economy whose role, and commitment to the liberal principles underlying the GATT, are uncertain. A second factor is Japan's remarkable success in creating a competitive high-technology economy and the aggressive export behavior of Japanese firms. Japan's economic success is popularly believed to have come at the expense of its trading partners, sparking a debate over what role governments can and should play in protecting their home industrial base from aggressive economic competitors. Finally, the threatened breakdown of the GATT-based open world economy into regional trading blocs means that countries may soon be operating in a far more hostile international economic environment.

The rise of economics as a security issue also signals that international economic relations are likely to become more conflictual in the future. On the one hand, this is simply an extrapolation of current world trends. Increasing levels of economic conflict are to be expected should the GATT-based system of free trade break down. Shifting interstate alliances brought on by the end of the Cold War may also increase the level of economic conflict by leading states to reduce the volume of trade in the international system. Worried that trade may strengthen potential rivals, states may limit trade with other powers as one tactic for enhancing their own security.[1] The shrinking levels

---

[1]Joanne Gowa and Edward D. Mansfield, "Power Politics and International Trade," American Political Science Review 87 (June 1993) pp. 408-420.

of trade that result, however, may well increase the potential that serious economic conflicts will erupt between states.

On the other hand, increasing levels of economic conflict may also arise from the greater importance being attached to economic relations. As states place a higher value on achieving favorable outcomes in their economic relations with other states, the potential for economic conflict between states increases. As a result, some have characterized the future international system as one dominated by trade wars between the world's major economic regions -- Europe, Asia and the Americas. In the Japanese version of the book The Japan That Can Say No, Shintaro Ishihara characterizes the twenty-first century as one in which economic warfare will replace military warfare as the dominant form of international conflict, and claims that Japan will be the winner of the twenty-first century's economic wars.[2]

Although increasing levels of international economic conflict seem fairly certain, there is little agreement about the broader implications of this development. Three different scenarios seem to be emerging -- one optimistic, one pessimistic and one neutral but with pessimistic overtones. The optimistic scenario sees little scope for international economic conflicts to develop which will also spill over into intense political conflicts. States continue to have an interest in open international markets, and even if the GATT does break down, the resulting trade blocs will closely reflect current patterns of trade. As a result, "Regional free trade agreements will do more economic good than harm; and the problems of the GATT are so deep-seated that it is unlikely that a world without regional free trade agreements would do much better."[3] The pessimistic view, which finds its theoretical roots in strategic trade theory, holds that coming international economic conflicts could easily degenerate into damaging mercantile rivalries as states seek to seize positions of competitive advantage through

---

[2]Shintaro Ishihara, The Japan That Can Say No: Why Japan Will Be First Among Equals (New York: Simon and Schuster, 1991) p. 50. Two further examples of works that identify international economic conflict as a likely feature of the coming world order are Lester C. Thurow, Head to Head: The Coming Economic Battle among Japan, Europe, and America (New York: William Morrow and Company, 1992); Jeffrey E. Garten, A Cold Peace: America, Japan, Germany, and the Struggle for Supremacy (New York: Basic Books, 1992).

[3]Paul Krugman, "Regional Blocs: the Good, the Bad and the Ugly," The International Economy, November/December 1991, p. 56.

aggressive unilateral trade and industrial policies.[4] Finally, the neutral view argues that whether economic conflict emerges as a serious problem in international politics depends upon the willingness of one or more dominant states to play a stabilizing role in the international system. This view, which is an extension of hegemonic stability theory, is pessimistic in so far as it foresees few states able or willing to take up this task.[5]

The disagreements between these views have several sources. One is the focus of analysis. The optimistic view focuses on each state's general interest in having an open world economy and hence maximizing world economic welfare. Because aggregate levels of trade will not fall much under a three bloc trading system, it sees little room for intense political conflict. The pessimistic view focuses its analysis not on the aggregate gains from trade, but rather on how they are distributed across states in the international economy. As states seek unilateral advantage in capturing the gains from trade, they may spark serious interstate conflicts. Moreover, by contributing to uneven growth between states, trade may also create disparities in power which then lead to interstate conflict. Finally, the neutral view focuses on the underlying configuration of power in the international system and whether a dominant power exists which can play the role of stabilizer.

Because each scenario focuses on different aspects of the international economy -- aggregate welfare, distribution of the gains from trade, stability of the international system -- each characterizes the problem posed by trade somewhat differently. In the optimistic view, trade remains the positive sum game of liberal international trade theory. By focusing on how states may capture gains from trade in ways that impose costs on others, the pessimistic view transforms the trade problem into a zero sum game in which states struggle for national advantage. Finally, by focusing on systemic stability, the neutral conception views the "trade" problem as that of providing a public good -- international stability -- from which all members of the international community benefit.

Clearly these three views are not incompatible -- but they are incomplete. Taken together they illustrate the considerable conceptual and theoretical ambiguities of dealing with trade and international economic conflict. Like the proverbial blind men and the elephant, each describes a different aspect of the

[5]See, for example, the remarks by Charles Kindleberger in The International Economy, Novembr/December, 1991.

problem, drawing different and sometimes contradictory conclusions, but the elusive whole remains to be seen. As a consequence, the broader implications of a world characterized by increasing levels of international economic conflict remain unclear.

One objective of this paper is to try to glimpse that elusive elephant. By exploring one form of intense interstate economic conflict -- trade wars -- this paper seeks to sharpen our focus on the key conceptual and theoretical issues needed to understand how it may impinge upon broader political issues such as international security. Moreover, in exploring the theoretical and conceptual ambiguities surrounding trade wars, this paper seeks a further objective: to map out a research agenda of the critical issues needed to understand the intersection of international economic conflict and international security.

UNDERSTANDING TRADE WARS

This paper defines trade wars as serious international economic conflicts in which

A) the conflict is between states and arises because the states hold conflicting economic objectives;
B) trade is the primary instrument these states use to pursue the conflict, either defensively by closing off the home market, offensively through aggressively subsidizing exports to deny foreign markets to other states, or through some combination of both;
C) the conflict is iterative and is characterized by some positive level of reciprocal threat.[6]

All three conditions are important for understanding trade wars. The first emphasizes that trade wars are interstate conflicts as opposed to conflicts between firms or other non-state actors in the international economy. Limiting trade wars to conflicts over economic objectives is important for two reasons. It brings the term "trade war" as defined here in line with common usage of the term, which usually refers to cycles of retaliatory tariff setting between two or more countries.

---

[6]This definition is similar that of John A.C. Conybeare in Trade Wars: The Theory and Practice of International Commercial Rivalry (New York: Columbia University Press, 1987). Conybeare (p. 3) defines trade wars as "a category of intense international conflict where states interact, bargain, and retaliate primarily over economic objectives directly related to the traded goods or service sectors of their economies, and where the means used are restrictions on the free flow of goods and services."

Moreover, because the objective of this paper is to understand better how international economic conflicts can affect broader issues such as state security, this paper must begin by examining conflicts which are economic in nature.

The second condition brings trade wars under Baldwin's rubric of economic statecraft by stressing that trade is the instrument states use to pursue the conflict.[7] Trade wars result when two or more states try to exert influence by manipulating the flow of goods and services between them. By treating trade wars as one possible outcome of the reciprocal use of economic statecraft, this definition enables us to link up the study of trade wars with other instances of economic statecraft -- embargoes, sanctions, and even free trade -- whose commonalities and differences should provide useful insights into not only how these phenomena relate to each other, but also to broader issues such as international security.

The third condition emphasizes that a trade war is a form of strategic interaction between states. Trade wars can arise only when states are interdependent; hence, not all instances where states manipulate trade -- such as non-discriminatory tariffs, optimum tariffs or trade embargoes -- are necessarily salvos in a trade war. Moreover, the conflict between the states must be iterated -- actions by one state must provoke a counter-response by the second. Without interaction, no trade "war" can exist. This definition of trade wars is quite broad, and includes conflicts such as the tit-for-tat trading disputes that often seem to arise between the EC and the United States, as well as more protracted economic conflicts, such as the breakdown of world trade in the 1930s through a series of "beggar-my-neighbor" tariffs.

It is important to note that this definition conceives of trade wars as existing along a continuum of international economic interaction, defined by free-trade at one pole and overtly hostile, political acts such as embargoes and economic sanctions at the other. Movement along the continuum from free trade toward interactions such as embargoes reflects increasing

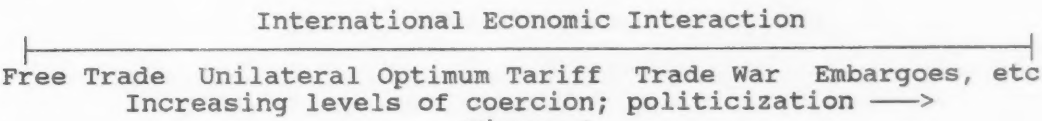

Figure 1

levels of coercion and politicization. For example, a unilateral optimum tariff is more coercive than free trade because a state

---

[7]David Baldwin, Economic Statecraft (Princeton: Princeton University Press, 1985).

which applies an optimum tariff uses the country's market power to extract wealth from its trading partners. Optimum tariffs which do not provoke a retaliatory response, in turn, are less likely to be politicized than trade wars which represent reciprocal conflicts between two or more states. Finally, the most hostile forms of international economic interaction are boycotts, embargoes and sanctions, where trade may actually break down. These actions not only involve the cessation of trade between countries, they also represent highly politicized conflicts in which one or more states seek to manipulate trade for explicitly political ends. Thus, Britain's economic sanctions against Rhodesia were intended to bring that country to majority rule; the COCOM embargo of strategic goods to Eastern Europe and the Soviet Union was designed to weaken the Warsaw Pact's military capabilities; the ongoing U.S. embargo of Cuba is meant to undermine the Castro regime.

Trade wars lie between the two extremes of free trade on the one hand, and hostile economic acts such as embargoes on the other. What is clear is that trade wars may involve greater or lesser levels of international conflict. The tit-for-tat Chicken and Rapeseed disputes between the United States and the EC were relatively minor conflicts that had little impact on the broader interplay of US-EC relations, while earlier trade wars such as the Anglo-Dutch and Anglo-French trade wars of the 17th and 18th centuries at times erupted into military warfare.[8] Thus, a central question to be addressed is what factors enable some trading disputes to remain limited, while others may snowball into problems involving vital national interests.

In fact, that countries may engage in trade wars is itself something of a puzzle. Trade is a mutually beneficial exercise in which each party exchanges goods that it holds for goods held by others that it values more. If either party perceived no "gain," the exchange would not take place and trade would not exist. Because trade is a mutually beneficial exchange, common sense and the theory of international trade suggest that trade wars should be rare, because by reducing trade, trade wars may make both countries worse off.

Yet trade wars do occur. The reason they do so is that like mutually beneficial exchange, conflict is also a fundamental characteristic of trade. Trade involves two different types of conflict, both of which can lead to trade wars. The first type of conflict inherent in trade is over price. Even when two parties agree to a mutually beneficial exchange, they may still have substantial disagreements over the terms of that exchange. The same is true of trade. Trade consists of buyers and sellers. Buyers will desire lower prices for the goods that they buy

---

[8]Conybeare, Trade Wars, pp. 129-159.

(imports), while sellers will desire higher prices for the goods that they sell (exports). This conflict between buyers and sellers is zero-sum: the gains buyers reap through lower prices translate directly into losses to the seller and vice versa. Moreover, this conflict is a fundamental feature of economic exchange, arising because the two actors (buyers and sellers) occupy opposite sides of the market.[9]

This inherent conflict between buyers and sellers over the terms of exchange provides the first clues into the origins of trade wars. First, when states have market power in world markets, they may attempt to shift the terms of trade in their favor. These attempts may be unilateral as in the case of optimum tariffs or export taxes. They may also result in international cartels such as OPEC and the International Coffee Agreement, in which the producing states of those commodities seek to raise prices by jointly controlling the supply reaching world markets. In either case, the objective of state policy is to use the country's power in world markets to raise the value of exports relative to imports. But by intervening to raise the value of their countries's exports on world markets, states also create the potential for trade wars. The gains they achieve translate directly into losses by the importing countries.

Conflicts over price may also induce other economic actors to turn to the state to reap gains that they would otherwise be unable to capture via their activity in the marketplace. Markets, even world markets, do not exist in a vacuum. Rather they are nested within legal and institutional structures which set the parameters of the market by vesting property rights and determining transaction costs. By turning to the state to alter the legal and institutional underpinnings of the market, economic actors may achieve outcomes that would be impossible by acting in the marketplace alone. For example, consumers may lobby the government to regulate monopolies or increase competition among producers, both of which would lower the prices they pay. Likewise, producers may seek state intervention to limit competition in markets, enabling them to raise prices to the consumer. Where these efforts engage the interest of foreign actors (either producers or consumers), the potential for trade wars emerges.

The second conflict inherent in trade concerns the effects of trade on the locus of production. Trade forces factors of production to move out of those sectors in which the country is

---

[9]Interestingly, conflicts over price are obscured when markets are perfectly competitive, because neither party can secure prices that deviate from those obtaining in the marketplace. In this instance, both buyers and sellers act as price-takers.

uncompetitive at world prices and into those sectors where it has a comparative advantage. This can be a highly disruptive process, leaving some owners of factors of production (capital, land, labor) permanently impoverished even though the country as a whole benefits. This creates an inherent conflict of interest between the "losers" from trade and three other sets of actors: foreign producers who are their direct competitors; domestic consumers who enjoy lower prices brought by trade; and domestic producers in the export market who desire open markets for their exports.

The effects of trade on the locus of production may generate the potential for trade wars in two ways. First, the state may become directly concerned should trade threaten to make the country's strategic industries uncompetitive. This could, in turn, prompt the state to undertake protectionist policies which may impose costs on foreign actors. Second, the domestic "losers" from trade may demand that the state raise barriers against the imports which are harming their industries. To the extent that the state's efforts to protect its domestic producers impose costs on foreign actors, the potential for trade wars emerges.

Thus, conflict is an inherent feature of trade. Trade creates conflicts between states over the terms of trade, between foreign and domestic producers who compete the same market, and internally between both domestic import competing producers and consumers on the one hand, and import competing and exporting producers on the other. Recognizing the conflictual aspects of trade is important, for it is these which create the potential for trade wars between states to arise. They also give rise to three different types of trade war, as well as create considerable ambiguity when trying to examine the wider implications of trade wars for international relations.

Three types of trade wars

The first type of trade war involves conflicts over the terms of trade between two or more countries. This trade war, the "optimum tariff war," arises when one country seeks to shift the terms of trade to its advantage by applying an optimum tariff or export tax, thereby provoking a retaliatory response from its trading partners.

International trade theory has long recognized that when countries are "large" (i.e. they possess market power), they may extract wealth from their trading partners by restricting trade. The mechanics of this process are straightforward. Figure two

represents a large country's market for imports.[10] Demand for imports is given by the schedule DD; the supply of imports from world markets is given by SS. At free trade, the country imports Q_1 of the good at price P_w. Because this country faces an upward sloping supply curve, it may improve its terms of trade by applying a tariff on its import. The tariff raises the domestic price of the imports to P_t, causing the quantity of imports to fall to Q_2. The drop in imports is perceived by foreign exporters as a fall in demand, which causes world prices to fall to P_w'. The difference between the domestic price of imports P_t and their world price P_w' is the tariff levied by the government.

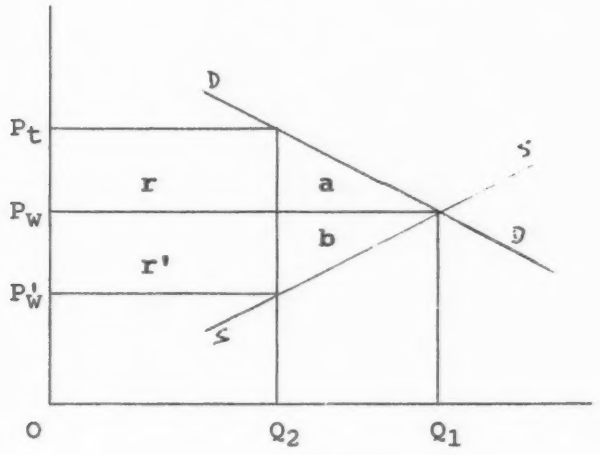

Figure 2

Several important effects follow. The tariff imposes deadweight welfare costs represented here by the triangles **a** and **b**, which are the deadweight welfare costs of the tariff to the domestic economy and to foreign producers respectively. The tariff also creates a transfer of wealth to the government imposing the levy. The rectangle **r** represents the tariff revenue that the government captures from domestic consumers of the imported good, while **r'** is the amount the government extracts from foreign exporters. This transfer to the government will, in the absence of foreign retaliation, result in a net gain for the economy so long as **r'**, the wealth captured from foreign exporters, exceeds **a**, the deadweight costs of the tariff on the

---

[10]The following argument is presented in terms of a tariff on the country's imported good. Tariffs and export taxes are symmetrical in terms of their welfare effects, so the argument also applies to taxes on the target countries exports. Tariffs and export taxes may be significantly different, however, in terms of their political consequences, as they will fall on different domestic groups.

domestic economy. Moreover, it is important to note that states may capture foreign wealth by restricting trade only in cases where the country is large -- i.e., faces an upward sloping supply schedule for imports. As the supply curve flattens out and becomes more elastic, the ability of the government to extract wealth from foreigners drops until, in the limit, the supply schedule becomes flat. At this point, the country becomes a price taker ("small") on world markets and any attempt by its government to manipulate the terms of trade through restricting imports will only impose costs on the domestic economy.

So far this paper has considered the optimum tariff only from the perspective of the country imposing it. How that country's trading partners respond to the optimum tariff is critical in whether a trade war emerges, and depends largely on whether the trading partners are price takers on world markets. In cases where the trading partners small, retaliation will be less likely to occur.[11] Any efforts by the small country government to manipulate the terms of trade will only impose costs on the domestic economy.[12] If the country is large, however, retaliation is more likely. A large government facing an optimum tariff may negate its effects by applying its own optimum tariff against the first country's exports. In most cases, the net result is lower levels of trade and economic welfare in both countries, making them worse off economically. In some cases, however, it will not. Thus, Harry Johnson in a seminal article on optimum tariffs has demonstrated that a country may benefit from an optimum tariff -- even with retaliation -- in instances where the retaliating country's trade is highly inelastic.[13]

The optimum tariff trade war is the most studied form of trade war. John A.C. Conybeare used the optimum tariff war as the basis for his study of the subject, finding that the payoff structure to large countries involved in optimum tariff disputes approximated that of a prisoner's dilemma. This created a

---

[11]Conybeare, pp. 44-45. Even when the country is small, retaliation may occur, although it is analogous to shooting oneself in the foot. Conybeare resolves this puzzle by pointing to reputation effects -- small countries may choose to retaliate to build reputations. Trade Wars, pp. 270-271.

[12]This statement is not entirely correct. A small country may still retaliate in order to impose costs on the initiating country's firms and hence political costs on that country, even if it cannot shift the terms of trade back in its favor. See below, pp. 13-14.

[13]H. G. Johnson, "Optimum Tariffs and Retaliation," The Review of Economic Studies 21 (1954) pp. 142-153.

predictable pattern of interaction which closely followed that of tit-for-tat. One country's optimum tariffs prompted retaliatory tariffs from its partners, resulting in welfare losses to both sides, which, eventually, lead them on the path back to free trade by lowering tariffs.[14]

But disputes over the terms of trade are not the only source of trade wars. Trade wars may also arise because countries disagree over the effects of trade. Trade can be a powerful force, dramatically altering a country's productive structure as well as disrupting relations among its major social groups.[15] Disagreements between states over the internal effects of trade may develop into the second type of trade war, which I term the "protective trade war." A protective trade war emerges when one country seeks to protect domestic industries by raising barriers to trade, and in so doing prompts a retaliatory response from its trading partners.

Protective trade wars differ from optimum tariff wars in a number of important respects. First, the two wars differ in terms of the underlying source of conflict. In the optimum tariff war, the source of conflict is the terms of trade. Both parties agree to the exchange but not to the terms on which it takes place. Thus, each seeks to restrict trade in an attempt to shift the terms of exchange in its favor. In the protective trade war, however, it is not the terms of trade which are at issue, but rather trade itself. The demand for protection arises not because the main parties to the exchange -- importers and exporters -- disagree about the terms of trade, but rather because the exchange itself has deleterious consequences for a third party -- import competing producers. For these producers, trade drives down prices on the goods they produce and hence their incomes. As a result, they may turn to the state to enact tariffs to raise the price of imports entering their market. Thus, even though the optimum tariff war and protective trade war may be pursued using the same policy instrument -- tariffs -- the two are fundamentally different. The state's objective in an optimum tariff war is to lower the price of the country's imports relative to its exports; in the protective trade war, the state's objective is the opposite -- to <u>raise</u> the price of imports entering the economy.

---

[14]Conybeare, <u>Trade Wars</u>, pp. 266-269.

[15]See for example, Ronald Rogowski, <u>Commerce and Coalitions: How Trade Affects Domestic Political Alignments</u> (Princeton: Princeton University Press, 1989) and Jeffrey A. Frieden, <u>Debt, Development, and Democracy: Modern Political Economy and Latin America, 1969-1985</u> (Princeton: Princeton University Press, 1991).

This discussion suggests, moreover, that state policy in optimum tariff and protective trade wars will be supported by two different types of domestic political coalitions. For a country engaged in an optimum tariff war, the underlying domestic coalition will be principally between exporting and state interests. Exporters gain from the tariff because it raises the relative price of their good on world markets, while the state benefits both because it supplies a demanded policy and because it captures tariff revenues from both domestic consumers of the imported good as well as foreign exporters. Conversely, the underlying political coalition of a country engaged in a protective trade war will be principally between domestic import competing interests who demand a protected home market, and the state which reaps the benefits of supplying a wanted policy response as well as the tariff revenues generated by the trade barrier.

These differences will have important consequences for the dynamics of how each type of trade war is pursued. On the one hand, states involved in optimum tariff wars are likely to be more flexible, and more responsive to retaliation, than states engaged in protective trade wars. Foreign retaliation against a state levying an optimum tariff (provided the retaliating country is large) imposes costs directly on the two constituencies likely to support a strategy of optimum tariffs -- domestic exporters seeking to raise prices on world markets and the home state. Domestic exporters lose because retaliation shifts the terms of trade back in the retaliating country's favor, while the state suffers both because its policy of raising the relative price of exports backfires and because it loses tariff revenues captured from foreign exporters of the imported good. Moreover, the policy path for these actors is relatively straightforward -- to improve access to foreign markets by reducing trade barriers. This supports Conybeare's conclusion that optimum tariff wars are likely to result in a tit-for-tat pattern of interaction which eventually leads the parties back to free trade.

States pursuing protective trade wars, on the other hand, are likely to be less flexible in the face of retaliation than those engaged in an optimum tariff war. The import-competing producers who provide the primary impetus for the "protective" state's initial tariffs will be largely immune from any retaliatory tariffs levied by that country's trading partners. These tariffs will fall instead upon the initiating country's exporting interests and will only bolster the protective walls around the initiating country's economy.

Because retaliatory tariffs will not fall on the main beneficiary of the initial tariffs -- import competing industry -- they will only be effective if they can pressure the initiating state severely enough through other channels to compel it to overturn the original decision to supply tariffs to import

competing industry. Not only may these levels of economic pressure be harder to achieve than in the case of optimum tariff wars, but any attempt by the initiating state to reverse its decision will likely be opposed strongly by the initiating country's protectionist lobby. As a result, the most likely outcome of the protective trade war seems to be one of deadlock -- in which both countries maintain high barriers to trade even though these barriers make them worse off economically.

Moreover, the potential for the conflict to spread to other markets and issue areas seems greater in cases of protective trade wars than in optimum tariff wars. Because the retaliating country cannot impose costs directly on the main beneficiary of the initial tariffs, it must impose costs on other actors in the initiating country's political economy -- its exporters. How the initiating state responds to these actions cannot be predicted in the abstract, but it is entirely plausible that the initiating state may choose to escalate the conflict with counter-retaliatory tariffs, particularly if it cannot address the initial cause of the grievance -- its protective tariffs -- because of the strength of the domestic import-competing lobby. In instances of protective trade wars, then, there is a very real danger that the conflict will degenerate into a vicious and expanding cycle of "tat-for-tit" as each successive move imposes costs on actors not party to the initial conflict.[16]

Finally, optimum tariff wars and protective trade wars differ in that protective trade wars may emerge among countries which are both large and small on world markets. In the case of a large country, the mechanism by which the conflict is generated is straightforward and identical to that of the optimum tariff war. The initiating country's tariff drives down prices on world markets and generates a transfer of income from foreign sellers of the good to the tariff-imposing country. The drop in world prices, in turn, may prompt foreign governments to retaliate with tariffs of their own in an attempt to shift the terms of trade back in their favor.

However, a trade war may also emerge even when the initiating country is small on world markets and its actions do not affect the general level of world prices. The mechanism by which the conflict is generated is not, in this instance, the

---

[16]To see the dynamics of this point, imagine a feud between two families in which each instance of conflict is matched by retaliation against a family member not already in the fight -- "you hit me, therefore I will hit your brother; you hit my brother, therefore I will hit your sister." It is easy to conceive that a conflict pursued in this matter can quickly become irresolvable.

movement in world prices, but rather the costs imposed by the tariff on the individual exporters to the initiating country's market. Although the drop in demand created by the tariff may be too small relative to world markets to affect the level of world prices, it may nonetheless loom large in the calculations of the foreign firms serving that country. Theoretically, these firms could shift output to other markets and suffer no losses from the tariff, but this occurs only if markets operate in a frictionless manner. More realistically, the firms will suffer a period of falling demand (and incomes) as well as the search costs associated with finding new markets for their output. It is even possible that the initiating country's market will be critical enough to some firms or that the costs to these firms of finding new markets will be so high, that the initial tariff may threaten their continued viability. Where these firms are concentrated in a single nationality (or carry sufficient weight inside their country's politics) the political demand for retaliation may be generated, even though the aggregate effect of the initiating country's tariff on world prices is negligible. Unlike optimum tariff wars which are the domain of large countries, protective trade wars can engulf the small as well.

The third type of trade war, which I term the "strategic trade war," finds its theoretical roots in the idea that world markets are often imperfect -- characterized by small numbers of oligopolistic firms, high barriers to entry, economies of scale, and the existence of excess profits or rents which are not bid away by competition. Moreover, many of the goods in these markets not only comprise the cutting edge of high technology but their very production generates positive externalities for the economies in which they are produced. For example, the research and development (R&D) necessary to compete in these markets may increase productivity in other sectors by raising the country's general level of knowledge. As a result, states may be able both to capture excess rents for home country firms as well as ensure higher long-term economic growth through trade and industrial policies designed to guarantee a national presence in these markets.[17] A strategic trade war would arise whenever one state's policies to promote or protect its "strategic" industries elicits a retaliatory response from its partners.

[17]Michael Borrus and John Zysman, "Industrial Competitiveness and American National Security," The Highest Stakes: The Economic Foundations of the Next Security System, Wayne Sandholtz, et al. (New York: Oxford University Press, 1992) pp. 49-50. See also, Paul R. Krugman, ed., Strategic Trade Policy and the New International Economics (Cambridge, Mass.: The MIT Press, 1986). A recent statement is Laura Tyson, Who's Bashing Whom? Trade Conflict in High Technology Industries (Washington, DC: Institute for International Economics, 1992).

Strategic trade wars are important in several respects. First, the strategic trade war combines elements of both the optimum tariff and protective trade war. On the one hand, the strategic trade war, like the optimum tariff war, is a conflict over price. However, unlike the optimum tariff war, which is a conflict between producer and consumer, the strategic trade war is a conflict between producers. It is driven by fears that foreign government policies will enable foreign competitors to undercut the prices of home country firms. This not only diverts the sector's excess profits abroad, it imposes costs directly on the home country's firms in the form of lower profits. On the other hand, the strategic trade war, like the protective trade war, is also a conflict over the effects of trade on the locus of production. It is driven both by the desire of home country firms to shield themselves from competitive pressures, as well as the state's desire to preserve the country's industrial base in markets perceived to be vital to the country's long-term economic growth or perhaps even military security.

Another important aspect of the strategic trade war is that the economic actors involved will be large firms. Almost by definition, oligopoly firms operating in world markets must be large entities with global reach. The size of these firms will be an important variable in how strategic trade wars are pursued, because in politics, size matters. Large firms not only face fewer resource and organizational constraints than small firms in pursuing political strategies, but their very size and influence in the national economy makes them loom large in the calculations of politicians. As a consequence, the political choices of state actors may be more constrained in instances of strategic trade wars than in either optimum tariff or protective trade wars.

Finally, strategic trade wars may emerge from disputes over a broad range of issues, involving not only the traditional aspects of trade policy such as tariff levels, but also issues which were once considered the purview of a country's domestic politics such as the structure of its R&D subsidies or the nature of its anti-trust and industrial policies. Any foreign government policy which confers a perceived advantage on rival foreign firms can be fodder for a strategic trade wars. This not only stretches the boundary of what are issues of international politics, but it means that resolving strategic trade wars may be particularly problematic, as it will involve issues -- such as the nature of government-business relations -- which may be considered by the states involved to be purely domestic affairs.[18]

---

[18]A colleague of mine long involved in US security policy once remarked to me how eerily similar an agreement between the US and the EC over the level of subsidies to the American and

One implication of these points is that strategic trade wars are likely to be acrimonious. Not only do they involve conflicts over the distribution of resources in the international economy, but they will tend to be highly politicized. Strategic trade wars occur at the intersection of two vital state interests: creating or maintaining a high technology base and promoting the long term economic development of the country. Moreover, the critical nature of the sectors involved in strategic trade disputes creates a compelling political logic in favor of "managed trade" arrangements in which states attempt to preserve market positions of home country firms through market sharing agreements with other states.[19] Politically managed trade will often be demanded by firms in these sectors as a way of easing competitive pressures. Moreover, states may often oblige these demands because they will be unwilling to cede to the whims of the world market (and unscrupulous foreign governments) the perceived critical role that these oligopoly industries can play in promoting national wealth and power.

TRADE WARS, SECURITY, AND INTERNATIONAL RELATIONS

In this paper, I have identified three types of trade war, each of which originates in a different aspect of international economic conflict. Optimum trade wars emerge between producers and consumers through conflicts over price; protective trade wars emerge between states through disagreements over the effects of trade on the locus of production; strategic trade wars emerge both from conflicts between rival producers over the level of prices and from state concerns about the effects of foreign government policies on the locus of production. Moreover, each type of trade war engaged different coalitions of state and private actors. The underlying domestic coalition in a state pursuing an optimum tariff war was between exporting and state interests; in the protective trade war between import-competing and state interests; in the strategic trade war between large oligopoly firms operating in world markets and the home state. Understanding how these private and state actors interact is critical to understanding trade wars. Different actors bring different sets of policy preferences to the table. This not only has implications for the dynamic manner in which trade wars

---

European airliner industries was to the complex and minutely detailed arms control agreements which covered conventional forces in central Europe, including the provisions for verification measures.

[19]I will not consider her whether a managed trade solution is stable (I think in many instances, it is not) or whether the managed trade solution is desirable (I believe it will stifle innovation and lower long term growth).

unfold, it also determines the likelihood of whether trade wars may then spread to encompass other areas and issues.

The role that underlying domestic coalitions may play in determining the dynamics of a trade war underscores another important point. Instruments matter. The instruments a state uses in pursuing its international economic interests can play an important role in whether trading conflicts emerge between states as well as how they may evolve. Different types of economic instruments, even ones which have equivalent "protective" effects on the home economy, will engage the interests of foreign actors in different ways. Consider, for example, the differences between tariffs and voluntary export agreements (VERs). Although both will raise the same protective barrier around the home country's economy, they will have strikingly different political implications. Tariffs, which impose costs directly on foreign exporters, are much more likely to spark political conflict than are VERs. By requiring that foreign exporters act as a cartel to "voluntarily" restrict the amount of exports flowing into the economy, VERs enable foreign exporters to raise prices and increase profit margins. As a result, VERs benefit two powerful sets of interests in both countries -- domestic producers who gain the protective benefit of reduced import competition, and foreign exporters who now reap higher prices and profit margins inside the protected economy. Moreover, by benefitting powerful interests in both countries, VERs lessen the likelihood that trade conflicts in this market will emerge.[20] Thus, the specific means by which states pursue a trade war may be as important to the final outcome as the range of issues over which the trade war is waged.

Moreover, the pivotal role played by underlying domestic coalitions in determining the dynamics of international economic conflict highlights that there exists a crucial difference between economic security and more traditional formulations of national security which focus on maintaining the independence and territorial integrity of the state. In more traditional formulations, the central actors in international conflicts tend to be organs of the state itself -- its military, intelligence and diplomatic establishments. These actors are hierarchically tied to central decision-makers, allowing the state to articulate a reasonably well defined set of interests, as well as to formulate coherent policies for achieving them. In international economic conflict, however, the relationship of the state to the actors most directly involved in the conflict (exporters,

---

[20]This still does not make VERs a good policy, as they still muffle price signals to producers and raise costs to consumers. Moreover, they also enable foreign exporters to extract wealth from the home economy that could have otherwise been put to more productive uses.

importers, import-competing interests) is fundamentally different. These actors are generally not tied hierarchically to the state's central decision makers (with some exceptions), but are private interests whose relationship to the state can vary considerably across political systems.

This difference has both practical and theoretical consequences. Practically, this means that the character of state policy will differ fundamentally depending on whether the issue at hand involves economic or more traditional conceptions of security. In more traditional security realms, the state will be able to pursue its interests by means of directive -- commanding the various organs of the state apparatus to implement those policies which best achieve its goals. In the economic realm, however, the autonomy of private economic actors from central decision makers means that policy by directive will be the exception rather than the rule. Here, the problem confronting the state is to develop policies which generate the incentives for private economic actors to implement state goals while simultaneously acting in their narrow self interests. Yet, devising policies which create a convergence between the security interests of the state and the narrower interests of the country's private economic actors is a difficult task. As a result, the state will be less likely to articulate a consistent set of economic security interests, while its policies for achieving these interests will be less coherent than its policies aimed at more traditional security goals.

Theoretically, the differing structure of intra-state relations in economic as opposed to more traditional areas of security points the study of international economic conflict toward two research frontiers. The first is to understand how national preferences regarding security are formed and articulated across countries and political systems. Economic security is an ambiguous concept. Unlike more traditional conceptions of security such as territorial integrity, which can be plausibly advanced as truly "national" interests which benefit all members of the community, no such "national" formulation for economic security can exist. Different definitions of economic security will connote different distributions of economic resources and property rights inside domestic society, with different sets of winners and losers. How a state defines and articulates its economic security interests will result not only from the external imperatives of operating in an international system defined by anarchy, but equally from an internal political choice about the domestic distribution of wealth.

This leads directly to the second research frontier, which is to disassemble the increasingly artificial barriers separating the domestic and international levels of analysis -- as neither level by itself can provide a sufficient explanation for the politics of international economic conflict. Only by integrating

across the divide can we arrive at robust explanations for the behavior of actors -- both state and non-state -- in the international economy. Changing international circumstances are causing states to consider as security issues problems once relegated to the realm of domestic politics. Understanding these new issues and how they relate to broader concepts of state security requires the fruitful collaboration between specialists in both comparative politics and international relations.

CONCLUSION

In this paper, I have sought two objectives. The first was to use the study of trade wars as a vehicle for glimpsing the elephant of international economic conflict. The second was to map out a research agenda of the critical issues needed to understand the intersection of international economic conflict and international security. Although this paper has offered no unifying vision of international economic conflict, it has added a second layer of complexity to our understanding of international economic conflict. The three scenarios for the future of the world economy outlined in the introduction to this paper all concentrated on the role that states played in pursuing or ameliorating international economic conflict. This paper has argued, however, that understanding the behavior of states in this arena, also requires understanding how the state and private economic actors interact. For ultimately, it will be the interaction of these two sets of interests which will determine which vision of the future will come to pass.

The Domestic Political Economy of International Economic Sanctions

David M. Rowe

Department of Political Science
The Ohio State University
Columbus, OH 43210

To be presented at the 1993 annual meeting of the American Political Science Association, Washington, DC September 2-5, 1993. The Domestic Political Economy
of International Economic Sanctions

Abstract

In this paper, I use a simple partial equilibrium model of sanctions to derive several propositions concerning the political impact of economic sanctions on the sanctioned country. Most important, I show how economic sanctions may lead the target government to intervene extensively in the country's traded markets by creating new economic institutions for organizing trade. These new institutions will play both economic and political roles. Economically, they enable the government to minimize the costs of sanctions to the target economy. Politically, they become a valuable resource for maintaining domestic political support at a time of concerted international and economic pressure. Finally, this model accounts for many of the stylized facts that one can distill from the sanctions literature; in particular, the observation that using sanctions to compel desirable changes in the target country's behavior rarely seems to work.

The Domestic Political Economy of International Economic Sanctions

The analysis of traded markets must be the starting point for any study of the political economy of economic sanctions. It is these markets which link the target country's economy to world markets, and it is through them that the economic effects of sanctions are transmitted. Understanding how economic sanctions may influence political behavior in the target country thus requires understanding how sanctions may alter a target country's traded markets, and how these changes may affect the political and economic incentives of actors inside the target country.

In this paper, I use economic trade theory to create a simple partial equilibrium model for analyzing this problem. In particular, I use this model to explore how sanctions can lead the target government to intervene in the country's economy to create new economic institutions for managing trade, and how the government may then exploit these new institutions to influence the subsequent course of the country's domestic politics.

The reach of this paper, however, extends beyond contributing to a better understanding of sanctions to also exploring the political economy of trade. Both fields of inquiry share a common goal -- to discern how trade (or trade disruptions) can affect a country's political behavior. Yet

despite the closeness of their subject matter, there is surprisingly little contact between the two.[1] By using concepts from the political economy of trade to structure my analysis of sanctions, I attempt to bridge the gap between the two fields. Thus, this paper is both a theory building exercise in which I seek to understand the political and economic dynamics of economic sanctions, as well as a theory "linking" exercise, in which I use the study of sanctions to deepen our understanding of the political economy of trade.

The Political Economy of Economic Sanctions - A Basic Model

Figure 1 is a back-to-back partial equilibrium model depicting the effects of a sanction on the target country's imported good. The right-hand panel represents the domestic market for the imported good. **dd** is the country's domestic demand schedule, relating the price of the good to the quantity demanded. As prices fall, demand for the good rises; hence this curve slopes downward to the right. **ss** is the country's domestic supply schedule, relating the price of the good to the amount supplied by domestic producers. As prices rise, domestic

---

[1]The most notable exception is the work of Kaempfer and Lowenberg, who explore economic sanctions from a public choice perspective. See, for example, W. H. Kaempfer and A. D. Lowenberg, "Determinants of the Economic and Political Effects of Trade Sanctions," The South African Journal of Economics 56 (December 1988) pp. 270-277.

producers supply more of the good to the market; hence this

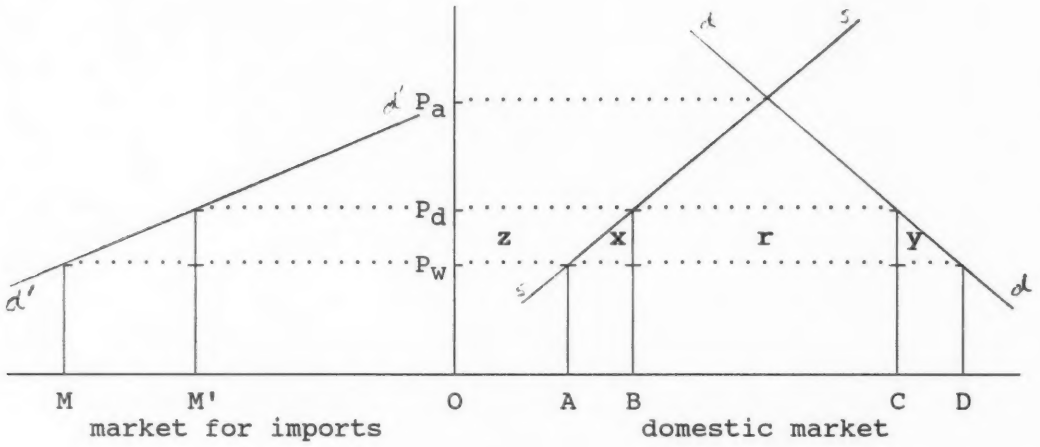

Figure 1

schedule slopes upward to the right. At free trade, domestic prices equal the world price P_w. Reading from the two schedules shows that at the price level Pw, the country produces OA of the good while consuming OD. AD, the difference between the quantity supplied by domestic producers and that demanded by domestic consumers, represents the quantity of imports from world markets.

The left panel of the diagram represents the target country's market for imports. **d'd'** is the country's import demand schedule. This curve relates price of the imported good to the quantity of imports demanded by tracing out at different price levels the difference between the country's domestic demand and supply schedules given in the right hand panel. At P_a, the autarky price, imports will be zero because domestic

demand equals domestic supply. As the price drops below autarky levels, domestic demand exceeds domestic supply and the quantity of imports rises; hence, the import demand (**d'd'**) curve slopes downward to the left.[2] World supply is given by the price line P_w, because this model depicts the small country case in which the changes in the country's demand for imports do not affect world prices. At the free trade price P_w, the country imports OM of the good which also equals AD in the right hand panel.

Now suppose the country is sanctioned by some of its trading partners who embargo OM-OM' of their exports to it. Turning first to the left-hand panel, these sanctions reduce the target country's imports from OM to OM'. This sanctions-induced shortage of imports drives their price upward to P_d.[3]

The right-hand panel allows one to trace out the effects of the sanction on the target country's domestic market. The

---

[2]Because this is a back-to-back diagram, the slope of the import demand curve is reversed.

[3] Essentially, this model assumes that the sanctions change the shape of the foreign supply curve rather than shifting it -- the supply curve is horizontal to M', at which point it becomes vertical. This model depicts sanctions in this manner because not all suppliers participate in the sanctions. Those suppliers from countries participating in the sanctions will be unable to supply the market regardless of price, while those suppliers from countries not participating will still be willing to trade at price Pw. Hence, the supply curve is horizontal over the range of non-participating suppliers and turns vertical at M'.

higher price of the sanctioned good stimulates domestic production to rise from OA to OB and causes consumption of the good to fall from OD to OC. This results in deadweight welfare losses to the target country, shown here by triangles **x** and **y**. Triangle **x** represents the opportunity cost of securing output AB from domestic producers rather than trade, while triangle **y** represents forgone consumption of the good at free trade prices. The sanction also redistributes wealth within the country. The area **z** represents a transfer from domestic consumers to domestic import-competing producers who now enjoy higher prices for their product. Finally, the sanction creates an area **r**, the sanctions rent, which represents the difference between domestic and world prices for the sanctioned good multiplied by the quantity of imports. The question of who captures this rent is not clear cut and will be considered below.

What insights can be generated from this model? My analysis will be based on several simple assumptions about the actors and the sanctioned market. I first assume that exporters seek higher prices for the goods they sell; importers seek lower prices for the goods they buy; and that the target government seeks to minimize the overall welfare losses of any sanctions to the economy. Second, I assume that markets are competitive; that they are initially free of government intervention; and that there will be no subsequent entry into

the sanctioned market by "sanctions busters" which dissipates any rents created by the sanction.[4]

Given these assumptions, I can derive several important propositions concerning the impact of sanctions on the target country's domestic political behavior. First, a sanction which raises the domestic price of the sanctioned import will cause the target government to intervene extensively in the market to organize trade in that sector. Second, sanctions may create domestic constituencies in the target country which have an interest in seeing the sanctions maintained. Third, the economic costs inflicted on the target economy will vary not only according to the elasticities of supply and demand for the sanctioned good, but also according to the structure of the market within which it is traded. Finally, the relationship between "sanctions busters" and the target government will be conflictual, despite the sanctions buster's role in continuing to trade with the target country.

The remainder of this paper explores these propositions under three variants of its model. In the first instance, it considers the case where the sanctions are applied against a "small" country's imports. This is the basic model presented above. The second case examined by this paper is that where the sanctions are applied against a "large" country's exports.

---

[4]This last assumption will be relaxed below.

Although it seems illogical that countries should apply sanctions against the source of a substantial portion of their imports, historically there are a number of instances when this, in fact, happened. The boycotts of Libyan and Iraqi oil, as well as the British boycott of Rhodesian tobacco, are all cases in point. Finally, this paper constructs a rudimentary "dynamic" model of sanctions which relaxes the assumption that the sanctions rent will not encourage new entrants into the market.

CASE 1: Sanctions on a small country's imports

Returning to Figure 1, the initial effect of the sanction is to restrict the imported supply of the good from OM to OM' in the left-hand panel, and from AD to BC in the right-hand panel. Domestic importers competing for this restricted supply will bid up the price offered to foreign exporters of the good to the level P_d. Foreign exporters receiving P_d thus capture a rent equal to the difference between the competitive world price of the good and its domestic sanctions price $[P_d-P_w]$ multiplied by the amount of imports OM' or BC. In essence, the sanction transfers wealth from domestic (target) importers of the sanctioned good to foreign exporters. Thus, a competitive domestic market for the imported sanctioned good generates welfare losses which not only include losses of producer and consumer surplus, but also the loss of sanctions rents.

How does the target government, seeking to minimize the costs of the sanction, respond to these losses? First, the welfare losses from the sanctions arise from two sources. On the one hand, the deadweight welfare losses (triangles **x**, **y**) result directly from the ability of the sanctioning governments to restrict the target country's imports. Outside of convincing the sanctioning governments to lift the sanctions, there is little the target government can do to minimize these losses to its economy.

On the other hand, the lost rent is caused not by the sanctions themselves, but by the structure of the market for the sanctioned good. Because it is a competitive market, domestic importers bid against each other for the restricted supply of the sanctioned good. This raises the price offered to the foreign exporter to P_d, and generates a transfer of wealth from domestic importers to foreign exporters.

A target government seeking to minimize economic losses must impede this transfer. It can do so by restructuring the domestic market as a monopsony. In essence, the target government can consolidate all buying activity into a single unit which intervenes between domestic importers and foreign exporters of the sanctioned good. This government "marketing agent" first buys from foreign exporters on world markets and then distributes the good among domestic importers. Because

the government now operates in the sanctioned market as a monopsonist, it can bid the exporters down closer to their reserve price, P_w.

How close the government comes to procuring the world price depends upon the specific structure of the international market for the sanctioned good. If the target government faces foreign exporters who compete against one another, border prices (prices paid to foreign exporters) for the good should approach world prices. If the foreign exporters collude, border prices will settle at an intermediate position between world prices P_w and the market clearing domestic price P_d, with the exact level determined by the relative bargaining strengths of each side. In either case, the target government is better off than if it had not intervened in the sanctioned market.[5] By acting as a monopsonist, it recaptures at least some revenues that initially went to foreign firms as rents from operating in a sanctions-distorted market.

But, restructuring the sanctioned market as a monopsony also has a political dimension. On the one hand, the government is likely to meet little domestic resistance to its extension of state control over trade. Because the rents it seeks to capture are currently flowing abroad, the government's efforts to manage trade impose few costs on domestic actors.

---

[5]Assuming, of course, that intervention is costless.

Moreover, if domestic actors are able to share in the rents the government captures, they may even demand that the government intervene in the market. Thus, sanctions may generate a political dynamic in which domestic actors cooperate with the government in creating new economic institutions to manage trade.

On the other hand, once the target government establishes its position between international and domestic markets, it is able to exploit the differential between domestic and world prices. Acting as a monopsonist in world markets, the target government procures the sanctioned good for at or near its world price; however, the domestic market clearing price remains at P_d due to the restricted supply of the good available from world markets. The target government may either capture this differential for itself by selling the good at its market clearing price, or it may hold the good's price at P_w but ration it among domestic consumers. Both courses of action have domestic political payoffs for the target government. In the first case, the government may use the sanctions generated rents to subsidize important constituencies. In essence, the rents become a tax on domestic importers of the sanctioned good which is then redistributed to groups the government favors. In the second case, the target government can use rationing as a political resource either to build or consolidate its governing coalition by offering access to the sanctioned good

in return for political support.

Thus, economic sanctions create powerful incentives for target governments to intervene in sanctioned markets. Economically, by restructuring the domestic market as a monopsony, the target government is able to recapture at least some of the sanctions generated rents. Politically, by intervening between the domestic and world markets, the target government can exploit the difference between domestic and world prices to shift the costs of the sanctions or to strike deals with domestic groups. As a result, sanctions may strengthen the government domestically and hence increase its capacity to resist the demands of the sanctioning governments.

At least three other important implications follow from this discussion. First, it highlights the fact that economic sanctions create winners and as well as losers in the target economy. Sanctions on the target country's imports generate a transfer of surplus from domestic consumers of the imported good to import competing producers. Because import competing producers will capture this windfall as long as the sanctions persist, this group has strong economic incentives to encourage the target government to reject the demands of the sanctioning countries. Thus, this perspective suggests an economic basis for the highly nationalistic, go it alone responses within the target country which often accompany the imposition of

sanctions.[6]

Second, looking at sanctions from this perspective highlights the fact that sanctions-induced losses vary not only according to the elasticities of supply and demand for the sanctioned good, but also according to the structure of the market within which the sanctioned good is traded. Aggregate losses to the target country will be lowest when it is a monopsonist facing competitive foreign exporters; they will be greatest when domestic importers compete against one another to buy on world markets and face monopolistic foreign exporters. Thus, determining the economic impact of sanctions requires one to examine not only the nature of the sanctioned good, but the structure of its market as well.

Third, this discussion points out that the relationship between sanctions busting firms (foreign exporters) and the target government is far from cozy. Rather, it is characterized by substantial conflicts of interest. On the one hand, foreign exporters seek to maximize the amount of rent they receive from trading in the sanctioned market. By doing so, however, they inflict losses on the target economy to the

---

[6]See for example, Johan Galtung, "On the Effects of International Economic Sanctions, With Examples from the Case of Rhodesia," World Politics 19 (April 1967) pp. 378-416; and Gary Clyde Hufbauer and Jeffrey J. Schott, Economic Sanctions Reconsidered: History and Current Policy (Washington, DC: Institute for International Economics, 1985) p. 10.

extent the prices they charge exceed world prices. This contradicts the target government's desire to minimize losses to the economy by minimizing the amount of sanctions rent which flows abroad.

Thus, despite the fact that sanctions busting firms continue to supply the target country, their interests in the sanctions episode do not coincide with those of the target government. In fact, in some cases sanctions busting firms may even make the sanctions more effective by further restricting

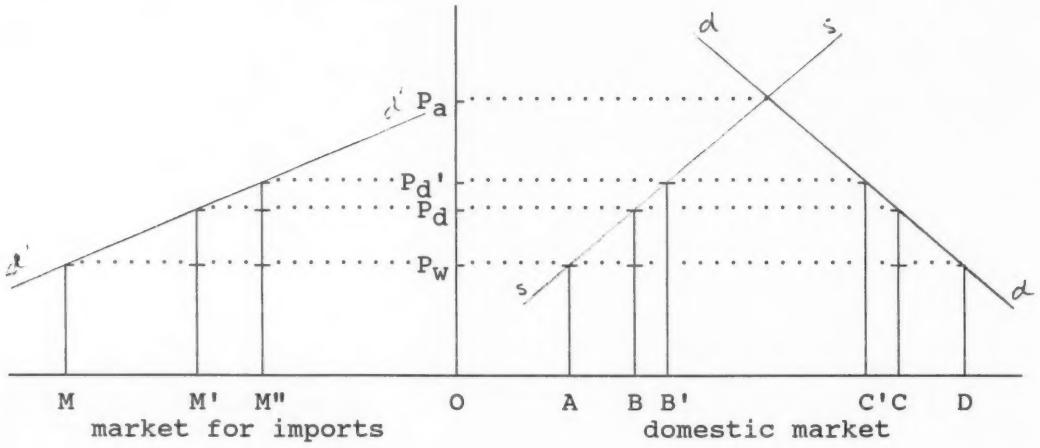

Figure 2

the supply of the good to the target country. In figure 2, the sanctioning countries limit the target country's imports of the sanctioned good to OM' (BC in the right hand panel), causing the sanctioned good's price to rise to P_d. Suppose, moreover, that the sanctions also facilitate collusion among the remaining, sanctions busting firms by shrinking the number of

suppliers to this market. If they collude, these firms can increase the rents extracted from the target economy by further reducing the supply of the good to the amount M" (or B'C'). This raises the good's price to P_d', yielding a rent of $[P_d'-P_w]B'C'$ which is greater than the initial sanctions generated rent of $[P_d-P_w]BC$. Thus, in certain cases, sanctions busting firms may actually increase the effectiveness of sanctions by further restricting the supply of the sanctioned good into the target economy![7]

This discussion of rents and sanctions shows that the conventional wisdom that the market effects of sanctions work against the interests of the sanctioning countries is only half true. Sanctions do generate rents which sanctions-busters exploit by supplying the target country; but whether these market effects work for or against the interests of the target government depends critically on the structure of the affected markets. Indeed, in cases where domestic importers compete to buy on world markets, the market dynamic created by sanctions imposes costs on the economy beyond the usual deadweight welfare costs associated with trade disruptions as the sanctions rent flows abroad. As a result, the target government must intervene <u>against</u> the market to minimize the economy's losses from sanctions. Moreover, the relationship

---

[7] There is some evidence that this actually occurred in the case of oil sanctions against Rhodesia. See David M. Rowe, "Slippery Business: Oil Sanctions Against Rhodesia," unpublished manuscript.

between target governments and sanctions busting firms is characterized by a substantial conflict of interest which may even lead sanctions busters to set prices against target country, paradoxically increasing the economic effectiveness of the sanctions.

CASE 2: Sanctions against a large country's exports

So far this paper's four propositions are based on the case where sanctions are applied against a small country's imports. Will they differ if the sanctions are applied against the target country's exports or if the country is large?[8]

Figure 3 depicts the case of sanctions against the large country's exports. The right hand panel depicts the domestic market for the exported good, with domestic supply and demand schedules given by **ss** and **dd** respectively. At free trade, the domestic price is given by the world price P_W. The country produces OD the good, while consuming OA. The excess of production over consumption, AD, is exported to world markets.

The left hand panel represents the target country's world

---

[8]It is important to remember that large and small refer not the physical size of the country, but rather whether the country's supply of exports or demand for imports is large enough to affect prices on world markets. Moreover, the same country can be large or small depending on the market in question. For example, Rhodesia would be a large country in tobacco as it supplied roughly 25 percent of world exports, but a small country in oil as its import requirements for this good were minuscule in relation to the world market.

market for exports. The target country's supply of exports to world markets is given by the curve **s's'**. It relates the quantity of exports supplied to the world markets to price by tracing out the difference between the domestic supply and demand schedules given in the right hand panel. At the autarky price, P_a, exports will be zero because domestic demand equals supply. As the price rises above autarky levels, supply exceeds domestic demand and the quantity of exports rises. Hence, the export supply schedule rises upward to the left.

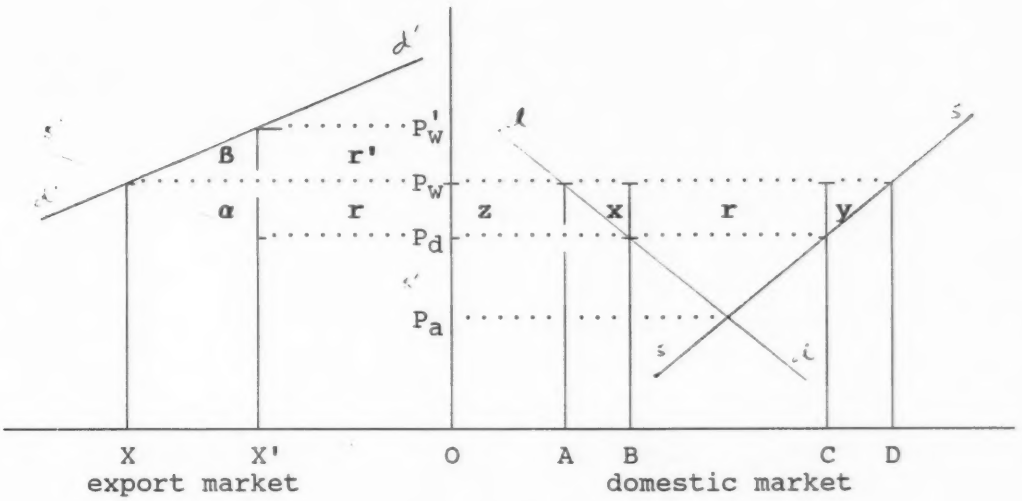

Figure 3

Because this is the large country case, world demand for the country's exports is given by the downward sloping schedule **d'd'**. Thus, shifts in this country's export supply schedule will affect not only the quantity of exports reaching world markets but also the world price, P_W, which is determined by the intersection of the two curves. At P_W the country exports

OX to world markets, which equals AD in the right hand panel.

Again, suppose some of this country's trading partners impose economic sanctions against it by boycotting OX-OX' of its exports. By reading first from the export supply curve **s's'**, one sees that the sanctions-induced fall in demand to OX' causes the sanctioned good's domestic price to fall to P_d. Domestic exporters, suddenly facing a reduced demand for their product, will competitively lower prices in order to secure sales to the few foreign importers remaining in the market. The sanctions' effect on world prices is obtained from the world demand curve **d'd'**, which shows that a drop in the target country's exports to OX' also drives up world prices to the level P_W'. The areas **α** and **ß** represent the deadweight losses of the sanctions. **α** is the deadweight loss suffered by producers of the sanctioned good in the target country. It is the amount of producer surplus lost due to the sanctions and is equal to the sum of the triangles **x** and **y** in the right-hand panel (simple geometry will confirm this). **ß** is the deadweight loss of surplus suffered by foreign consumers of the exported good; it represents foregone consumption of the sanctioned good. The area (**r+r'**) is the rent created by the sanctions. Foreign importers who remain in the sanctioned market can now buy the good for its domestic market clearing price, P_d. The world price, however, has risen to P_W'. Thus, those foreign importers who remain in the market can capture a rent equal to the

difference between the two price levels [P_W'-Pd] multiplied by the amount of exports, OX' (or BC). The rent itself has two components. The area **r** is producer surplus captured from domestic exporters who now receive a lower price for the good due to sanctions. The area **r'** is captured from foreign consumers of the sanctioned good who must now pay a higher world price.

Turning next to the domestic market, the effects of the sanction are similar to those of a sanction against the country's imports. The lower price to exporters causes production to fall from OD to OC and domestic consumption to rise from OA to OB. The triangles **x** and **y** represent the deadweight welfare costs of the sanction to the economy in terms of lost producer surplus. The area **z** is a transfer of producer surplus to consumers, who now enjoy a lower price for the good. The area **r** represents the (by now familiar) rents created by the sanctions; it is equal to the area **r** in the left-hand panel.

Examining this model reveals that the four propositions change only slightly when considering sanctions against the target country's exports or when the country is large. Export sanctions generate much the same dynamic between domestic and foreign actors as import sanctions. Because this is a competitive market, domestic exporters will respond to falling

demand by undercutting the prices of other exporters, resulting in a transfer wealth from domestic exporters to foreign importers. Foreign importers remaining in the sanctioned market can now procure the good at the price P_d while its world price has risen to P_w'. Thus, the sanctions set in motion a dynamic which causes the sanctions-generated rents to flow abroad. Again, the target government can reverse this transfer by organizing the traded market, this time as a monopoly. The government's new export agency first buys the good from domestic producers and then sells it to foreign importers. By acting as a single seller on world markets, the government should be able to bid the foreign buyers up to a price closer to the prevailing world price.

But creating a monopoly in the export market will also have internal consequences. To be effective, the government's new export agency must not only eliminate price competition among domestic exporters (producers), it must also be able to control their output. Should the recaptured rents be passed back to producers in the form of higher prices, this could lead them to increase output and thereby undermine the government's export monopoly. The target government may solve this problem in several ways. It can buy up any excess output which it then keeps from export markets; it may limit output through a series of production quotas; or, it may prevent any rise in output by simply not passing the recaptured rents back to domestic

producers.

Each course of action has political payoffs for the target government. The first two entail transfers of income back to domestic producers which the government may use as a means of building or maintaining its governing coalition. However, these two courses are not identical in terms of their political implications. If the government maintains its monopoly position by simply buying up and holding off the export market all excess production, its price to the domestic producer becomes a form of public good. Each producer enjoys this price regardless of whether he supports the government; thus, this policy comprises a very weak instrument for a government seeking to build or maintain a political coalition. The second course of action, higher prices coupled with production quotas, provides the government with a much more potent instrument. This policy also distributes wealth to domestic producers of the country's export. Yet, the higher price realized by domestic producers is now a divisible good because individual producers must first obtain a production quota from the government. The government's ability to either offer or withhold quotas thus becomes a means by which to ensure the political loyalty of this group.[9] Third, the government may

---

[9]The government's choice between these two policies may be an indicator of its relative strength vis-à-vis the producer group. The producer group will prefer the first policy, as it shifts the costs of maintaining the monopoly in the export market entirely onto the government. The government, on the

choose to control output by not passing the higher prices it obtains on export markets back to the producer. In this case, the captured rents become a tax on domestic producers of the sanctioned good which can be redistributed to groups the government favors.

Thus, sanctions on the target country's exports generate incentives similar to those which lead the target government to intervene when sanctions are applied against the country's imports. Moreover, because the two types of sanctions create a similar dynamic, two other propositions derived from the basic model also hold. The costs of sanctions will vary according to the structure of the traded market; and, there will be substantial conflicts of interest between the target government and foreign traders who continue to buy the target country's exports.

In fact, the export case differs significantly only in terms of the domestic distributive effects of sanctions. Here, sanctions generate a transfer from domestic producers of the sanctioned good to domestic consumers. Although sanctions also create winners in this case, they are less likely to create domestic constituencies in the target country which favor seeing the sanctions continued. The reasons are twofold.

---

other hand, will prefer the second, as it provides a means by which to enhance or consolidate its political power.

First, because they accrue to consumers, the benefits from export sanctions will be more thinly dispersed across the economy than in the case of import sanctions. Second, consumer groups are also less likely to be organized than are producer groups. Thus, even though consumers may win from export sanctions, there is a lower likelihood that they will be able to voice this preference effectively.

Finally, this model also points out that the main difference between the large and small country case is that the target government's incentives to intervene will be even stronger when the sanctioned market is large. Sanctions in the large country case generate rents from both domestic and foreign actors in the sanctioned market. By organizing the domestic market into a single actor, the target government can both recapture the rents from its own citizens which initially flowed abroad, as well as extract rents from foreigners (here represented by r'). This raises the possibility that the government's intervention may even make the economy better off than before sanctions were imposed. Whether this turns out to be the case depends critically on the relationship between α (the costs sanctions impose on the target economy) and r' (the foreign-generated sanctions rent). If $\alpha > r'$, the country will suffer net losses from the sanctions; if $\alpha = r'$, the net cost of sanctions will be zero; if $\alpha < r'$, the country will actually

gain from having sanctions imposed on it.[10]

CASE 3: A dynamic view of sanctions

So far this paper's treatment of sanctions has been static. It assumes that there is no subsequent entry into sanctioned markets by other actors which dissipates the sanctions rents. This is unrealistic. Rents will encourage new entrants into the market which, in turn, will also cause the gap between world and domestic prices to narrow. Thus, the target government may be able to minimize the costs imposed by sanctions by seeking a "market" solution in which it does not intervene. Instead, it allows the market to settle at some post-sanctions competitive equilibrium. In the third case, I consider this possibility by creating a rudimentary three stage "dynamic" model of sanctions.[11]

Figure 4 is the (reversed) left-hand panel of the model, representing the small country case where sanctions are applied against the target country's exports. The target country's export schedule is given by the upward sloping curve **s's'**; the foreign demand for this country's exports is given by the world price line, P_W.

---

[10]Assuming, of course, the government is able to capture the entire amount of the rent **r'**.

[11]The term "dynamic" is a misnomer. The model actually consists of three static snapshots of the sanctioned market connected by a verbal description of the dynamic changes occurring in this market.

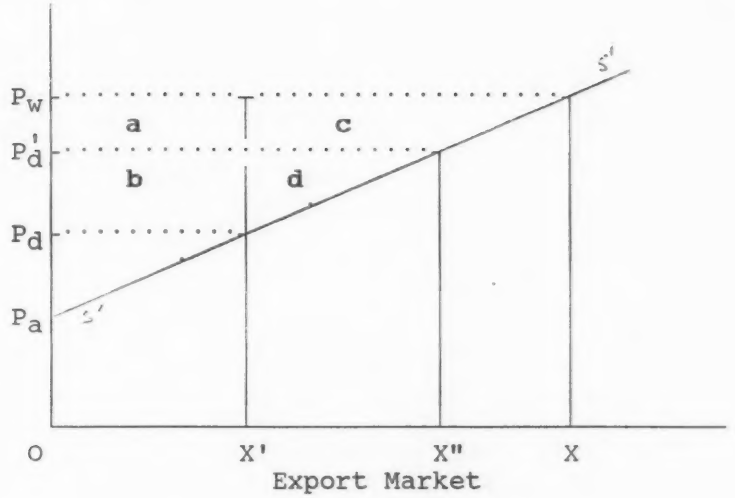

Figure 4

Three time periods are depicted here. In the first period, the country is at free trade. It exports OX of the good at the world price P_w. The second period depicts the initial shock created by a boycott OX-OX' of the country's exports. The effects of the boycott are already familiar to the reader. The sanctions-induced fall in demand causes domestic exporters to drop their prices to P_d, while world prices remain at Pw. The falling price for the target country's exports generates welfare losses to the target economy (areas **c+d**) consisting of lost producer surplus, as well as a sanctions rent (areas **a+b**) which flows to those foreign importers not participating in the sanctions.

The third period represents the post-sanctions equilibrium. The initial shock of the sanctions induces new

entrants into the market who seek to exploit the differential between domestic and world price levels. By entering the market to buy the good at its sanctioned price P_d while its world price remains P_w, these actors attempt to capture for themselves the rents created by sanctions. However, as more actors enter the market to exploit the difference in prices, demand for the target country's export rises. This bids up the price offered to domestic exporters to P_d' while also increasing the quantity of exports to OX".[12] Moreover, because there is free entry into the market, P_d' now represents a competitive price for the target country's exports, as well as its new (sanctions-distorted) world demand schedule. Thus, the post-sanctions equilibrium is characterized by levels of prices and exports which lie above the levels realized under the initial shock of sanctions, but which may remain below the levels of free trade.

Several important implications follow from this dynamic view of sanctions. First, although the target government may be able to pursue a market response to sanctions, there nonetheless remain strong incentives for it to intervene in the market to organize trade. Consider the case where the target

---

[12]Note that the domestic price for the sanctioned good could return to the level of world prices given new entry into the market. In this discussion, I assume that prices will not return to world levels either because the new entrants either demand a discount to cover the risks of trading in the sanctioned market, or because the methods used to circumvent the sanctions (such as transshipment) entail significant costs.

government chooses not to intervene. In this instance, the target economy sustains losses equal to the sum of areas **a** and **c**. Because P_d' is a competitive price, these areas represent a sanctions discount which must be offered to foreign importers to cover the risks of operating in the sanctioned market (the area **a** plus that portion **c** to the left of X"), as well as the deadweight welfare losses imposed on the target economy by sanctions at the new price level (the area **c** to the right of X"). On the other hand, the target economy gains by recapturing the areas **b** and **d**. Both areas represent surplus reaped by domestic producers in the form of higher prices; **b** is a portion of the original sanctions rent which is recaptured because of the increased demand in this market, while **d** represents the recovery of some of the deadweight welfare losses initially imposed by the sanctions.

Whether this outcome is superior to one where the target government intervenes in the second period to capture the sanctions-generated rents depends on a comparison of the costs imposed on the economy under each strategy. When the government chooses not to intervene, the sanction's net costs to the country are areas **a+c**; if the government intervenes, the country loses **c+d**. Thus, the government's decision to intervene turns critically on whether the deadweight welfare losses it recovers by pursuing a market solution (**d**) exceed the sanctions rents it would forego (**a**). If **d** > **a**, the government

should not intervene; if **d** = **a**, the government will be indifferent between the two courses of action; if **d** < **a**, intervening remains the government's optimal strategy.[13]

Moreover, each course of action has different political payoffs for the target government. Pursuing a market response results in the recovery by domestic producers of some of the losses in producer surplus imposed by the sanctions. However, this strategy also entails a significant opportunity cost for the government. By forgoing intervention, the target government also forgoes the opportunity to use the sanctions rents as a political resource in its process of building or maintaining a governing coalition. The upshot is that even if the welfare gains from a market response to sanctions exceed the forgone sanctions rents, the government may nonetheless opt to intervene. The sanctions rents may simply prove to be too enticing a political resource for the target government to let them slip from its grasp. Thus, even in this dynamic view of sanctions, there still exist strong incentives for the target government to organize the traded market as a single actor.

The second implication of this dynamic view of sanctions is that the government must intervene in the second period, when the market exists in a state of disequilibrium. It is the

---

[13]Please note that this will be an intertemporal comparison. That is, the government must make its decision based on its expectations about the relative sizes of **a** and **d**.

disequilibrium caused by sanctions which creates the political space for the target government to intervene in the economy. Intervening at this stage imposes few, if any, costs on domestic society, because the rents the government captures are flowing abroad. Thus, societal resistance to the further extension of government control over the economy is likely to be low. In fact, actors in the market may even demand government intervention as a way to recapture at least some of the sanctions rents.

However, once the (sanctions-distorted) world demand schedule establishes itself at P_d', the opportunity for the target government to intervene in the economy disappears. The government cannot now intervene to capture the sanctions rents because the rents no longer exist; they have been dissipated by the entry of new foreign actors into the market. P_d' is a world price over which the target country cannot exert any influence. Thus, any attempt by the government to raise the price of its exports by creating a monopoly in the export market will only impose costs on domestic producers -- a course of action they are likely to resist.

This raises two important points. First, the rate at which the sanctioned market clears becomes a critical variable for whether governments can intervene. The faster the market clears, the less time available to the government for extending

its control over this sector of the economy. Second, this discussion also yields a prediction about the timing of government intervention. It is while the economy is in disequilibrium that the incentives emerge which lead the target government to organize the sanctioned market into a single actor. Thus, the target government will erect these new economic institutions shortly after sanctions are imposed, but before the economy reaches a new state of equilibrium.

Finally, this dynamic view of sanctions points out the need for a better understanding of the process by which markets move from one equilibrium to another. For it is precisely in the dis<u>equilibrium</u> phase of the sanctions' impact on the target economy that the incentives arise for the target government to intervene extensively in the sanctioned market. Moreover, it is also during this phase that societal resistance to the extension of government control over the market is lowest. Yet, a static comparison of the pre- and post-sanctions equilibria of this market would miss these aspects entirely. Thus, this rudimentary model not only provides insights into the behavior of the target country under sanctions, it also pushes at one of the most important problems on the research frontier of political economy -- creating a dynamic theory of economic and political change.

* * * *

This paper has explored three variants of an extremely simple model of economic sanctions. Despite the model's simplicity, I have arrived at several powerful propositions concerning the likely behavior of a country undergoing sanctions. In static versions of the model, I have shown that sanctions create incentives which will lead the target government to intervene extensively in the sanctioned market; that they may create constituencies inside the target country who have an interest in seeing the sanctions maintained; that the cost of the sanctions to the target country varies according to the structure of the sanctioned market; and that the relationship between sanctions busters and target governments is characterized by substantial conflicts of interest. By exploring a simple dynamic version of the model, I also arrived at a prediction concerning the timing of the government's intervention in the market, as well as demonstrated the need for understanding better the process of economic and political change.

Elegant theoretical frameworks, however, are worthless if they cannot explain facts. Fortunately, this framework seems to perform well empirically. It accounts for many of the stylized facts about sanctions which can be distilled from the literature. First, it explains the observation that economic sanctions often cause the target government to intervene

extensively in the economy. For example, Renwick writes that "Sanctions almost invariably result in increased state intervention in the economy to which they are applied as governments introduce or intensify import and other controls to mitigate their effects."[14] Likewise, Schreiber finds that Castro was able to use the sanctions against Cuba as a means of extending totalitarian control over the country.[15]

Another stylized fact concerning sanctions is that they are often counterproductive because they can cause the target populace to rally behind the government. In fact, the idea that sanctions "create their own antidotes" is one of the most common conventional wisdoms concerning the impact of sanctions on the domestic political behavior of the target country. By pointing out that sanctions may actually benefit strong constituencies inside the target country, this framework suggests that there may be an economic basis for this oft-noted response by the target country to sanctions.

Third, the model's treatment of the dynamics of sanctions seems to capture well the process by which sanctions generate rents, which, in turn, induce other private actors into the

---

[14]Robin Renwick, Economic Sanctions, Harvard Studies in International Affairs (Cambridge, MA: Center for International Affairs, 1981) p. 80.

[15]Anna P. Schreiber, "Economic Coercion as an Instrument of Policy: U.S. Measures Against Cuba and the Dominican Republic," World Politics, 25 (April 1973).

market. Licklider notes that "the consequent rise in price makes it too profitable for individuals and groups not to supply it (the sanctioned country) by hook or by crook." Hufbauer and Schott note that sanctions invariably lead to higher prices for the sanctioned good, and that these prices, in turn, attract new entrants into the market.[16]

Finally, this model offers a powerful explanation for the most important stylized fact in the sanctions literature -- that using sanctions to compel desirable changes in the target country's behavior is a very difficult enterprise. I show that sanctions may create domestic constituencies inside the target country who favor seeing the sanctions continued. More importantly, I also show how sanctions may lead the target government to intervene extensively in sanctioned markets and how the government may then exploit its new position in these markets to consolidate or extend its domestic political power. As a result, sanctions may end up strengthening the target government, and hence enhance its ability to resist the coercive attempts of the sanctioning governments.

THAT OBSCURE OBJECT OF DESIRE:
"The Environment" and Contemporary Environmentalism

by

Charles T. Rubin
Duquesne University

Prepared for the panel "Environmentalism and Political Philosophy," Science and Technology Studies Section, American Political Science Association annual meeting, Washington D.C. September 2-5, 1993

Few would quarrel with the assertion made by writers with perspectives as different as Walter Rosenbaum and William Tucker that we live in an "environmental era" or the "age of environmentalism."[1] And yet despite, or perhaps because of this sense that our time is specially one of environmental concern, there is much dissatisfaction with what we have accomplished in this age. Norman Vig and Michael Kraft are typical in castigating "official Washington" for failing to take environmental problems seriously enough. Nevertheless, they have argued, the early 1990s present "reasons for greater optimism" that the "global ecological crisis" will be taken "more seriously." Their optimism goes along with the suggestion that it is time for a new look at environmental issues, and the development of a "new agenda." The first thing necessary is "to rethink the nature of the policy problems themselves, and to broaden and deepen our concept of the environmental agenda."[2]

It is always encouraging to see people eschew crude pragmatism and acknowledge the link between policy problems and conceptual foundations. But what do Vig and Kraft come up with for their conceptual deepening? We need, they tell us, to be aware of ever "more threats to human health and ecological systems," and in so doing develop a "truly global environmental agenda" that includes understanding the connection between the environment and "virtually every other issue" including national security.[3]

There are three remarkable things about this recommendation. The first is how unremarkable it is. The search for new threats to our health and well being has been a staple of the environmental agenda at least since Silent Spring. Barry Commoner long ago observed the interconnection of the environment with social, political and economic issues.[4] U Thant, then Secretary-General of the United Nations, gave a speech in 1970 that called for "a global authority" that could "enforce its decisions for the benefit of the world community" in dealing with "the problems of the environment."[5] In the

absense of such an agency, U.S. environmental policies throughout this period did concentrate on more narrowly focused issues. But no "rethinking" is required to criticize that focus; it has long been regarded by activists as a defect, i.e. just the sort of fault that makes Vig and Kraft's complaints about "official Washington" plausible.

All its familiarity should not prevent us from stepping back and noticing the second remarkable thing about this supposedly "new environmental problematique": the sheer scope of its definition of environmental problems. When they are linked, as Vig and Kraft do, to eliminating poverty; stabilizing population; raising living standards; and such diverse factors as climate change, social disruption, political instability, trade patterns, raw materials, and military spending, what actual or potential action of government is not included within the rubric of "the environment"?[6]

Yet the third, and perhaps most remarkable, thing about this not-so-new and not-so-much-rethought "concept of the environmental agenda" can be seen if we take yet another step back from it. Imagine for a moment that we were talking about something other than the environment, and we were told that this Problem X had to be dealt with at a global level, that it was connected to all political, social and economic problems, that dealing with it would require vast changes in the way people lead their lives all over the world. Would one not want a rather careful definition of Problem X? For decades, for example, people have debated about the meaning of "class struggle," or "capitalism," "imperialism," "totalitarianism," problems that were said to be urgent, and require global and far reaching efforts. These definitional debates informed the various revolutionary (or counter-revolutionary) agendas that followed, and allowed those who agreed or disagreed with them a starting point against which they could judge the plausibility of the claims that were being made about the problem and its purported solution.

Vig and Kraft, on the other hand, never come right out and say what the environment is. There is, at best, an implicit definition in the long list of issues that we are to connect with rethinking the concept of the environmental agenda: the environment is everything. This definition, however, cannot be made explicit, since serious political scientists would hardly want to claim credit for articulating the "new tout problematique."

Vig and Kraft are simply examples of a widespread problem that dogs contemporary environmental thinking and policy making. Their failure to define "environment" when explicitly concerned with conceptualizing environmental problems is regrettable, but not unusual. In this as in so many other ways, Vig and Kraft simply embody the conventional wisdom. This paper, on the other hand, is an attempt to challenge that convention by an explicit look at the meaning of "the environment" and its consequences for the movement and policies made in that name.

* * *

The environment, along with its cognates "environmentalism" and "environmentalist" have become such accepted parts of the language that it is easy to forget what new, and rather strange, words they are. As late as 1972, an extremely thoughtful essay on what we would now call "environmentalism" was published as "Roots of the New Conservation Movement."[7] "Environmentalist" and "environmentalism" do not even appear in my 1966 American College Dictionary; only the latest (1987) supplement to the Oxford English Dictionary includes them. At that, most of the definitions refer to the meaning the terms have as anthropological or sociological schools of thought. The first example provided of "environmentalist" in its now popular sense comes from a 1970 New Yorker article.

Citations under "environment" in The New York Times yearly index tell the story of a word moving from relative obscurity to spectacular success. In 1955 the word is not indexed; in 1960 there is one citation to a story about environmental science and the aerospace industry. Of course the Times covered stories about pollution and man's effect on nature in this period. But they were considered stories about discrete if serious problems, not about a grave threat to some overarching entity called "the environment." In 1965 the word is first found as a heading in its present sense, and there are two citations. By 1970, the year of the first "Earth Day," there were 86 paragraphs under the heading, taking up nearly two pages of the index, many paragraphs containing citations to more than one story. After that things settled down a bit: 30 paragraphs in 1975, 73 in 1980, 41 in 1985. In 1990, however, the 20th anniversary of Earth Day, there were 172 paragraphs, some two and a half index pages, under the heading of "environment."[8]

What is the meaning of his magical word, that seems to unify so many diverse phenomena? In that old American College Dictionary "environment" is defined primarily as "the aggregate of surrounding things, conditions or influences." The Oxford English Dictionary, despite its updating of examples, maintains its original definitions of "environment" nearly unchanged; hence we are left with "The action of environing; the state of being environed," and "The conditions under which any person or thing lives or is developed; the sum-total of influences which modify and determine the development of life and character." The examples provided suggest that the word came into its own in the 19th century, with Herbert Spencer speaking of soil and air as the "two halves" of the environment, and Henry Sidgwick asserting that organisms are "continually adapted" to their environments. One must turn to a dictionary of the vintage of Webster's Ninth New Collegiate Dictionary (1990) to find a sharper distinction drawn between "environment" as a term refering to "social

and cultural conditions" and to "the complex of physical, chemical, and biotic factors (as climate, soil, and living things) that act upon an organism or an ecological community and ultimately determine its form and survival." Yet even this definition only hints at how one might get from the multitude of factors that might constitute the particular environment of a given organism ("an environment") to the even more comprehensive idea of "the environment" which is so commonly referenced today.

Dictionaries, we know, are hardly reliable when the word in question has specialized or philosophic uses, and perhaps the above cited definitions do no more than vindicate this mistrust. For if they say the last word about "the environment," we would have to admit that the term is little more meaningful than a sweeping gesture to whatever is "out there." Its usefulness would reside in the extent to which it frees us from the necessity of discrimination among cases and circumstances, providing both the same ease of use and potential for overuse as a file folder labeled "miscellaneous."

But such a conclusion is as yet premature. Are there not more specialized and exacting uses of the term? Let us look at some typical examples of how it is employed in the environmental literature.

To reconstruct what Rogene A. Buchholz believes we need to manage in Principles of Environmental Management: The Greening of Business is no easy task. He does not list "environment" as one of the "Important Concepts of Ecology" even though ecology is "the study of organisms and their environment." The implicit suggestion that "environment" is anything that is not an organism seems to be confirmed when he notes that an ecosystem is made up of the interaction of organisms plus "the chemical and physical factors making up their environment."[9]

Perhaps Buchholz believes that the business students to whom his work is addressed will have had a course in environmental science that made them familiar with the term in a more rigorous way. If so, he had best hope that they did not use the Penelope and Charles ReVelle text, The Environment, where the term does not show up in the glossary and gets no treatment in the places one might expect to find it in the text.[10] On the other hand, Bernard J. Nebel provides his readers with a glossary entry that would give the lie to Buchholz; environment is "The combination of all things and factors external to the individual or population of organisms in question."[11] In other words, Nebel suggests that one organism can be part of another organism's environment, i.e. he goes beyond "physical and chemical factors." So doing suggests the possibility of a complex of interlocking environments; the bunny is part of the hawk's environment, and vice versa. We begin to see how "an environment" can lead to "the environment."

Nebel here seems closer to the mark set by Barry Commoner in The Closing Circle. "The environment makes up a huge, enormously complex living machine that forms a thin dynamic layer on the earth's surface . . . This machine is our biological capital, the basic apparatus on which our total productivity depends."[12] Here, "environment" comes to be equated with what is sometimes called the biosphere, with the additional implication that while we are in it, human beings are somehow not of it--at least, it comes ready made to us as capital. And yet elsewhere, Commoner says that "the environment is, so to speak, the house created on the earth by living things, for living things."[13] This statement, which makes the environment sound less like capital and more like labor, suggests a yet more inclusive rubric, and one more consistent with the fact that Commoner is curiously unable to describe the environment without reference to human artifacts.

It begins to be clear why in 1969 the American Chemical Society called the environment "a global system of almost infinite complexity." But it gets worse. So far, "environment" looks much like what might once have been called "nature." But the environment, the ACS added, is "by nature thoroughly geopolitical." It is a broader category than "nature," yet apparently not quite all inclusive, for the report speaks mysteriously of "the environment and the associated phenomena." It is a system "made up of a bewildering number of subsystems that often are only distantly interdependent," a point which the ACS notes in order to suggest skepticism about the usefulness of a "systems analysis" of this "system."[14]

What are some of these bewildering subsystems? Another of environmentalism's founding fathers, Paul Ehrlich, once expressed the fear that "All too many people think in terms of national parks and trout streams when they say 'environment.'" But "Slums, cockroaches, and rats are ecological problems, too. The correction of ghetto conditions in Detroit is neither more nor less important than saving the Great Lakes--both are imperative." Hence "'Environment' must be broadly construed to include such things as the physical environment of urban ghettos, the human behavioral environment, and the epidemiological environment."[15]

If the meaning of the word seems to be ballooning significantly one might still wonder why in principle we should restrict "environment" to external conditions in the "thin layer" of the biosphere that Commoner speaks of, man-made or otherwise. No one knows as well as he the important role the sun plays in maintaining that environment, and one could also point to the moon, or to the deep rocks that are the source of volcanoes. Are these, then, to be excluded from "the environment," simply in virtue of their depth or distance? Not if we follow the logic of Beyond Spaceship Earth: Environmental Ethics and the Solar System, whose contributors would have us

pay more attention to pollution in Earth's orbit, the ecological problems of space colonies, and (as its ad copy states) "the moral status of extraterrestrial life, and the preservation of nonliving value in the solar system."[16]

We begin to understand better the treatment William H. Rodgers gives "the environment" in his text Environmental Law. He quotes another law professor: "The environment is not a modest concept, it embraces. . . 'the universe and all that surrounds it.'" (The internal quote is from comedian Peter Cook.)[17]

This note, though lighthearted, is no mere law-text joke. Authors of environmental law texts are mightily and favorably impressed by the vast scope of the cases and controversies that are available to them.[18] In part, that is because we have a National Environmental Policy Act that maintains the tradition of implicit yet broad definition of the environment that we have so far seen in other sources:

> The Congress, recognizing the profound impact of man's activity on the interrelations of all components of the natural environment, particularly the profound influences of population growth, high-density urbanization, industrial expansion, resource exploitation, and new and expanding technological advances and recognizing further the critical importance of restoring and maintaining environmental quality to the overall welfare and development of man. . .[seeks to] create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans.[19]

Add to these goals and issues that Americans are to have "safe, healthful, productive, and aesthetically and culturally pleasing surroundings," and an environment that supports "diversity and variety of individual choice"[20] and you get some idea of why there are now more environmental lawyers than labor lawyers in the United States.[21]

In Metropolitan Edison Co. v. People Against Nuclear Energy (460 U.S. 766) Justice Rehnquist noted that

> If we were to seize the word 'environment' out of its context and give it the broadest possible definition, the words 'adverse environmental effects' might embrace virtually any consequence of a governmental action that someone thought 'adverse.' But we think the context of the statute shows that Congress was talking about the physical environment--the world around us, so to speak.[22]

Rehnquist's intuition may be better than his ability to read the statute; given the laundry list of goals noted above, this remark does not seem to embody judicial restraint, however much it restrains the scope of NEPA. Still, "the world around us, so to speak," is already impressively inclusive, even had the statute not linked "the environment" with a whole host of goods, past, present and future, that go far beyond the "physical environment," (which again is hardly a small category).

The Supreme Court's reading would perhaps not satisfy Lynton Keith Caldwell, one of the architects of the NEPA. While in International Environmental Policy Caldwell believes his readers need an explicit definition of "policy" and discussion of what makes an issue international, he provides no like treatment of "environment."[23] Still, speaking at the "high level of generality" he believes appropriate to the "far-reaching scope of the subject,"[24] Caldwell suggests that

> The environmental crisis is an outward manifestation of a crisis of the mind and spirit. There could be no greater misconception of its meaning than to believe it to be concerned only with endangered wildlife, human-made ugliness, and pollution. These are part of it, but more importantly, the crisis is concerned with the kind of creatures we are and what we must become in order to survive."[25]

In other words, "Mankind's environmental relationships thus comprise a profound problem in human psychology."[26] Thus we come full circle to the Oxford English Dictionary definition, as "the environment" is anything and everything which contributes to making human beings of a certain character. (An implication of Caldwell's usage, which may differ from what the OED is suggesting, is that we are fully in control of what we are to become.)

This exploration of the way in which "environment" is typically defined suggests that whatever internal logic the term has promotes a relentless expansion of its meaning. (We will meet this tendency again when we discuss one of the hallmarks of environmental thinking, that "everything is connected to everything else.") The result is that for once the dictionaries have it more or less right. We would do little conceptual violence, and perhaps clarify for ourselves some of the problems we have had in thinking about, and formulating policy concerning, the environment if we simply replaced "environment" by "everything," and likewise started to speak about "everythingists" and "everthingism."[27]

As we will discuss in more detail later, a reform movement that attempts to deal with everything is obviously going to face an uphill battle when it comes time to make concrete policy choices. This admission might lead a skeptic of my case thus far to suggest that, if it proves anything at all, it proves too much. "Obviously" environmentalism is not really everythingism, because no reform movement could possibly present such an agenda seriously. Something must prevent its actual agenda from becoming "everythingism."

In return, as a skeptical observer of the environmental movement, I could point, for example, to environmental crises of the moment, to the vast proliferation of mutually contradictory apocalyptic scenarios, to the large number of jealously sectarian environmental organizations, and wonder whether the environmental agenda is quite as much under control as the skeptic on the other side seems to suggest. But for the moment, let us take the original objection at face value. Many constraints other than principles (e.g., of time, money, organizational focus, membership appeal, political salience) act to confine interest group agendas, and such factors are as powerful for the environmental movement as they have been for every other interest group. But beyond such constraints, there seem to be two simple reasons why

"environmental problems" are less difficult to define than "the environment" itself is: we can rely on our common sense, or on science, to tell us what they are.

Twice Environmental Protection Agency Administrator William Ruckelshaus put the common sense argument succinctly when he noted that "most people do not need a scientific panel to tell them that air is not supposed to be brown, that streams are not supposed to ignite and stink, that beaches are not supposed to be covered with raw sewage."[28] But there is less truth to this truism than meets the eye. Not all that long ago, the stink of raw sewage was simply a fact of life, and within the memory of my generation the belching smokestack was a symbol of progress and power. As I was growing up, drainers of swamps were still accounted net benefactors of mankind. In Pittsburgh, many did, and some still would, agree with the barber who said, "When smoke is pouring people get a haircut. When there isn't smoke, people don't spend money."[29] A 1915 Congregational hymn contains the lines, "The Wilderness is planted, the deserts bloom and sing; On coast and plain the cities, their smokey banners fling." Changing the public perception of such things required not only that they come to be seen first and foremost as "pollution." It also required adoption of a perspective from which brown air and smelly streams were all "environmental problems." Common sense might have been tempted to say that there is at best a tenuous relationship between fouled beaches and brown air, beyond the obvious one that both involve something where we do not want it. It took more-than-common sense arguments about, for example, the supposed bad effects of capitalism, or biblical religion, to get people to connect such different things together.

If "common sense" can be benighted, then surely modern natural science is responsible for its enlightenment. Science, we know, is very good at

uncovering otherwise hidden connections. We are ready to listen to it, since the progress of science is seen as intimately linked with our national prestige and well being. As befits the provider of so many goods things, science becomes an increasingly powerful public authority. On this view, science seems to be the origin of the rubric of "the environment," and for the definition subsequently of particular "environmental problems."

There are several difficulties with this explanation. The first is the increasingly open secret that much existing environmental policy has only the slimmest scientific foundation. In May 1991, EPA Administrator William K. Reilly commissioned a four member panel to examine how his agency used scientific data in its decisions. The result was a report highly critical of the EPA for failing to take the appropriate science into account, and for failing to employ the best scientists. In other words, while there is widespread agreement that the best available science should inform environmental policy, the EPA is weak in its ability to generate or even use such information. Reilly vowed to change all that by reorganization and special efforts to attract better scientists to the agency.[30]

This finding would come as no surprise to the EPA's more perceptive critics,[31] nor is it a weakness that the Agency itself has only just been made aware of. As early as 1985 then-EPA Administrator Ruckelshaus was admitting that EPA science was inadequate and promising improvements.[32] This admission is particularly ironic, since as the agency's first Administrator he turned the EPA away from making scientific research the foundation for its policy recommendations.[33]

Better science will only take the EPA so far, for problems do not announce themselves, even after science has spoken. Science can point out the existence of certain situations, but to make these states of affairs into problems, we need to believe that some other state of affairs is both possible

and desirable. For ages nobody thought that infant mortality was a problem; it was a fact of life, part of the human condition. It became a problem only when people began to imagine that things didn't have to be that way, and when they gained the power to change them. Gravity, on the other hand, is still not a problem; no one seriously anticipates doing anything about it. Until very recently the fact that an asteroid or comet could collide with the earth was simply a fact of life well known to astronomers and geophysicists. Now that some believe such an event could be prevented, it is being taken up by experts and popularizers as a problem requiring public action.[34]

That the existence of a problem requires both a view of how things should be different and the power to make the change is an insight well established (if not entirely uncontroversial) in the study of public policy.[35] The consequence for environmental issues is not often explored, since it is to the advantage of those most concerned about the environment not to disturb the common-sense or scientific veneer with which their arguments are covered. But consider urban air pollution. How did the existence of certain substances in the air, a fact that can be ascertained by science, turn into a problem which now "everyone agrees" we should do something about? Are those substances a problem because they threaten human health, or the health of other living beings? Because they might harm everyone, or because they are bad for some already weakened by disease? Is it a problem because of a hubristic modification of the God given atmosphere? Is it a problem because of an aesthetic revulsion against smog and dirty air? Or because we want our grandchildren to be able to see the great spectacle of the city laid out before us that is now only visible on a "good day?"

And what is the cause of the problem? Let us assume that it has a great deal to do with cars. Does urban air pollution exist because we have too many

people driving too may cars, too many people altogether, too many badly designed cars, or a badly designed transportation system that puts too much reliance on cars? Is it caused by a dangerous individualism that makes us like cars in the first place? By industries that seek profit at the expense of the environment? Or by industries that are behaving rationally given that they are allowed to treat the environment as a commons, rather than having to internalize the costs of pollution? Perhaps the problem is that we have cars and industry at all.

In each case, a different goal or endpoint of policy is suggested by the different understanding of the problem. It's not enough to say we want clean air, or even only cleaner air. If the problem is too many people, we would want population reduction policies. If it is badly designed cars, we need technological regulation. If we want to protect human health, we would focus on some kinds of pollution before others; if we want a pristine atmosphere, we need to take on everything at once. To say we all want cleaner air does not tell us what that means and how much change is required, nor when we want it and at what cost, nor how to weigh this goal against others--all issues that actually define policies.

As Ruckelshaus far more perceptively noted, the creation of problems needs more than science, it requires also some "vision of how we want the world to be,"[36] some ideal against which the present is found wanting. Modern science is what it is precisely because it eschews the attempt to find rational or empirical justifications for such norms. It may or may not be correct to make this kind of distinction between facts and values, but it is a condition of modern science's existence that has to be appreciated and respected.[37]

Where then do the visions that support the environmental movement come from? One does sometimes come across the claim that at least one branch of

science, ecology, is uniquely capable of providing the normative guidance to see what situations represent problems that require attention. This line of thought is particularly evident in some of the earliest popularizers of the new environmental consciousness, particularly Rachel Carson and Barry Commoner. A closer look at their thinking on this point shows it is not so easy for ecology to fill this role.

Rachel Carson's many supporters celebrate the fact that she introduced a vast public to the need for a moral re-evaluation of our relationship with nature, based in large part on an ecological perspective that taught the necessity of respecting the "balance of nature." This idea has indeed had great persistence among the general public. Ironically, in 1962 ecologist LaMonte Cole could already assert that the balance of nature "is an obsolete concept among ecologists," and that judgement has, if anything, been strengthened in the time since.[38] Nevertheless, one sees in Carson the reasoning that makes people think that there is a delicate and static balance of nature, and that "upsetting" it is a particularly reckless deed. At the same time, a look at Carson's own metaphors and examples suggests the difficulties and ambiguities of this concept.[39]

Silent Spring presents the current human relationship to the environment as that of both poisoner and poisoned. The imagery of death and disaster that she uses to such great effect is supported by a notion of the balance of nature as something that cannot be ignored any more than a "man perched on the edge of a cliff" can defy the "law of gravity."[40] In other words, we face a situation in which the slightest misstep will be final. After all, it took "eons of time" for life to reach "a state of adjustment and balance with its surroundings" that we see around us.[41] In a moment mankind can disturb this delicate balance. And because "in nature nothing exists alone," such

disturbance will have the most far reaching consequences.[42] Thus, Carson feels justified in speaking not of "pesticides" and "herbicides," i.e. poisons with specific targets, but of "biocides."

If everything is connected to everything else in a finely tuned balance, then physically and temporally remote, or speculative problems of pesticide use, on which Carson places a good deal of stress, become a plausible substitute for looking at positive immediate consequences such as prevention of epidemics or increased crop yields, which she touches on only in passing. Her argument that small, repeated doses eventually can have widespread and dangerous consequences likewise becomes more reasonable. Carson must develop this argument because however tragic the acute cases of pesticide poisoning she cites, they were relatively rare and often linked to what even at the time would have been considered flagrant misuse.

When nature comes to be seen as a seamless web and a delicate balance, human activity is more easily painted as the violation or destruction of that balance. This situation becomes a powerful source of the expansion of the notion of "environment." Instead of a variety of potentially distinct man/nature relationships, each to be judged on its own merits, all interactions come to be viewed in light of the manifold impacts of the most intrusive and disruptive. Thus diverse situations come to be simplified into one "environmental crisis." Looking at the destruction we have shown ourselves capable of causing, it becomes hard to see how human beings "fit" into nature; some wonder whether Carson has created an ideal of nature in which human beings have no place.[43]

Yet this notion of a fragile natural balance precariously perched on the edge of disaster is precisely the one that has least ecological support. To her credit, it is not even Carson's final word on the topic, however much the emotional force of some of her arguments depends on it. For she also likens

the present interaction between man and nature to the "rumblings of an avalanche."[44] While this image retains the idea that small beginnings can have disastrous and unstoppable consequences, it makes human interventions seems less "unnatural." We are not the only cause of avalanches. Furthermore, nature recovers from avalanches; they are an ongoing aspect of ecosystem change.

Thus, despite her sometime use of static imagery, at other times, Carson recognizes that if we are to speak of a "balance" at all, it is better understood in dynamic terms. "The balance of nature is not a status quo; it is fluid, ever shifting, in a constant state of adjustment. Man, too, is part of this balance."[45] Over time, changes, even vast changes, are normal. Species and habitats disappear. Life adjusts to hostile or dangerous situations, and takes advantage of favorable conditions.[46]

Might it not be argued, then, that human beings, as participants in this ongoing, dynamic balance, are simply promoting the same kind of changes which are always going on in nature? Why any special concern about our modifications? Carson tries to explain the peculiar danger human actions pose even to the dynamic balance of nature. Human-induced changes, she argues, work much faster than nature normally works on its own.[47] Such speedy changes mean that ecosystems may not have time to adjust, and that, in turn, raises the specter of a domino-like collapse of the system as a whole.

This argument from collapse due to rapid change has proven increasingly popular. It is a staple of those concerned about the greenhouse effect. They admit that life on earth has flourished during periods even warmer than those projected. But if we were to make a transition to such a warmer world in a mere hundred years, as opposed to hundreds of thousands, there would be no chance for various biota to adjust to the change.

Still, we know that natural ecosystems can undergo vast and rapid changes due to things like volcanoes, earthquakes, fires, floods, and hurricanes, any of which can produce destruction on a scale that dwarfs just about anything humans can do at any speed. Recent reports suggest that even climate can change far more rapidly than anyone had previously thought, although the meaning of the ice-core studies that draw this conclusion is not as clear as newspapers make out.[48] The crucial question is, is the effect even of such great changes amplified over time and through space, as the avalanche metaphor suggests? Or does nature tend to dampen the effects of such disturbances? Will the system collapse from even a minor perturbation, or can major changes be absorbed while life flourishes?

Carson is well aware that the avalanche simile is not entirely appropriate for what human beings are doing to nature. In yet another instance, she likens the consequences of our actions to "ripples when a pebble is dropped into a still pond."[49] Nature is hardly a still pond, but even so, this likeness reminds us that ripples, even as they widen, have less and less impact on the pond. What may be a tidal wave to the water strider next to the pebble's point of impact is hardly felt by the tadpole near shore. The sudden collapse of the eco-system surrounding Mt. St. Helen's did not cause the fall of surrounding and dependent systems, in turn spreading out an avalanche of destruction.

Is there reason to believe that the way humans interact with nature will weaken nature's ability to dampen the impact of our changes? Carson believes so, despite her use of the pebble metaphor. "Nature has introduced great variety into the landscape, but man has displayed a passion for simplifying it."[50] Carson associates what has come to be called "biodiversity" with stability. The consequences of human induced changes become more rather than

less severe over time if the result of those changes is to destabilize ecosystems by simplifying them.

Now Carson must be aware that human activity can also create richer and more complex ecosystems.[51] However, as plausible as the association of diversity and stability might seem, within the discipline of ecology it is not taken as a matter of course; indeed, it is probably safer to say that it is almost completely discredited.[52] If diversity uniformly bred stability, it would be hard to understand how tropical rain forests, widely regarded as the greatest reservoirs of biological diversity, would be as fragile as they are said to be.

So then what remains of the "balance of nature?" Carson herself cannot give a coherent meaning to the concept, and the various accounts she provides are less than adequate descriptions of how nature behaves overall. What we come away with, however, is the sense of a--largely spurious--unity among natural phenomena that clearly points in the direction of the comprehensive rubric of the environment. That connection is formalized by Barry Commoner's famous "laws of ecology."

Commoner recognizes clearly the limits of science's ability to define environmental problems; nevertheless, the "laws of ecology" are presented with a strong normative cast. Commoner, unlike some who cite these laws, at least admits that they are "informal," and not like the laws of physics, perhaps <u>because</u> of the normative content he imbues them with.[53] Unfortunately, he does not specify in what sense they deserve to be called laws at all; and certainly not all ecologists find them satisfactory.

Commoner's first law--"everything is connected to everything else"--is surely the hallmark of what it means to think about "the environment," and obviously requires the most inclusive possible definition of environmental problems. To establish this interconnectedness as completely as possible,

Commoner is thoroughly egalitarian; one finds no hint that connections can be closer or more tenuous, that some parts may be more important than others. As a result, more explicitly than Carson, Commoner argues that this law means that ecosystems act like amplifiers, so that small changes can produce "large, distant, long-delayed effects."[54] Yet in the very same discussion he suggests that unless they are "overstressed" ecosystems tend towards stability.[155] Surely for most ecosystems a "small perturbation" is not enough to overstress it, therefore we might think that most impacts are likely to be dampened, not amplified. But human actions are once again presented as unnatural in their speed and tendency towards simplification, so that what we do is more likely to be amplified than not.

Thus, Commoner wants the reader to come away with the impression that any human induced change is likely to be for the worst: his third law is that "nature knows best." He explains it by arguing that through billions of years of "R & D" (i.e. evolutionary change) nature has come up with an arrangement that is "'best' in the sense that it has been so heavily screened for disadvantageous components that any new one is likely to be worse than the present ones."[56] He likens nature to a watch, and our present interventions in it, to the extent that we lack proper knowledge, to poking a pencil into the works. We are not likely to improve the watch thereby.[57] Here again, the metaphor points us to a comprehensive view that discourages discrimination; Commoner blurs any differences between, say, poking the balance wheel of the watch or poking a main gear--or between poking the watch with a pencil and hitting it with a hammer. We are back to the notion of a static, human-excluding balance that Carson used so effectively, even as she denied its truth.[58]

Commoner carries this view to the point of incoherence in his long-standing concern with the supposed problems caused by declining availability of "nonrenewable" mineral resources and the use of non-renewable energy sources.[59] Yet if his second law is true--"everything must go somewhere"--then no material resource can be "used up." What "somewhere" is "outside" of the environment if everything is connected to everything else? Commoner admits as much; the problem, he says, is actually that metallic resources will be scattered, and can only be recovered and concentrated by the use of energy, which is itself a limited resource, in order to make them useful again.[60] Never mind that human activities can concentrate metallic resources, which is what makes things like aluminum and steel recycling as compared to mining economically feasible. Never mind that Commoner admits that metals considered precious are readily recovered, suggesting that any metal could be readily recycled if market conditions were favorable.[61] Never mind that solar energy is renewable, hence overcoming the problem of the supposed limit on energy available to recycle mineral resources. Never mind that it is Commoner himself who wants to see more extensive materials recycling.[62] Everything must go somewhere, except we are running out of metallic resources.

Finally, the last and best of Commoner's four laws, "there is no such thing as a free lunch" is the one he takes least seriously. He is very good at using it against the pretensions of those who would defend the present constellation of politics, technology and economics. But when he comes to presenting his own recommendations, he is nearly silent on any possible costs that will be associated with his suggested gains. Commoner leaves it to others to argue the costs of "going solar," or of recycling sewage into the soil.

While the four laws point clearly in the direction of thinking about our relationship with nature in terms of "the environment," they do not add up to a picture of the world any more scientifically correct or conceptually

consistent than Carson's less formal presentation of similar ideas. Laws that are not themselves rigorous could hardly produce analyses that are rigorous, how ever much Commoner relies on the rhetorical impact on impressionable types (like law professors) of bringing "laws" of ecology to the fore.

If, then, the science of ecology is not the normative "mother load" that environmentalism seeks, then all of the stock answers to the question of how environmentalism avoids being "everythingism" explain far less than one might think. Our look at what cannot be concluded simply from ecology, "common sense," or particular scientific findings suggests that we must take seriously what the label for the reform movement of our era is telling us: ours is the age in which we are attempting to solve the everything problem. This admission, however absurd it makes the effort sound, in fact helps explain a great deal about the character of the environmental movement.

Environmentalism bears some striking resemblances to the temperance movement; it is obvious it wants to save the environment, but remarks like Caldwell's reference to our "mind and spirit" show how quickly that becomes a desire to save ourselves, a desire which can be pursued with evangelical fervor. But one difference is noteworthy for our purposes. The temperance movement expected vast social reform would occur based on a change in one kind of behavior. Environmentalism expects vast reforms based on changes in many kinds of behavior. In this respect, it is obviously the more "realistic" of the two movements, but its energies are therefore directed into a bewildering variety of paths. The comprehensiveness of the project is often presented as a strength, as if environmentalism were going to be the reform to end all reforms. But one wonders whether the very open-endedness of the project might not help account for the fact that environmentalism has achieved only a

"passive consensus" in American politics; support for it is widespread, but not very intense.[63] People know more or less what to say when asked about environmental issues by pollsters, but not what to do when faced with choices in their lives.

That there is a certain irony in environmentalism's achievement of this status is indicated by another comparison with the prohibitionists. Temperance advocates could only threaten individual damnation, family destruction, or at (worldly) worst social decay if their message were not heeded. With such evils in view, a constitutional amendment looks like a reasonable policy option. On the other hand, the all or nothing logic of the environment has made the price of failing to change our ways nothing less than the destruction--perhaps imminent--of human life--perhaps most life--on earth. The scope of the means necessary to avoid <u>this</u> evil must be made to match the scope and urgency of the end. Thus, while the general public knows only enough to pay lip service to environmental causes, environmentalist activists and popularizers are busy thinking up global schemes of economic and political control, sweeping revisions of value structures, vast increases in the powers of government.

Yet addressing perceived problems from the assumption that they are all interconnected and that dealing with them is potentially a matter of life and death is, to say the least, going to be difficult and frustrating. It would hardly be surprising if, having set ourselves this extraordinary problem, we should have difficulty doing anything about it. Unless we acknowledge just how wrong headed our initial assumptions are, we might well grow contemptuous of our own efforts, come to believe that only stupidity or venality stand in the way of success, and therefore be tempted to think that the whole show would be better off without us. Absent a sense that there is or may be some distinctive place for humanity within a larger whole, the

actions of humans within the environment will seem incomprehensibly different from, and dangerous to, everything else. As a result, policies and programs that mark us off from the environment will tend to look very attractive.

Or, we can be as easily led to the other extreme, and attempt to "manage" the environment, seeking enough knowledge, power and control to deal with everything at once. "We are as gods and might as well get good at it," as the Whole Earth Catalog pronounced. Thinking in terms of "the environment" invites us to multiply endlessly the arenas for the exercise of our powers, and thereby encourages dissatisfaction with whatever we have accomplished.

Examples abound of each these tendencies that can arise from defining problems in terms of "the environment." The misanthropy of deep ecology is frequently commented on, based on statements like that which appeared in an Earth First! newsletter expressing hope that AIDS might be the plague that would clear off excess human population.[64] But aside from such crude sentiments, there is a deeper and more systemic hope for the end of humanity expressed in apparently more benign arguments. Thus, for example, we have William Devall writing:

> Perhaps Sasquatch does exist--as an ideal. Perhaps Sasquatch represents a more mature kind of human, a future primal being. Understood in this way, Sasquatch has a fully realized ecological self. While we, who are children of technocratic civilization, must bring cumbersome technology into the forest to provide shelter and to satisfy our other needs and desires, Sasquatch dwells freely in the forest unencumbered by the burden of complex and complicated technology.
>
> While we are torn with desire for more power over other people and domination over nature, Sasquatch dwells peacefully and unobtrusively with other creatures of the forest. While we are dependent on huge bureaucracies such as schools, governments and military agencies, Sasquatch is independent and autonomous and fully integrated with the forest.[65]

As Bob Pepperman Taylor has dryly noted, a project to transform mankind into homo sasquatch is "obviously not an auspicious position from which to

evaluate the nature of human society and political life."[66] And yet this ideal expresses consistently the results of deep ecology's critique of the modern world. Aristotle noted long ago that it was the human capacity for speech and reason, logos, that made it possible for humans to be either the best or worst of animals. With post-Aristotelian history in mind, the deep ecologists have plainly decided that on balance it acts for the worst. Classical and modern rationalism come under sustained attack, while we are exhorted to cultivate a capacity for experience unmediated by thought or reflection. In effect, we are being told to emulate the way in which other animals live in the world. "Sasquatch is alert to the moment, attuned to sounds, feelings, changes in the forest, while we show our insensitivity to the moment when we ride our motorized vehicles or jog plugged into our Walkmans."[67] Can it be doubted that a squirrel burying a nut is alive to all the nuances of his surroundings, totally immersed in the experience, and living so much for the moment that he probably will not remember where the nut is buried?

The deep ecology programs of bioregionalization (where ways of life are to reflect constraints of location) and ritualization (in which human beings invent a reenchanted nature) may appear to stand in tension with these "animalizing" tendencies, as they involve distinctly human capacities for organization, activity and thought. But the more we imagine the ultimate success of these programs, the more a likeness to unreflective animal existence appears. The peaceful coexistence that vastly different bioregions are supposed to maintain makes some sense if we imagine a variety of post-human species that live such distinct lives as to make interaction between them decreasingly likely or meaningful. Grizzlies don't try to muscle in on polar bear territory. Likewise, a powerful ritual becomes "second nature"; one can hardly conceive of not doing it. From there it is a smaller step to the dance of bees, the song of whales, or the mating ritual of penguins.

This same tendency to remove human beings from the environment shows itself in a different way in one of deep ecology's most interesting critics, Bernard Lewis. Lewis argues cogently that the deep ecology desire to recreate a "primal" world would not necessarily be any better for nature than the impacts we have on it with our present technological infrastructure.[68] His answer to this dilemma is the accelerated development of that infrastructure, with the expectation that it will allow human beings to be progressively more "de-coupled" from nature in meeting the needs that now produce unwanted environmental impact. In this respect, he has particular hopes for nano-technology, for its ability to manipulate matter at the molecular level.[69]

It is hard not to think of the various versions of Star Trek in this connection, e.g. the "replicators" which presumably build up food and supplies atom by atom, not because what Lewis proposes is mere fantasy, but because these shows are sustained efforts to consider what it would mean for human beings to overcome the "realm of necessity" in the way Lewis advocates. In order that there be any "drama" at all under such circumstances--that is, in order for there to be life that is recognizably human--those who inhabit this future must constantly be imposing restraints <u>on</u> <u>themselves</u> to substitute for their freedom from all natural constraint. Hence exploration is always pressed outward, guaranteeing that eventually one will come up against new hostile aliens, thus requiring military discipline. Or, more obviously, there is the Prime Directive, admonishing non-interference in the lives of other worlds. These constraints give the lives of members of Star Fleet meaning under circumstances where otherwise they could have anything they want. (Thus, the Star Fleet elite has no understanding of relations of mutual dependence such as trade and commerce, and there are no long term erotic attachments. The

only character who seemed to have a happy married life had to be seconded to the more primitive and atypical conditions of Deep Space Nine.) But what about everybody else? It is striking how often civilian characters are bad guys; vain, petty, self-absorbed, i.e. just what you would expect of people who are de-coupled from natural or any other constraint. Of course, these are typical stereotypes about civilians held by military organizations, but in Star Trek we see writ large the contempt of those who in some way confront necessity for those who do not.

The tendency towards intensive "environmental management" is perhaps the one that is more pronounced in mainstream thinking about the environment. Indeed, the idea of Managing Planet Earth is sufficiently prosaic that Scientific American could choose it as the title for one of their collections of essays.[70] This management is to be "adaptive" in character, i.e. it must do what we want it to do even in the face of incomplete information. Its goal is "sustainable development."[71] "In essence, sustainable development is a process of change in which the exploitation of resources, the direction of investments, the orientation of technological development, and institutional change are all in harmony and enhance both current and future potential to meet human needs and aspirations."[72] While it is hard to know just what a statement like this means, the importance of bringing everything into harmony seems to be central to what "sustainable" adds to "development," since development is always a process of change in various areas that aims to meet present and future human needs and aspirations.

So we are to achieve for Planet Earth a harmonious and unified managerial capacity that would be the envy of anyone who has ever had to run a five-person office, let alone a large corporation. While those who articulate goals such as these often have experience with large bureaucracies and organizations, it seems impossible to believe that what we are seeing is not

the triumph of hope over those experiences.

The managerial impulse is nevertheless a powerful one. Edward O. Wilson, for example, wants us to catalog all species on Earth[73]--a task that may well rival the human genome project in scope and complexity, since at least strands of DNA stay still and do not hide. What are we to do with such information, once we have it, except start to reach some mutual accommodation with all the life forms we identify? Arne Naess, the founder of deep ecology, has hinted at one consequence of such thinking, showing that even deep ecology is not immune from this temptation to take over and run things right. In a passage explaining how ideally we should look at the environment, he notes that we

> . . .see a lonely, desperately hungry wolf attacking an elk, wounding it mortally but being incapable of killing it. The elk dies after protracted, severe pains, while the wolf dies slowly of hunger. Impossible not to identify with and somehow feel the pains of both! But the nature of the conditions of life at least in our time are such that nothing can be done about the 'cruel' fate of both. The general situation elicits sorrow and the search for means to interfere with natural processes on behalf of any being in a state of panic and desperation, protracted pains, severe suppression or abject slavery. But this attitude implies that we deplore much that actually goes on in nature, that we deplore much that seems essential to life on Earth.[74]

The sentiment Naess describes will surely be familiar to many; what is remarkable is not the sentiment but what he makes of it. When he says that "at least in our time" nothing can be done about the situation of the wolf and the elk, there is an implication that perhaps there will come a time when something <u>can</u> be done. Naess may or may not believe the fate of these animals cruel, but he is ready to discuss what might be done in the way of improving on nature. These changes go well beyond anything ever imagined by Francis Bacon, the arch-enemy of deep ecology for his advocacy of the conquest of nature. He thought merely that such control of nature could benefit human beings. In this passage Naess imagines a project that would extend comfortable self-preservation to all beings. Is what he is saying here so

very different from what Dixy Lee Ray--conventionally regarded as at the opposite end of the spectrum from Naess--says when she advises us that we use our knowledge and understanding to "better the lot of all species on the planet"?[75]

The goals that result from "everythingism"--either a complete remaking of human beings or a complete remaking of the earth--suggest why the reforms environmentalists call for are so often self-consciously radical, i.e. require a thorough reconstruction of politics, economics and society. But it also becomes clearer why the reforms so often point in a direction that is at best utopian and at all-too-frequent worst totalitarian.

While it is now a well accepted proposition that it is indeed a political vision that is the root of the environmental movement,[76] the charge of totalitarianism, I recognize, will be more than troublesome to many, and I do not intend it as a description of all environmental thought. But a troubling tendency in this direction, particularly among the popular authors of the movement, has long been recognized. Writing shortly after the first Earth Day in 1970, Richard John Neuhaus noted that

> . . .as much as we may credit the humane sensitivities and democratic convictions of its authors, the totalitarian bias of much ecological literature is inescapable. The essential idea that society should be reorganized around a "single guiding concept" reveals a totalist approach to social structure. All demurrers to the contrary, this assumption is the cornerstone of ideological opposition to the pluralism that most Americans who have thought about the matter claim to cherish. The call for an embracing "coherence" that can overcome chaotically threatening fragmentation has marked all integralist and authoritarian political movements. . . [T]he demand for social coherence suggests an ideological rigidity and political centralism that is, I believe, foreign to the American social experiment at its best. . .
>
> When the call for coherence is joined to the single guiding concept of survival, the implications are particularly grave.[77]

Even authors much more sympathetic than Neuhaus to the essentials of the environmental program are not blind to the totalitarian implications of at

least those branches of environmental thought with which they disagree. For example, Robert Paehlke realizes that the population limitation programs of Paul Ehrlich and Garrett Hardin would require a government capable of reaching "into every bedroom on the planet."[78]

It is not my purpose here to develop this aspect of the environmental perspective at length, since I have presented such arguments in detail elsewhere.[79] But once again, it is useful to step back and see that defining "environment" in the open-ended way we do has consequences for how we think we need to deal with environmental problems. For the environment is the totality. If we presume to deal with it as such, how can we be anything but totalitarian? Such an outlook explains why, when Friends of the Earth wanted to make a devastating critique of the Rio Summit, they pronounced it no less than "a failure to set a new direction for life on earth."[80] That such remarks pass muster as analysis serious enough to quote is a tribute to the pervasive effect that environmentalism has had on our thinking. Indeed, it could be said that FOE did nothing but hold the Rio Summit to the standard of its own rhetoric.

Where does one start to set a whole new direction for life on Earth? Is it enough to take the bus to work? To recycle? To use cotton diapers? To vote Democrat? In the unreformed world we presently live in, individual choices and policy making alike involve the creation of priorities. It is the open-ended rubric of "the environment" that makes such decisions appear, as they often do, arbitrary. Why make heroic efforts to save the California condor when "the environment" is filled with other endangered species? Why be satisifed with present regulations of airborne particulates, when finer measures and more sopisticated analysis can reveal they allow continued threats to our health and well being? If we think of the world in the way Carson and Commoner have taught us to think--everything is connected to

everything else--then these questions have no good answers, and the door is left open for a cynical intuition that it's all merely partisan politics. The presumptive unity of a fragile environment makes even the most reasonable tradeoff look like an arbitrary decision about which card to remove from a house of cards.

The last refuge for the legitimacy of the environmental perspective is the threat of global destruction. There have always been vast scientific uncertainties in the various, and sometimes mutually contradictory, end-of-the-world scenarios that have been popular over the past 30 years. What is far more certain is that creating the perception that the whole earth is under the gun, that everything is a stake, is a ready excuse for the worst kinds of political extremism. Short of either terrible consummation, we prepare the way for defeat, despair and cynicism as we are forced by our own definition to confront an impossible problem. We increase the sense of individual powerlessness, when only a moment's thought is needed to realize that my action---for better or worse--is unlikely to be meaningful on a global level, the recent vogue for the creation of an environmental calendar of saints notwithstanding.

There is no law that says we must conceptualize our relationship with the world around us in terms of "the environment." However useful the term has been to justify schemes of radical reform, the very speed with which "environment" has taken over our thinking may, with a measure of optimism, be viewed as indicative of a certain evanescence. Certainly there is even less excuse now than there might have been in the 1960s and 1970s for not being wary of political programs that promise to set a new direction for life on earth. But are alternatives readily available?

How to think in terms other than that of "environmental concern" seems to have been in Rene Dubos' mind in his later work. Best known for the much misunderstood phrase "think globally but act locally," Dubos was a major figure in the development of contemporary environmentalism. He started his most public career as a vocal critic of the hope that we could or should seek to eradicate disease[81], and later argued that modern technology was creating a world in which human beings were not biologically programmed to live.[82] In 1972 he wrote, with Barbara Ward, Only One Earth: The Care and Maintenance of a Small Planet.[83] Commissioned by the United Nations, the book set much of the ongoing agenda for official UN environmental action, with its condemnation of industrialization and the market, its suspicion of the West, and its calls for redistributionist policies.

Yet having become a mainstay of many such international efforts, Dubos was for a time disenchanted with them. He came to see them as "a waste of time," because they produced only vague and high sounding statements to cover partisan and ideological disputes among various UN factions.[84] Even that position needed subsequent revision. International conferences could be object lessons, he came to think, not just in common problems, but in the diversity of human situations and institutions. Hence they could demonstrate the danger of "globalization," a dangerous trend towards uniformity imposed from above. Dubos became less and less patient with those who proposed grand schemes of reform that could be applied everywhere.[85]

Obviously, thinking in terms of "the environment" fits perfectly with globalization, and it should be no surprise that Dubos found the term highly unsatisfactory:

> The word environment does not convey the quality of the relationships that humankind can ideally establish with the Earth. Its widespread use points in fact to the present poverty of those relationships. In common parlance, as well as etymologically, the environment consists of things around us, out there, that act on us

> and on which we act. Whether good or bad, the physical components of our surroundings are foreign to us and we are foreign to them.[86]
>
> We expect more of the environment in which we live, however, than conditions suitable for our health, resources to run the economic machine, and whatever is meant by good ecological conditions. We want to experience the sensory, emotional, and spiritual satisfactions that can be obtained only from an intimate interplay, indeed from an identification with the places in which we live. This interplay and identification generate the spirit of place. The environment acquires the attributes of a <u>place</u> through the fusion of the natural and the human order. All human beings have approximately the same fundamental needs for biologic and economic welfare, but the many different expressions of humanness can be satisfied only in particular places.

As we have seen, the concept of "environment" has come to include just about everything Dubos speaks of here <u>except</u> the particularism of place, i.e. precisely the necessary corrective to its overblown sensibility. At times, deep ecology comes close to a like insight. Poet Gary Snyder rightly bemoans the the way in which so many people no longer seem to be from any place in particular, and writes eloquently and plausibly about the importance of a sense of place for a child's education, and for subsequent healthy adult growth.[87] In a telling critique of much environmental sentiment, he notes that it is not enough to want to "'love nature' or. . .'be in harmony with Gaia'." One must be grounded in serious knowledge of that bit of nature which is local and immediate--knowledge that we have even forgotten that we lack.[88] At first glance, bioregions seem to respond to this missing element. But the corresponding search for the most "primal" relatedness to the earth, along with the attempt to create new rituals or adopt old ones to express that relatedness prove to be distractions that lead us from the places we actually inhabit. Snyder admits that one must "indulge in a bit of woo-woo" to call sacred some of these newly created sacred places;[89] nevertheless, the deep ecologists delight in traveling the world over literally and in literature, to pick out the values and rituals that will define their new autochthony.

Over against this mythic quest, one finds in Dubos a poetic and homey sensibility about the myriad combinations of human and natural relationships that make up real and present forms of the local, without the pretense of searching for some primal ideal. He is entranced at how "natural" landscapes inform and are informed by the many ways of life that human beings pursue, as in the distinctive looks of the French or English countrysides.[90] Indeed, he delights in pointing out, most of what we experience as nature is really a result of nature and humanity working together. Yellowstone is a national park because of the rail barons, the last old growth forest in Europe is a remnant of aristocratic privilege, the stark beauty of Greek landscapes is a result of deforestation and erosion, the American Great Plains may exist because of the hunting fires of Native Americans, and many of our wildflowers are here only because of "European imperialism."

Dubos admits to having caused some consternation on college campuses in the late 1970s when he drew out the consequences of this perspective. "Faculty as well as students were surprised and somewhat annoyed when I suggested that, instead of being exclusively concerned with the nation or the world as a whole, they should first consider more local situations." What sort of local situations did Dubos have in mind? He mentions not only local fields and streams, but also "the messiness of public rooms on their campus and the disorder of their social relationships."[91] Little wonder an "environmentally concerned" audience would be annoyed; who wants to hear it's time to clean up his room?

"Think globally, act locally" is Dubos' attempt to encapsulate his thinking on globalization, diversity and localism. While it has been taken to mean we should do our part at home to solve the world's environmental problems--101 things to do to save the earth--that mistakes Dubos' intention.

If "global thinking" is to avoid globalization, it must appreciate the widely differing ways in which human beings interact with the world around them in order to address common needs like food supply, clean water, pleasant surroundings, decent behavior. It would therefore be foolish to define our fundamental relationship with nature in terms of "global challenges."[92]

That global thinking is for Dubos precisely not a call to global action casts the proper light on what we might reasonably expect from the local action he commends. We are capable of finding enough problems in that part of nature which is our own figurative (or even literal) backyard to keep us busy for many years to come, if we no longer have the excuse of looking far away in order to complain about how somebody else is making life difficult for us. If many people take this route, so much the better; if fewer, then at least some corners will be more pleasant and livable.[93]

For those who are convinced, or hopeful, that our civilization is on the eve of destruction, such a course will sound like putting one's head in the sand. But perhaps that some catastrophe of nature might bring all we do to nothing is simply an unlikely, yet not impossible, fact of life. Even if that is true, to make it the starting point of all our thinking provides too easy an excuse for doing nothing or doing far too much. Metaphorically speaking, for fear of being hit by a meteorite I could refuse to mow my lawn at all, or I could hold out until the government sets up a satisfactory space shield. Or I could do my job, and mow my lawn.

All the talk about problems of unprecedented scope, all the fearful celebrations of our power, all the handwringing about the death of nature are distractions from the day to day situations and problems of people all over the world. If we do not allow ourselves to be misled by the totality of the environment, and if we do not give in to utopian hopes for a perfect world, we see that what face us are the same fundamental questions and aspirations of

human life that have always faced us. Messy rooms and messy social lives are hardly new. The human characteristics that are the sources of our fears and our hopes about what we are doing with nature--our greed or altruism, our domination or care, in short, our vices and our virtues--were not born with, or first recognized by, the environmental movement. Neither was the question of how, in the face of these characteristics, we are to have a good life a new question when Rachel Carson came along.

That this question of a good life need not be the starting point for mindless anthropocentrism becomes evident if we simply recall the extent to which thinking about it has long been closely linked to concepts of "nature." Is it simply coincidence that the concept of "environment" was on the rise during the 19th century, i.e. in the same period that sent "nature" into its conceptual decline? Be that as it may, it is true that "nature" too is much used, and abused, and can suffer from the same comprehensive vagueness as "the environment." "Love of nature" no less than "environmental concern" can become an excuse for not paying the degree of attention to particulars that is appropriate.

Yet nature has the advantage over environment at least in being a term that can be abused not because it refuses to discriminate, but because it holds a long, rich and even conflicting set of distinctions and meanings. More to the point, it is a word that has long been closely bound up with our thinking about ethics and politics. As much as we may use it thoughtlessly, "nature" stands ready to open doors that remain closed to "environment." Even a superficial comparison between mainstream environmental popularization and the American tradition of nature writing as evidenced, e.g., in the work of Thoreau, Leopold, the early Carson, Edwin Way Teale, or Roy Bedichek confirms

that "naturalism" is likely to be superior to "environmentalism" in its ability to focus our attention on human questions, and what is near to us.

A reflection on that great icon of the environmental movement, the "whole earth" pictures taken from outer space, provides a way to summarize my argument. One such picture appears on the cover of Al Gore's bestselling Earth in the Balance. The choice is appropriate, as it is precisely Gore's argument (contra Dubos) that we need to shift our environmental attention away from local pollution problems to global or strategic threats like ozone depletion and global warming. He repeatedly, and at times with great moral obtuseness, uses examples drawn from World War II to justify the need for, and possibility of, the kind of unified and concerted global effort he wishes to see begun.[94]

But however moving, these pictures of Earth conform to the defects of the "environmental" rubric in two noteworthy ways. In terms of how they present nature, they exacerbate a problem described nicely by Bedichek:

> Airplane travel obliterates intimate views of the planetary scene and spreads out before the downward-looking eye an unrealistic surface from which everything except the huger features of nature are eliminated. London from a great height on a clear day looks like insect mold of some sort strung along the valley of the Thames. Nature becomes impersonal.[95]

On the one hand, such a view, and the impersonality it provides, encourages the delusion that the globe is "manageable," after all, it is "so small" in the "vastness" of space. Furthermore, it is convenient that certain things like national boundaries are invisible. The world appears as a great and complex inkblot, encouraging the most free ranging imagination for how we would like it to be.

On the other hand, the difference between the view from an airplane and the planetary view from space is that human things no longer even appear as insect mold--they do not appear at all. The "whole earth" image celebrates a

planet from which human life is entirely absent. All that touches us on a daily basis, the world we really live in, is missing. It is, as is appropriate to a view from outer space, an entirely alien vision. It is a view that defining our relationship with nature and ourselves in terms of "the environment" has prepared us to love.

[27]Compare David E. Cooper, "The Idea of Environment," in David E. Cooper and Joy A. Palmer, eds., The Environment in Question (London: Routledge, 1992): 165-180. This essay is an extremely thoughtful argument along the lines of the one presented here, although with a narrower focus. It is directed particularly against those who call for a "'new' environmental ethic" (Ibid., 165). "Put crudely, their notion of environment is of something much too big" (Ibid., 167). Cooper regards this usage, which he calls "The Environment" as a departure from an earlier employment of the term, which was limited to "something for a creature, a field of meanings or significance" (Ibid., 169). "New" ethics that ask us to feel oneness with or reverence for The Environment are incoherent because they attempt to extend such sentiments into a realm where they are inappropriate, and because The Environment is a result of the very scientific thinking the new ethics so often rail against. Like the present argument, Cooper doubts that any new environmental ethic is necessary and suggests that people would best focus on what is close to them if they care about their relationship to the environment.

A crucial flaw mars this otherwise lovely essay. In commending a concept of the environment as field of significance, and in turning however briefly to Martin Heidegger to bolster that case, Cooper neglects the lesson Heidegger teaches that such fields are not given to human beings once and for all. For Heidegger, it is only too likely that, in Cooper's terms, we will come to understand our field of significance as The Environment, however destructive that might be to something that is (in ways that remain mysterious) more genuinely human. If that is happening or should happen, then it seems likely that a new ethic would be necessary. Cooper, it seems unwittingly, himself provides evidence for the seductions of such a change as he at one moment (quite rightly) discusses how the concept of sustainable development glosses over the issue of "depriving people of environments which are the setting for the traditional activities in which they are 'at home'" (Ibid., 174) and at the next presents his personal experience of being one day anchored off the coast of Egypt, and the next back in his "personal, homely" realm of pine woods (Ibid., 177).

To put what is essentially the same point another way, Cooper does not pay the attention he should to how often those authors he believes display a proper understanding of environment talk not in the language of environment at all, but about nature.

[36]Ruckelshaus, "Risk, Science and Democracy," 31

[37]Anything like a complete elaboration of this point would require a paper in itself, but a few words of further explanation are in order. There may be ironies or inconsistencies in science's adoption of the fact/value distinction, e.g. the consequent inability to defend the way of life of science on scientific grounds, or the possibility that modern science is grounded in a vision of the human good that can have no rational justification. It may be that what makes a "fact" might be much harder to pin down than a naive reading of the fact/value distinction suggests. Still, the distinction stands as one of the pillars upon which modern science understands itself to rest. There seem to be two ways to respect this constraint, even while challenging it. One can attempt to reconstruct a science that has room for rational judgement of norms within it, or one can allow science to confine itself to facts, however understood, without prejudice to the possibility that rational discussion and judgment of values is possible. The latter, admittedly provisionl, course is the one implicit in the present paper.

[49]Carson, Silent Spring, 127

[50]Ibid., 10

[51]Carson believes that selective use of herbicides to keep large, woody plants away from roadsides is acceptable, while wholesale spraying is wrong because it destroys wildflowers that make the road beautiful. (Ibid., 75, 69-70) But surely Carson knew two things about those roadside wildflowers: most of them are there because the road exists; many wildflowers do best on disturbed ground, which they take over and colonize. And that in turn is true because a great many North American wildflowers are aliens brought from Europe; they do well in disturbed ground because there they have less competition from native species. Finally, left to itself, the roadside would tend to exhibit ecological succession; the larger, woody plants that she is willing to see sprayed would force out many of the wildflowers that do well on open ground. In other words, in defending roadside wildflowers, Carson is defending a diverse "natural" state that is in three ways a result of human intervention: the importation (accidental or otherwise) of the wildflowers, the building of the road, and the maintenance of conditions suitable for wildflower growth.

[52]Mark Sagoff, "Fact and Value in Ecological Science," Environmental Ethics 7(Summer, 1985): 107-110. See also Paul Colinvaux, Why Big Fierce Animals are Rare: An Ecologist's Perspective (Princeton; Princeton University Press, 1978): 123, 209 In general, Colinvaux's book is a highly readable presentation of how a professional ecologist looks at nature, and it is striking how different his view often is from the environmental popularizers who claim to be inspired by ecology. As Colinvaux himself puts it in his Preface: "Ecology is not the science of pollution, nor is it environmental science. Still less is it a science of doom. There is, however, an

overwhelming mass of writings claiming that ecology is all of these things. I wrote this book in some anger to retort to this literature with an account of what one practicing ecologist thinks his subject is really about. . .I take the opportunity to brand as nonsense tales of destroying the atmosphere, killing lakes, and hazarding the world by making it simple" (vii).

[53]Commoner, Closing Circle, 29

[54]Ibid., 35

[55]Ibid.

[56]Ibid., 39

[57]Ibid., 38

[58]Sustained attack on the idea that nature knows best has done little to lessen the popularity of the idea. William Tucker critiques "nature knows best" by comparing it Deism, and accuses Commoner of adopted a kind of "Panglossian philosophy." He presents examples where it is hard to see how natural design has worked for the best (Tucker, Progress and Privilege, 167--168). Rene Dubos offers a similar critique (Rene Dubos, The Wooing of Earth: New Perspectives on Man's Use of Nature (New York: Charles Scribner's Sons, 1980): 80-84). George Claus and Karen Bolander contest the notion that nature produces nothing it cannot recycle by noting that there is no natural enzyme to break down so common a thing as plant pollen and spores (George Claus and Karen Bolander, Ecological Sanity (New York: David McKay Co., 1977): 516-518).

[75]Dixy Lee Ray, Trashing the Planet (New York: HarperCollins, 1990): 171

[76]That there is a political program at the heart of environmentalism, once a charge largely confined to critics, is being ever more widely acknowledged. Bob Pepperman Taylor has a particularly thoughtful way of understanding the implications of the fact that "our political and environmental values are necessarily connected" (Taylor, Our Limits Transgressed, xiii). Langdon Winner has likewise noted perceptively that, "We must learn to read contemporary interpretations of the environment and ecology as we read Hobbes, Locke, or Rousseau on 'the state of nature,' to see exactly what notion of society is being chosen" (Langdon Winner, The Whale and the Reactor: A Search for Limits in an Age of High Technology (Chicago: The University of Chicago Press, 1986): 137). Robert C. Paehlke distinguishes environmentalism from its conservationist forebearer by, among other things, the fact that "from the mid 1960s to the present" the movement has been "largely political and ideological in its perspective" (Robert C. Paehlke, Environmentalism and the Future of Progressive Politics (New Haven: Yale University Press, 1989): 21). See also David Pepper, The Roots of Modern Environmentalism (London: Croom Helm, 1984).

[77]Richard John Neuhaus, In Defense of People: Ecology and the Seduction of Radicalism (New York: The Macmillan Co., 1971): 112-113

[78]Paehlke, Progressive Politics, 58 Paehlke wants to reject the extreme political conclusions drawn from the various arguments on behalf of an environmental crisis, but he seems largely to accept the way environmental problems have been defined, as for example when he accepts the conventional view that Carson "documented in impeccable detail the scientific evidence" against pesticides (Progressive Politics, 28). I am obviously less convinced than he that it is possible reasonably to draw moderate conclusions from the immoderate premises on which environmental problems have come to be defined.

At any rate, it is striking that the only grounds he can suggest for so doing are a certain reading of world politics over the last decades, and a faith in the power of democracy and altruism (Progressive Politics, 75).

[91]Dubos, Celebrations, 83

[92]Al Gore, Earth in the Balance: Ecology and the Human Spirit (New York: Penguin Books, 1993)

[93]Even in his later work there are moments where Dubos cannot rid himself of a managerial approach to nature; as was already suggested, consistency of thought does not seem to have been of first importance to him. Michael Pollan's Second Nature: A Gardener's Education (New York: Dell Publishing, 1991) exhibits a more thoughtful still--+and highly readable--understanding on this point. Pollan points out that the combination of nature and culture is what is meant by "cultivation," a word which far better acknowledges the constraints arising from nature and human nature than "management."

NATIONAL CHARACTER, INTERNATIONAL IMAGE, AND THE CONSTRUCTION OF IDENTITY

Frank Louis Rusciano

Department of Political Science

Rider College

Bosah Ebo

Department of Communications

Rider College

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

Not for quotation or citation without authors' permission.

This paper addresses the issue of the re-emergence of nationalism in the new world order by studying the construction of national identity as a social/psychological process, and as an international negotiation. The essay includes four sections. The first section describes the processes which led to the need for a reassertion of national identity and new means to define it. The second section describes how the national consciousness and international image of a nation become the primary factors in the negotiation of a nation's identity in world forums. The third section presents two pilot studies of these negotiations-- Iraq during Kuwaiti crisis and Germany during the anti-immigrant violence. These studies include analyses of the critical role of political communications in these processes. The final section discusses the relationships between the macro-level political communication involved in the negotiation of national identity, and the micro-level psychic and material needs of citizens served by this negotiation.

NATIONAL CONSCIOUSNESS, INTERNATIONAL IMAGE, AND THE CONSTRUCTION OF IDENTITY

The emergence of a "new world order" is defined, in part, by the concurrence of two preternatural phenomena: the collapse of the Soviet Union and its subsequent loss of control over its satellite states, and the resurgence of nationalism as a basis for conflict within and among nations. To date, the relationship between the two has been articulated only in unconvincing terms, in which nationalism is viewed as a latent syndrome previously suppressed by centralized control from the Soviet government. By this argument, it was inevitable that the full force of nationalism would be unleashed once the center collapsed. While this argument has some validity, it is incomplete for three reasons. This thesis assumes that the resurgence of nationalism can be understood in the same terms as earlier nationalistic movements, and that centralized control only represented an "interruption" in history regarding such movements. It also overestimates the ability of centralized authorities to control nationalistic movements, while ignoring the extent to which Soviet authorities (among others) used nationalism as a means of advancing their own ends (see Greenfeld, 1985)[1]. Finally, it also ignores the role which national feeling may play in the definition and maintenance of nations, and the reasons why this role has become critically important in the wake of the Soviet collapse.

This paper will address the issue of the re-emergence of nationalism in the new world order by studying the construction of national identity as a social/psychological process, and as an international negotiation. What follows is divided into four sections. The first section describes the processes which led to the need for a reassertion of national identity and new means to define it. The second section describes how the national consciousness and international image of a nation become the primary factors in the negotiation of a nation's identity in world forums. The third section presents two pilot studies of these negotiations-- Iraq during the Kuwaiti crisis and Germany during the anti-immigrant violence. The final section discusses the relationship between the macro-level political communication involved in the negotiation of national identity, and the micro-level psychic and material needs of citizens which are served by this negotiation.

[1] Greenfeld, Liah. "Nationalism and Class Struggle: Two Forces or One?" **Survey**. 29. (1985):153-174.

The Need for a New Path to National Identity: The Collapse of the Marxist Developmental Model and the Sources of Ressentiment

The key to understanding the present resurgence of nationalism lies in interpreting this collapse in terms of its effects upon the economic and ideological status of nations in the world. Prior to this event, analysts divided the world into three parts: first world nations (the major industrial countries), second world nations (the Soviet Union and the Warsaw pact nations), and third world nations (the less developed nations of Latin America, Africa, the Middle East, and Asia). This division defined a developmental hierarchy based, in part, upon ideological distinctions. As such, it provided alternative definitions of the notions of "national development" and "national identity."

In liberal economic theory, the stages of development are traditionally divided into pre-industrial, industrial, and post-industrial levels, characterized by such factors as the main occupation of a majority of the workforce and the economic and natural resources available to the nation (Best, et. al., 1986)[2]. However, the nations of the first, second, and third world do not fit easily into this typology: first world nations tend to be both industrial and post-industrial, second world nations tended to be both industrial and pre-industrial, and third world nations tend to be pre-industrial. As such, the second world overlaps with the first and third worlds by this hierarchy of economic development. The reasons for the overlap concern other ideological distinctions which formerly separated first and second world nations, and which provided alternative views of the notion of national development.

Talmon distinguishes between the forms of liberal and totalitarian "democracies" which define the difference between the first and second worlds respectively:

> The essential difference between the two schools of democratic thought as they have evolved is not, as it is often alleged, in the affirmation of the value of liberty by one, and its denial by the other. It is in their different attitudes to politics. The liberal approach assumes politics to be a matter of trial and error, and regards political systems as pragmatic contrivances of human ingenuity and spontaneity. It also recognizes a variety of levels of personal and collective endeavor, which are altogether outside the sphere of politics.
>
> The totalitarian democratic school, on the other hand, is based upon the assumption of a sole and exclusive truth in politics. It may be called political Messianism in the sense that it postulates a pre-ordained, harmonious perfect scheme of things to which men are irresistibly driven, and at which they are bound to arrive. It recognizes ultimately only one plane of existence, the political. It widens the scope of politics to embrace the whole of human existence... Its political ideas... are an integral part of an all-embracing and coherent philosophy (emphases mine)[3].

---

[2]Best, Paul J., Rai, Kul B., and Walsh, David F. **Politics in Three Worlds: An Introduction to Political Science**. (New York: John Wiley and Sons, 1986). pp. 51-52. This typology is commonly accepted by most analysts of development; one can find similar references in a variety of other introductory and advanced texts on the subject.

Liberal theory rests upon the notion that economic activity, and the related measures of growth and development, are objective standards, outside the realm of politics. Marxist theory, by contrast, includes economic activity, and all related measures, within the context of political definition. This conflict delineates the ideological division of nations into first, second, and third world countries. For nations of the first world, material satisfaction was measured in terms of the Gross National Product and the subsequent division of wealth in the society. Accordingly, development related only to the economic status held by the nation according to these standards. For nations of the second world, material satisfaction was a political construct, relating to the satisfaction of desires or goals deemed appropriate by centralized authorities. Within Communist nations, "development" followed Talmon's "Messianistic" notion, as nations were ranked according to their progress towards the ultimate end of historical and material development-- i.e. the Communist society. Third world nations occupied different positions, depending upon the interpretation of first, second, and third world one used. According to liberal theory, third world nations occupied the lowest position in the developmental hierarchy. However, third world nations were also potential battlefields upon which the clash of worldviews was pursued. Here, the West advanced the purely economic interpretation of development, wooing these nations with the promise of greater material wealth and a higher standard of living. The East advanced a Messianistic interpretation of development, wooing these nations with the status of being more advanced historically, if they embraced Communism, than the Western nations[4].

That the clash of these two visions would include national identity was inevitable. As Tamir notes "Aspiring to national self-determination is... bound up with the desire to see the communal space not only as an arena of cooperation for the purpose of securing one's interests, but as a place for expressing one's identity (emphases mine)[5]." National self-determination, or the claiming of a common culture leading to national identity, presents citizens with considerations of economic viability (how does citizenship serve my economic interests?) and personal identity (what status do I derive from being a member of this nation?). Greenfeld argues convincingly that the Marxist critique of nationalism was, in actuality, an assertion of a different form of nationalism:

> In the final analysis, to use of Marx's favourite phrases, Marxism may not be an exception in the age of nationalism, but another expression of this age; and class struggle not an independent phenomenon as characteristic of the modern society as the rise of nationalism, but another face of nationalism[6].

---

[3]Talmon, J. L. **The Origins of Totalitarian Democracy**. (New York: Praeger, 1960). pp. 1-2. Lindblom refers to such systems as "Model II" and "Model I" systems, respectively. (See Lindblom, Charles. **Politics and Markets: The World's Politico-Economic Systems**. (New York: Basic Books, 1978). pp. 250-3.

[4]This is not to say that the Communist nations did not also promise a higher standard of living as part of their appeal; yet, the relative examples of the Eastern and Western standards of living did not make this appeal their primary emphasis.

[5]Tamir, Yael. "The Right to National Self-Determination." **Social Research**. 58 (1991):587.

[6]Greenfeld. "Nationalism and Class Struggle." p. 174.

The two models of development delineated in the description of first, second, and third world countries therefore defined two alternative paths towards national identity. The first defined the nation only in terms of its ranking relative to objective measures, as compared to other nations. The second defined the nation in terms of its place in the paradigm of historical development embraced by the Eastern bloc.

As the appeal of these models changes in the emergence of a new international order, so too does the role which nationalism and national identity plays within the internal and global setting. For national identity has a social aspect with which liberal theorists were never entirely comfortable. An individual's national identity not only describes their location and material position; it also defines their sense of place and status among fellow citizens and those of other nations. Indeed, Greenfeld describes three critical social ends served by national identity: (1) an internal purpose within nations, as national identity lends individuals a sense of "fundamental human worth"[7]; (2) a global purpose regarding the nation's status in the world, as a means of overcoming ressentiment, or humiliation relative to other nations' core values[8]; and (3) a means of controlling one's economic position in the world, particularly for less-developed nations to improve their status by embracing an alternative economic theory which bolsters their international standing[9]. As long as the division of nations rested upon a developmental hierarchy based partly upon ideological conflict, two paths to national identity lay open for countries.

The collapse of the second world portended the rise of nationalism, then, because it removed a fundamental path by which nations could define their status in the world and their stage of economical, social, and political development. The ideological collapse is arguably of equal, or greater, importance than the power collapse which ended the Soviet Union's centralized control over the second world. The power collapse provided the opportunity for the emergence of nationalism in its present form, but the ideological collapse provided its impetus.

From Propaganda War to Negotiated Construct: The Construction of Identity as a Structuring of Social Reality

The preceding analysis begs the question of why more than one path was necessary for nations to define their status in the world-- why nations could not draw status from their position in a single developmental hierarchy. The answer lies in a closer examination of the role of national identity in a person's life. Greenfeld states how "National identity is, fundamentally, a matter of dignity. It gives people reasons to be proud[10]." As such, it is a means of avoiding the condition of ressentiment,

---

[7] Ibid.: 159.

[8] Ibid.: 160.

[9] Ibid.: 173.

which

> refers to a psychological state resulting from suppressed feelings of envy and hatred (existential envy) and the impossibility of satisfying these feelings. The sociological basis for ressentiment-- or the structural conditions that are necessary for the development of this psychological state-- are twofold. The first condition (the structural basis of envy itself) is the fundamental comparability between the subject and the object of envy, and the belief on the part of the subject in the fundamental equality between them, which makes them in principle interchangeable. The second condition is the actual inequality (perceived as not fundamental) of such dimensions that it rules out practical achievement of the theoretically existing equality. The presence of these conditions renders a situation ressentiment-prone irrespective of the temperaments and psychological makeup of the individuals who compose the relevant population. The effect produced by ressentiment is similar to "anomie"[11].

The collapse of the second world, and the resulting loss of one path to national identity, leaves both an assumption of equality and an actual inequality. In contrast to the Cold War era, in which the Western and Eastern blocs often did not recognize (or respect) as legitimate various governments allied with the opposite side, nations in the new world order were supposed to enjoy equal claims to sovereignty. As Obasanjo argues, the new order assumes a "commonly agreed security arrangement taking due cognizance of the principles of respect for the United Nations' Charter, non-aggression, the observance of the rule of law, justice, and respect for the sovereignty of nations (emphases mine)[12]." Yet, is naive not to recognize that the classification of nations into pre-industrial, industrial, and post-industrial necessarily confers upon countries unequal standing in the world. First, there are the clear inequalities in resources and standards of living; as Brzezinski notes, the new global conditions are characterized by "individual and collective expectations rising rapidly, especially as the world's rich want more of everything and the poor desire what the rich already have[13]." Second, there are the related inequalities in the "social value" derived from being among the most developed and powerful nations. The "social value" of national identity lies in its ability to accord pride to their citizens. Within any hierarchy, only those occupying the top positions may derive status, and hence pride, from their position. By this international standard, the status of the most developed nations is defined, in part, by the fact that only a few countries may occupy the highest rankings at any given time. Hirsch refers to this problem as "social crowding", in that the top positions would lose their social value as reasons for national pride if all or most nations were able to achieve these positions[14].

[13] Brzezinski, Zbigniew. "Power and Morality." **World Monitor**. March (1993):24.

[14] Hirsch tends to discuss this problem only within the context of particular societies, but the same argument applies for nations on a global level. Hirsch, Fred. **The Social Limits to Growth**. (Cambridge: Harvard University Press, 1976).

Citizens of less privileged nations therefore find themselves in a status deficient position, or a position of relative status deprivation compared to citizens of other nations, similar to that of individuals in past societies which first prompted the emergence of nationalism:

> In the society of orders, pride and self-respect, as well as the claim to status or the respect of others, was a privilege of the few, a tiny elite placed high above the rest. The lot of the rest was humility and abnegation, which they tried to rationalize or make tolerable in one way or another, and sometimes even managed to enjoy, but could never escape... Nationalism diminished the significance of [these] invidious distinctions, and at the same time, secured everyone from ultimate degradation. Within a nation, status (and with it, sense of pride and self-respect) can never be totally lost[15].

Within the new world order, the scramble for status becomes global rather than societal. Yet, major similarities remain from the first appearances of nationalism. National identity still remains one means by which "invidious distinctions" among the privileged and non-privileged can be alleviated-- but the distinctions now exist among privileged and non-privileged nations, and their respective citizens, rather than among the individuals within nations. As such, the present emergence of nationalism involves the assertion of national identity as a means to claim status in the community of nations outside of the developmental hierarchy as it now exists. This global context makes the expression of nationalism in the new world order different from previous manifestations. Out of the ressentiment produced by a single developmental hierarchy comes a "creative impulse" born of the "psychologically unbearable inconsistency between several aspects of reality"[16]-- an impulse expressed in several nations' renewed, and often aggressive, expressions of their national identity.

It was inevitable that the collapse of the second world would alter the role of political communication in this assertion and establishment of national identity. For political communication is the fundamental venue for the construction of social reality regarding political objects. When the construction of national identity could be construed in terms of an economic hierarchy based upon an ideological conflict, the struggle for identity was predominantly an ideological struggle. As Avineri notes, "The institutions we have had until now, and which will have great difficulties adapting to the new situation, were based on the concept that the West had to be defended, and if possible, things should be helped along to be changed peacefully, rolled back... in the East[17]." When the primary conflict over national identity involved the competition between two notions of development, political communication served mainly as a venue for the propaganda battle between East and West. A variety of (often anomalous) structures resulted as the two sides created borders for nations which served this conflict. Entities which

shared ethnic and historical identities, such as Germany and Korea, were divided; others which shared few discernible characteristics, such as the Soviet Union, Czechoslovakia, Yugoslavia, and many nations in Africa and the Middle East, were combined or created.

Since the end of the Cold War, the elements which go into the structuring of national identity have become bases for conflict. As ressentiment arises among nations due to their standing in the single developmental hierarchy, the tangible and intangible aspects of national identity become issues in the struggle for status. The tangible aspects include the exact borders of the nation and the peoples over whom the government has legitimate authority. The intangible aspects include a shared historical memory, a common cultural heritage, and a common ethnicity. But all of these factors are social constructions[18]. The problem in the new world order, then, is what the basis of "social value", or status, will be in the wake of the ideological collapse of the Marxist alternative and the status deficiencies arising from the single developmental hierarchy.

The two primary factors in the construction of identity in the new world order are national consciousness (here referred to also as "national character", or the citizens' and leaders' perceptions of their country's borders, culture, and ethnic composition) and international image (or the manner in which other nations regard the country's borders, culture, and ethnic composition). Previous analyses of national identity have tended to focus exclusively upon citizens' national consciousness[19]. While such information provides a critical part of the definition of a nation's identity, it does not provide the complete picture. For like individual identity, national identity is defined "in the context of a relationship[20]." Identity consists of the notion one has of oneself, and the recognition of that notion by others. Similarly, national identity consists of the idea a nation has of itself, and the recognition of that idea by other nations. If national identity is to provide a sense of dignity for individual citizens, if it is to have some "social value" to those who claim it, it must command the respect of others. This respect must necessarily arise out of a process by which a country's sense of itself is reconciled with other nations' image of it. Hence, national identity grows out of an interactive process, a negotiation between national character and international image which is conducted in world forums such as the United Nations and the global media outlets.

National character clearly serves the material and psychic needs of the citizens or leaders associated with it. But what defines a nation's international image, and hence, its status? In individual societies, public opinion and reputation define the

[18]Mazrui, Ali A.. **The Africans: A Triple Heritage**. (Boston: Little, Brown, 1986):23-38. Mazrui's commentary on the "social construction" of reality regarding Africa illustrates only one manner in which the third world literature can be a critical resource for the discussion of nationalistic phenomena.

[19]Traditionally, social scientists have used poll results from the nation in question to measure consciousness. For a classic example, see Verba, Sidney and Almond, Gabriel. **The Civic Culture**. (Boston: Little, Brown, 1965).

[20]Gilligan, Carol. **In a Different Voice**. (Cambridge: Harvard University Press, 1992):160.

status of particular objects and the individuals associated with them[21]. In the global community, world opinion and the international reputation of a nation defines the basis for this status and the citizens and leaders associated with it.

World opinion no longer conforms to the structures set by the ideological conflict in the Cold War; a nation does not automatically command status with a significant portion of the world merely by declaring itself Communist or democratic. Instead, world opinion has become a more free-floating phenomenon, whose meaning for each nation must be negotiated. The major variable in a nation's success in asserting its own vision of its national identity is its ability to convince other nations, particularly the major powers, that this vision does not conflict with the norms or interests of the international community. "International image" is therefore primarily determined by the moral and pragmatic components of world opinion regarding a nation's identity. As noted in another paper, the moral component of world opinion deals with "values which relevant nations [are] supposed to share, where issues are discussed in terms of right and wrong behavior", thereby referencing the norms of the world community. The pragmatic component of world opinion deals with "interests which relevant nations were supposed to share, where issues are discussed in terms of practical costs and benefits" to the nations involved, thereby referencing the interests of the world community[22]. Most of the activity concerning world opinion primarily includes leaders (and sometimes citizens) of the various nations involved in the negotiation of a country's identity in various world forums.

This paper describes two pilot studies of the construction of identity in cases where nationalistic claims raised issues of importance to the world community. The first case concerns the Iraqi invasion of Kuwait, which was justified by Saddam Hussein's claim that, historically, Kuwait was a province of Iraq whose borders had been shifted for the convenience of non-Arab powers. The second case concerns a different type of crisis, the anti-immigrant violence which occurred in Germany after unification, and the feared rise of neo-Nazism in the assertion of German nationalism.

At first, these cases may appear incomparable. The first concerns an invasion and raises concerns about the legitimate use of military force, while the second concerns an internal problem within one specific nation. Also, the Iraqi case occurs within the context of a dictatorial regime, in which citizens have little control over the leader's pronouncements regarding national character. The German case occurs in the context of a democratic regime in which national character is strongly influenced by the citizens' attitudes, actions, and interactions with the government. Yet, both crises are directly tied to the reconstruction of national identity and the threat of status deficiency among nations or groups within nations. In both cases, the assertion of nationalism became a justification for violence. In both cases, the state responses were activated with the deliberate intention of

influencing the nation's identity by negotiations regarding its international image. Finally, in both cases the negotiation between these two factors was carried on in a manner which reflected German and Iraqi influence upon the international media and the construction of social reality regarding their respective nations.

The Iraqi Case: Failures in Negotiation

Analyses of international reaction to the Iraqi invasion of Kuwait generally focus upon two obvious affronts to the world community: Hussein's unprovoked military aggression against a relatively defenseless nation, and his subsequent control of a significantly greater proportion of the world's known oil reserves. Hussein attempted to justify the attack on Kuwait by claiming a historical right to sovereignty over that nation, in effect redefining Iraqi national identity by absorbing Kuwait into its borders. It is difficult to judge the extent to which Iraqis accepted this redefinition of their borders; however, there appeared to be a great deal of Iraqi public support for the (initially) successful invasion of Kuwait. Given the dictatorial nature of Hussein's regime and the lack of survey data on citizens' reactions, his actions and statements must serve as the primary measure of Iraqi national consciousness regarding this issue. No doubt the attack on Kuwait was partially motivated by a desire to erase some of the national frustration with the stalemated war with Iran, which lasted eight years and claimed hundreds of thousands of lives. A war of this duration which ends without a clear victory is sufficient to encourage the form of ressentiment described above, particularly since Iraqi military power made it appear one of the most formidable forces in the world.

It is reasonable to assume that the international response to Hussein's attack might have been muted had Hussein been able to generate world public support for his historical claim to sovereignty over Kuwait. His early efforts in the crisis were designed to engender world acceptance of an international image of Iraq which included the new borders. As Hinckley notes "One of Saddam Hussein's stratagems for emerging politically... victorious from the crisis... was to divide and disrupt public opinion of the coalition arrayed against him and to draw the non-aligned and Arab masses to his side[23]." Accordingly, Hussein focused on three potential cleavage lines in world opinion regarding the invasion. First, he aimed a disinformation and propaganda campaign towards the Arab publics, framing the invasion in terms of the religious, economic, and anti-Israeli sentiments these individuals shared with Iraq. Second, he attempted to influence American public opinion against the use of military force by recalling the Vietnam analogy, and emphasizing Iraq's greater willingness to sustain troop losses. Finally, he appealed to the European publics to reject American foreign policy leadership as they had in the past, arguing that the Europeans would support Iraq if they examined the situation closely[24]. The evidence suggests that none of these strategies was

---

successful.

Regarding the first strategy, media analyses from December 1990 suggest that the major newspapers in third-world nations in Asia, Africa, and Latin America questioned American motives in the Gulf. Still, they were almost unanimous in their anti-Hussein sentiment. They also generally supported the United Nations' resolution approving the forceful removal of Iraq from Kuwait, albeit with some complaints that a "double standard" had been applied which was not used in such cases as the American invasion of Panama[25]. The Arab newspapers tended to break along two dimensions in their reactions to crisis: an anti-Hussein/pro-Hussein axis and an anti-American/pro-American axis. However, the anti-Hussein sentiment eventually dominated in most newspapers, except those which represented a strong pro-Iraqi perspective.

In addition, an in-depth study of references to world opinion in the New York Times and the Times of India during the six-month pre-war period revealed that the latter newspaper agreed with the former newspaper's moral condemnation of Iraq, even while it disagreed with the pragmatic judgment that the invasion violated all nations' interests. Indeed, references to world opinion and the international isolation of Iraq converged in timing in the two newspapers after the first eight weeks of the crisis, indicating that a rough consensus emerged regarding the importance of the issue in world opinion during the weeks prior to the Persian Gulf War[26]. This consensus was also reflected in the timing of documents regarding the crisis presented to the United Nations after the first eight weeks following the invasion. World opinion, as expressed in that forum, appeared to follow a similar schedule on the crisis[27]. This emerging consensus eight weeks into the crisis indicates that Hussein failed in his attempt to divide world opinion enough so that Iraq's new claims to sovereignty would be accepted.

Regarding the second strategy, anti-Hussein sentiment was so strong in the United States that it tended to override the fear of war in the American public. An example of Hussein's miscalculation in this aspect of the campaign occurred on August 23, 1990, when he appeared with a group of British children being detained with their parents in Iraq. The appearance was intended as a public relations gesture to the international media; it became a public relations disaster as the image of the frightened children merely intensified revulsion towards the dictator.

Finally, Hussein failed to derive support from the European nations, due to their immediate and almost universal condemnation of the Iraqi invasion. Only three major daily European newspapers out of 50 sampled categorically opposed the use of force to remove Iraq from Kuwait[28].

Hussein's attempt to negotiate a new identity for Iraq which encompassed Kuwait therefore failed to influence the moral or pragmatic components of world opinion. Morally, he could not muster support for the legitimacy of his claim over Kuwait. Pragmatically, he was unable to convince the United States, or the rest of the international community, that it was in their interests to accept tacitly Iraq's new image by not intervening in the conflict. A final factor in this failure was Iraq's lack of influence over the international media. Without credible media outlets within their nation, Iraq was at a disadvantage getting their message across to other nations. Even within its own borders, Iraqis were bombarded with pro-Kuwaiti news messages from outside outlets. This lack of control combined with Hussein's failed attempts at international public relations to doom Iraq's attempt at nationalist claims over Kuwait.

The Case of Germany: A More Successful Negotiation

Perhaps no nation carries with it more negative historical baggage regarding the assertion of national feeling than the German Federal Republic. Both within and outside of this country, assertions of German national pride are always viewed suspiciously through the lens of the Nazi experience. As such, the post-war history of the German nation has been marked, in part, by a search for a "masterable past", an interpretation of the Nazi era which would allow the expression of national consciousness freed from the possibilities of a Nazi revival[29]. For example, during the pre-war Kuwaiti crisis, the Frankfurter Allgemeine Zeitung, a German newspaper of record, contained almost as many references to world opinion on the upcoming German unification as references to world opinion on the Iraqi invasion. (By contrast, neither the New York Times nor the Times of India even mentioned German unification in their references to world opinion durino this period)[30].

It is therefore not surprising that the rise of neo-Nazi violence towards foreigners in Germany after unification would affect citizens' views of their nation, and concern for Germany's international image. Unification was initially greeted with increased optimism by German citizens. These optimistic expectations had faded by the end of 1992, partially due to the anti-immigrant unrest[31]. In this case, the assertion of Germany's national identity in unification had resulted in nightmarish reminders of the

[30] Rusciano. "Media Perspectives on World Opinion During the Kuwaiti Crisis."

Third Reich. The ressentiment described regarding the new status of nations and citizens became especially evident in the former Eastern sectors of the nation, where the anti-immigrant violence was often concentrated. New citizens, aware of their inferior economic position vis-a-vis the former West Germans, often reacted with violent expressions of their "rightful" German identity against foreigners, due to the new citizens' status deprivation.

The German reaction to these potentially harmful expressions of national identity was decidedly different from the Iraqi reaction. For German intellectuals and citizens, the negotiation of their new identity became a matter of central concern, which involved all levels of society, not just the political leadership.

On the elite level, intellectuals joined a campaign to counteract the negative images being broadcast in the media. Several German academics involved in international exchange programs submitted a letter to a German newspaper, condemning the violence and stating that it was atypical of the nation's attitudes towards foreigners. Copies of this letter were circulated to academics in the United States who had participated in foreign exchange programs with German scholars. Poll results which indicated that German tolerance for foreigners, and intolerance for right-wing extremism, were also publicized[32]. This publicity clearly illustrated the full significance of the confrontation between national character and international image in the construction of a nation's identity. It noted how "Pictures and news stories were transmitted to every corner of the globe, creating the impression that a reunited Germany was on its way to becoming a hotbed of a new and dangerous right-wing extremism[33]." The report's authors attempted self-consciously to serve two purposes. They addressed the issue of German national consciousness by claiming to "show that right-wing rioters and hooligans, who until recently believed they were admired or at least tolerated by a silent majority of the German population, were operating under completely false assumptions[34]." They addressed the issue of Germany's international reputation by claiming a desire to "curb the damage inflicted on Germany's image abroad" with the survey results[35]."

German citizens also became involved in the effort to assert a more benevolent view of their national character, both domestically and in the international media. In January 1993, candlelight vigils were held in dozens of major German cities to protest the anti-immigrant violence. Originally conceived by four individuals in Berlin as a means by which "the country's 'silent majority' [could] break its silence and show its repudiation of these attacks", the movement grew to involve over two

[34] Ibid.:5-6.

[35] Ibid.:5-6.

million German citizens, or approximately one in every 40 people in the country[36]. As with the publicity campaigns described above, this movement served two purposes. An organizer claimed that it addressed questions about German national character, as "it [showed] that a majority of Germans are not secretly hostile to foreigners or sympathetic to fascism." As a result, he claimed that "the climate in Germany" had changed regarding citizens' public reactions to the attacks[37]. Another observer stated that these efforts were directed towards an international audience: "Some people go out and hold candles because they want to improve Germany's image in the world[38]."

German government officials were quick to use this publicity to establish a link between the efforts of citizens and opinion leaders, and a drop in anti-immigrant violence in the early part of 1993. On March 17, 1993, Cornelia Schmalz-Jacobsen, the government's advisor on matters dealing with foreigners in Germany, announced that while

> A year ago, even six months ago, it seemed that our society was paralyzed by violence... That has clearly changed. Our society and our political leaders have shown that this violence is something we do not want in our country[39].

Schmalz-Jacobsen then attributed the "change in attitude" in part to the candlelight vigils and to "countless smaller initiatives by individuals and social groups[40]." The Week in Germany, a newsletter published by the German Information Center, echoed the statistics regarding the drop in attacks on foreigners in its March 19, 1993 edition.

All of these efforts illustrate a self-consciousness effort on the part of German citizens, intellectuals, and government officials to identify their national character with anti-fascist and anti-xenophobic sentiments, and to protect Germany's international image after unification. In part because these individuals used their influence over media sources so effectively, through careful public relations efforts, the negotiation appears to have been accomplished primarily in the nation's favor. Even as right-wing attacks increased again in the later months of 1993, analyses speculating about whether a resurgence of German nationalism was to blame did not reappear. Instead, these acts were interpreted as criminal behavior, and treated as such by the international press.

Conclusion

The two cases studied above illustrate the process by which identity is constructed in the new world order. Hussein's efforts represent a failed attempt to overcome the ressentiment associated with a stalemated war with Iran by the forced annexation of Kuwait. This assertion of Iraqi national identity failed because Hussein was incapable of reconciling his image of the new borders of Iraq with the international image of that nation's legitimate boundaries. In the case of Germany, efforts to overcome the ressentiment caused by economic upheavals which occurred in the wake of reunification were more successful. Here, German citizens and opinion leaders asserted a vision of their national identity which did not tolerate xenophobic or neo-fascist elements, and illustrated their vision by pointing to survey results and public demonstrations against right-wing violence. This negotiation between their national character and their international image proved more successful than Iraq's, in part because government officials were able to build upon the citizen efforts in presenting their case to the domestic and international media.

The process of the construction of identity, outlined briefly in these two case studies, defines an agenda for future research. This research must necessarily focus upon two variables: national character, or how citizens conceive of their nation's boundaries, culture, historical heritage, and ethnic composition; and international image, or how other nations conceive of that nation's identity. The former variable may be measured, in part, by survey data from public opinion studies within the respective nation[41]. The latter involves world opinion about the nation's identity, and is harder to measure. Such tools as media content analyses, and international surveys which study opinion on the subject within various nations, are useful in operationalizing this variable. Also, the degree of influence a nation has over the international media, as measured partly by the credibility and power of its own media outlets, is an important factor which must be considered in this negotiation.

Finally, the two brief case studies of negotiation between national consciousness and international image can serve as opposite extremes within which many nations' situations will fall. When one examines the case of the former Yugoslavian republic, for instance, its leaders and the Serbian forces seek to tread a fine line between unacceptable aggression and actions which prompt criticism, but not action, by other nations. Their attempts to assuage moral condemnations by reference to Muslim atrocities during the Second World War are a critical part of this negotiation. Indeed, all of the previously described elements of negotiation can be seen in this description of the conflict from a New York Times editorial of July 29, 1993:

> The international community appears content to wash its hands of Bosnia-Herzegovina. Yet... Bosnia-Herzegovina and the Balkan peninsula have not yet washed their hands of the international community...

---

[41] Indeed, there is a tradition of this form of study regarding national character that goes back to the original study of the "civic culture." See Almond, Gabriel and Verba, Sidney. **The Civic Culture**. Boston: Little, Brown and Company, 1965.

> In the two year since the war began, the international community-- in particular the U.S., Germany, Britain, France, Russia, and Turkey-- has been unable to develop a policy of consensus to kill the beast...
>
> It must stifle the military zeal on all sides and then invent a political mechanism to deal with the two central causes of the tragedy: disputed borders and minorities[42].

The clear references to the interactions between this troubled area and the world community, and the call for "political mechanisms" to be established to curtail the effects of Serbian and Croat nationalism, underscore the role of world opinion in defining the legitimate borders and populations to be included within a nation's identity.

These issues, and the new role of political communication in the negotiation of identity, define the major structure of conflict in the post-Cold War era. Nations will struggle to establish their status in the new world order. Leaders will be driven to extreme or preventative actions by their citizens' psychological need for a sense of "dignity" to overcome new feelings of ressentiment generated by the collapse of one path to national pride. These questions of identity, and the negotiations which take place in the broadest of international forums, have their source in the psychic needs of individual citizens. The challenge in creating a new world order lies in reconciling these micro-level needs with the macro-level negotiations involved in satisfying them.

JOHN QUINCY ADAMS AND CIVIL THEOLOGY: THE RELIGIOUS FOUNDATIONS OF AMERICAN LIBERTY

John Quincy Adams, like his father's generation before him, looked to America as the expression of certain objective truths to which both the cosmic order and human society were thought to owe their existence. That order was conceived in both religious and secular terms. The religious order ran the gamut from English High Church through puritanism to the Quakers, and the rational order was received through the teachings of the Romans, Locke, and the French Encyclopedists.[1] Certain transcendent purposes were deemed essential for the workings of democracy. The Founding Fathers were practical philosophers whose views on democratic government and foreign policy were based on a clear-cut conception of the nature of man, the state, and the world. Edward S. Corwin, one of America's leading constitutional theorists, argued that these early American leaders succeeded in formulating principles of transcendental justice into terms of personal and private rights. The principles of natural law, he wrote, "were made by no human hands; indeed, if they did not antedate deity itself, they still express its nature as to bind and control it." These laws are eternal and immutable. In relation to such principles, "human laws are, when entitled to obedience...merely a record or transcript, and their enactment an act not of will or power, but one of discovery and declaration."[2] Although there are different schools of natural law and natural rights, there are fundamental principles common to all of them: that, in Cicero's words, "law is the bond of civil society," and that all men, governors as well as governed, are always under, are never above, laws; that these laws can be refined through rational discussion; and that the highest laws are those upon which all rational men of good will, when fully informed, will tend to agree.[3]

This paper draws on the concept of civil theology to elucidate the commentary of John Quincy Adams on the religious and political foundations of American liberty. A first section examines the concept of civil theology and its meaning for constitutional democracy. A second section reviews Adams' reliance on natural law to fortify the rights enumerated in the Declaration of Independence and Constitution of the United States. A third section takes up Adams' critique of the Articles of Confederation in the context of competing interpretations of political sovereignty. The fourth and fifth sections treat the link between religious liberty and republican virtue that Adams discovered in the colonial life and politics of New England.

I.

From the beginning of a new republic, American political life has been pervaded by religious symbolism. Revolutionary Americans celebrated the nation's unique destiny by worshipping

their founding fathers and glorifying their nascent institutions. The Declaration of Independence and the Constitution became the holy scriptures of a New Promised Land, called America. Symbols, rituals, political discourses of the most various sorts contributed to that sacred monument that Robert Bellah has called civil religion.[4] Bellah's analysis points to the genuine public-political dimension of any paradigm of civil order: "What we have, then, from the earliest years of the republic is a collection of beliefs, symbols, and rituals with respect to sacred things, and institutionalized as a collectivity." Moreover, he explains that civil religion is neither synonymous with Christianity in its various denominations nor an ideological substitute for Christianity. His examination of presidential messages and documents embraces the decisive order of symbols: "The God of civil religion is not only rather 'unitarian,' he is also on the austere side, much more related to order, law, and right than to salvation and love." America's civil religion draws upon "biblical archtypes": "Exodus, Chosen People, Promised Land, New Jerusalem, Sacrificial Death and Rebirth." Yet it is also genuinely new, concerned with the disposition and character of citizens able to build a "society perfectly in accord with the will of God as men can make it, and a light to all nations."[5]

As Bellah points out, however, there never has been a final, or doctrinal, interpretation of civil theology. Neither Washington portrayed as a genuine messiah, nor the mystical Lincoln, could bring more than their own individuality to the concept.[6] The precise reference to a theologica civilis, which appears in St. Augstine's City of God, can be traced back to the time of Marcus Varro (116-27 B.C.). The term theology itself was used by Plato in The Republic. His quest aimed at apprehending the existence of a transcendent reality (theos) by means of reason (logos) in the reality of political life. Ellis Sandoz notes that

> Civil theology in its first formal appearance consists then of propositionally stated true scientific knowledge of the divine order. It is the theology discerned and validated through reason by the philosopher, on the one hand, and through common sense and the logique du coeur evoked in every man by the persuasive beauty of mythic narrative and imitative representations, on the other hand.[7]

At the very core of this interpretation lies the notion of order, which is deemed to be essential for political societies. Bellah himself raised the crucial point that the separation of church and state "has not denied the political realm a religious dimension." This religious dimension should not obscure the very important point that a society's self-interpretation owes its social functions and symbols to the underlying experiences: "civil religion at its best is a genuine apprehension of

universal and transcendent religious reality as seen in, or, one could almost say, as revealed through the experience of the American people."[8] The experiential foundation of the science of politics, and the very source of scientific objectivity, is man's pre-scientific participation in all of the realms of being from the somatic and sentient to the moral, aesthetic and mystical levels of existence. Participation (Plato's methexis, Aristotle's metalepsis) forms the human consciousness (psyche) itself, the essence of man's nature and humanity.[9]

Civil theology, according to P. Weber-Schäfer, represents "the stabilizing element through which the cultic and mental coherence of political society is assured."[10] It provides the means to grapple with the ultimate account of reality within the boundaries of a particular national society. The mystical or noetic theology of the philosopher gives way in society to principles deemed by ordinary men to be essential for internal cohesion and preservation of the general welfare. "For every society," as Eric Voegelin suggested, "the self-understanding of its order is constitutive; and, therefore, every known society brings for us symbols...through which it expresses its experience of order." Voegelin's point is an important one for analyzing the link between civil theology and the meaning attributed to public good or virtue; "every study of order must concentrate on the acts of self-understanding and, then, pursue from this center the ramifications into the order of the collective existence."[11] In World Technology and Human Destiny, Voegelin outlined the main features of the civil theology associated with constitutional democracy. In order to operate, this system "presupposes that the constitution itself is in a way an article of faith, that constitutional democracy is the predominant mass creed, the civil theology of the society."[12] If this minimum requirement is fulfilled, then "the society can be pluralistic to the extent that free rein is given the residues of intellectual and spiritual movements (churchs, sects, ideologies, and... philosophy), assuming that they will live side by side without subverting the constitutional structure."[13]

The formation of an American civil theology coincided early on with attempts to foster a sense of national purpose, often allied with loud appeals to republican virtue. While thinkers such as St. Augustine and Rousseau questioned the compatibility between republicanism and Christianity, the self-interpretation of Americans often looked to a fundamental congruence between republican virtue and religion. Because their republic was blended with liberalism, they understood the necessity of anchoring American society within a system of restraints to moderate execesses of self-interest. As Tocqueville noted, "while the law allows people to do everything, there are things which religion prevents them from imagining and forbids them to dare."[14] Religion may help to introduce this element of order to the broad contours of civil theology. "In order that society

should exist and, a fortiori, that a society should prosper," the French observer pointed out, "it is necessary that the minds of all the citizens should be rallied and held together by certain predominant ideas."[15] The political dimension of America's faith inheres in the enthusiastic worship by citizens upon the altar of natural rights. Indeed, religion invokes the authority of higher law and the necessity to consider moral values as safeguards of liberty within the polity. The civil theology that functioned for Americans as "a minimum dogma of creedal truths" looked in fact to religious diversity in order to sustain general and essential principles for the maintenance of public order. Thomas Reid, the founder of the Scottish common sense school of philosophy, elaborated on the religious and moral foundations of individual liberty.

> The arguments to prove that man is endowed with moral liberty...are three: Ist, Because he has a natural conviction or belief, that, in many cases, he acts freely; 2dly, Because he is accountable; and 3rdly, Because he is able to prosecute an end by long series of means adapted to it....We have, by our constitution, a natural conviction or belief that we act freely. A conviction...so universal, and so necessary in most of our rational operations, that it must be the result of our constitution, and the work of Him that made us.[16]

John Quincy Adams contributed to America's civil theology by recurring to the connection between higher law and the public duties of free citizens. Adams first entered the political arena in 1791 with the publication of his "Letters of Publicola," demolishing Thomas Paine's Rights of Man. These papers, which grew out of the controversy between Paine and Edmund Burke concerning the French Revolution, exemplify Adams' reliance on natural law to defend minority rights in republican government. Like the writings of his father, his seek to oppose the extreme views of Paine and of the French Revolution and yet to retain faith in the American theory of natural rights, including the "unalienable right of resistance to tyranny." It is not the basic premise of Paine's book to which he is opposed, but the conclusions which Paine infers from them. This "commentary upon the rights of man," Adams said, draws "questionable deductions from unquestionable principles." Paine, as the controversy develops, acknowledged "that which a whole nation chooses to do, it has a right to do." Adams countered that "it is of infinite consequence that the distinction between power and right should be fully acknowledged, and should be admitted as one of the fundamental principles of legislators." He continued:

> The principle, that a whole nation has a right to do whatever it pleases, cannot in any sense be admitted as true. The eternal and immutable laws of justice and of morality are paramount to human legislation. The

> violation of those laws is certainly within the power, but it is not among the rights of nations. The power of a nation is the collected power of all the individuals which compose it....If, therefore, a majority...are bound by no law human or divine, and have no other rule but their sovereign will and pleasure to direct them, what possible security can any citizen...have for the protection of unalienable rights? The principles of liberty must still be the sport of arbitrary power, and the hideous form of despotism must lay aside the diadem and the scepter, only to assume the party-colored garments of democracy.[17]

Adams found the world about him confined and controlled by a paramount law of nature, superior to the regulations of humans, a law which the logical mind could discern and apply to the political fortunes of nations. For example, he rejected the demand pressed on the Washington Administration that the United States support France against the combined powers of Europe in 1793. America was commanded by the "law of nature, which is paramount to all human legislation, or compact, to remain at peace, and to content ourselves with wishing that laureled victory may sit upon the sword of justice, and that smooth success may always be strewed before the feet of virtuous Freedom."[18] In his philosophical scheme, the United States occupied a unique position, for it was the first nation in history to announce foundation principles embedded in the law of nature. The Declaration of Independence announced "the <u>one</u> People, assuming their station among the Powers of the Earth, as a religious, civilized and Christian People--acknowledging themselves bound by the obligations, and claiming the rights to which they were entitled by the Laws of Nature and Nature's God." Moreover, the laws of nature applied to social intercourse between sovereign nations and found expression in the public law of Europe. These laws are "all derived from three sources:--the ...dictates of justice; usages, sanctioned by custom; and treaties, or national covenants." Adams acknowledged that "<u>Christian</u> nations, between themselves, admit, with various latitudes of interpretation, and little consistency of practice, the laws of humanity and mutual benevolence taught in the gospel of Christ."[19] Americans "laid the foundations of their government upon the eternal and unalterable principles of human rights." That government's essential purpose--the very reason for which it is instituted--is to secure the "natural rights of mankind" ensured that the structures of power would be "subordinate to the <u>moral</u> supremacy of the People."[20]

Like Benjamin Franklin, Adams acknowledged the "Necessity of a Publick Religion." He distanced himself, however, from the evangelical assumption that the American republic had to represent the ultimate embodiment of Christianity. Unlike the

early Puritans, and often at the expense of parental goodwill, the younger Adams did not adhere to the tenets of any one established church for the promotion of morality and civic virtue. The latter was seen as resulting from a collective responsibility of the political community for the promotion of public good. Part of that responsibility rested on estimates about Christian duties of fellowship and brotherhood, as well as on the potential of fallen man for social harmony and progress in an imperfect world. Adams' discourses on the New England Confederacy of 1643, and the natural law principles of the Massachusetts social compact, look to the organic basis of political association.[21] With reference to civil theology, he links the institutionalization of American liberty to the vivid participation of everyman in the full range of transcendent divine Being. It is worth remembering that the substance of man's participation is in the In-Between reality that is neither brute nor divine but properly human: that man is created a little lower than the angels and given dominion over the earth.[22] Adams' moral universe embraced the same human obligations Madison alluded to in the debate over the bill establishing religious freedom in Virginia.

> It is a duty of every man to render to the creator such homage...as he believes to be acceptable to him. This duty is precedent both in order of time and degree of obligation, to the claims of Civil Society. Before any man can be considered as a member of Civil Society, he must be considered as a subject of the Governor of the Universe: And if a member of Civil Society, who enters into any subordinate Association, must always do it with a reservation of his duty to the general authority, much more must every man who becomes a member of any particular Civil Society, do it was a saving allegiance to the Universal Sovereign.[23]

Adams, no less than Madison, turned to the superordinate sovereignty of God over the individual citizen, which precedes the sovereignty of political society over him.

Adams believed in the "genuine doctrines of Christianity in their application to the pursuit of happiness." In addition, he cited the "Socratic and Ciceronian moral philosophy as the most exalted system of human conduct ever presented to the world."[24] This synthesis of classical and Christian dimensions is broadly compatible with the moral-legal precepts shaping the Founders' faith in a constitution grounded in principles of higher law.

> Its tenets were beyond the ordinary level of human infirmity; and so are those of Christianity. It made the essence of virtue to consist in self-subjugation; and so does Christianity. It gave out a theory of perfection to the aim of man, and made the endeavor to

> attain it duty; so does Christianity. The perfect example...was not given, as by Christ; not even Socrates. Yet he, and Cicero...did attain an eminence of practical virtue.[25]

It was among the obligations of American statesmen, Adams believed, to "aim in so far as their abilities extend towards the moral purification of their country from besetting sins." This should be accomplished, in the first instance, "by setting the example of private morality"; and, second, "by promoting the cause in every way that they can lawfully act on others."[26] For Adams, natural religion was not the product of a spontaneous understanding in the heart, but was a learned body of principles in the keeping of society and brought to each generation by the forces of civic education.

In Adams' political theory, the Creator had made man a "social being," had blended his happiness with that of his fellow man, and government was a necessary instrumentality for the effectuation of this liaison. Yet he differed from the general spirit of his day, which was manifested in either a conservative desire for a government only strong enough to keep the enemies of social order in harness, or a more radical--and Jacksonian--opposition to strong government, except insofar as it must be used to keep the economic oligarchy from tyranny. Civil society merely reflected the prevailing concepts of character and virtue among its members. Government did represent "a restraint upon human action, and as such, a restraint upon Liberty." The constitutional framers were "aware that to induce the People to impose upon themselves such binding ligaments, motives were not less cogent than those from which the basis of human association were...necessary."[27] A theory of rights, therefore, is inconceivable without a corresponding conception of obligations. A passage from Adams' first State of the Union address is worth quoting at length.

> The great object of the institution of civil government is the improvement of the condition of those who are parties to the social compact, and no government...can accomplish the lawful ends of its institution but in proportion as it improves the condition of those over whom it is established....But moral, political, and intellectual improvement are duties assigned by the Author of Our Existence to social no less than individual man. For the fulfillment of these duties governments are invested with power, and for the attainment of the end...the exercise of delegated power is a duty as sacred...as the usurpation of powers not granted is criminal and odious.[28]

By no means, however, was Adams' tribute a ceremony of national self-congratulation. He believed that the doctrine of

internal improvement had more than an American application. He was, for example, filled with admiration for Peter the Great as the genius who had built St. Petersburg according to a magnificent plan. Peter applied his energies through government and the capital was suited to the leadership that was reorienting Russia in a new direction. As Secretary of State, Adams admonished the Columbians to think little of Columbia as a center of empire but to give due regard to the bounties of nature. "God to thee has done his part--do thine."[29] No negative suspicion of government limited his conception of what men could accomplish through its agency. He enjoined men of all lands to apply their skills through government to the task of internal improvement. He believed that the people would desire that which was good if they could see it; he believed that national resources should be used wisely, not for private speculation, but as the source from which the nation could promote its advancement in philosophy, literature, and the arts. Government should be held accountable to the people, but only to the best interests of that people, not to its commonplace or base desires.

Adams' inaugural in 1825 drew upon Christian symbols to illuminate the intersection between individual liberty and public order. He clearly put his office under the protection of "Heaven." A "religious obligation" informed his duty as head of the executive branch, while government "invariably and sacredly devoted" itself to upholding the constitution, "that revered instrument...founded upon the republican principle of equal rights." Yet Adams admitted that a republic, as a human construction, was not exempt from possible failures. "From evil--physical, moral, and political--it is not our claim to be exempt." Dissensions, which more than once threatened the dissolution of the Union, were rooted in "the theory of republican government; upon conflicting views of policy in our relations with foreign nations; upon jealousies of partial and sectional interests, aggravated by prejudices...which strangers to each other are ever apt to entertain." Against the collisions of faction and self-interest, Adams believed that the "harmony of...the whole Union is knit together by the sentiments of mutual respect, the habits of social intercourse, and the ties of personal friendship formed between the representatives of its several parts in the performance of their service at this metropolis." Adams concluded by reminding his fellow citizens

> that liberty is power; that the nation blessed with the largest portion of liberty must in proportion to its numbers be the most powerful nation upon earth, and that the tenure of power by man is, in the moral purposes of the Creator, upon condition that it shall be exercised to ends of beneficence, to improve the condition of himself and his fellow-men.[30]

America's national purpose was not "the glory of Roman ambition,

nor Tu regere Imperio populos--her momento to her sons." America's glory "is not dominion, but liberty. Her march is the march of the mind."[31]

II.

John Quincy Adams was the leading son of that generation of Americans whose sacrifice in defense of independence and liberty was immortalized as a celebration of self-evident truths about the unalienable rights of man's political existence. Adams, a youthful witness to the first patriots who fell at Bunker Hill, was inspired as much by the passions that accompany tragic loss as the exuberance that instills a righteous defense of noble causes. Intervening years of public service and notorious political battles did not lessen the vigor with which he urged his countrymen to renew their national purpose. Yet his experience and his education taught him that the politician is little more than an inglorious ideologue when the limits of all human attainment are not acknowledged. The powers of speech, "the special prerogative of man, as a member of the animal creation, are not unlimited"; indeed, the power of reason, "though looking before and after, is bounded in its vision by an horizon; and Eloquence herself best performs her appropriate office by silence upon exhausted topics."[32] Upon the bonds of national union, Adams seldom exhibited either reticence or quiescence in seizing a moral vantage point from which to measure his nation's glory.

Adams readily admitted that the American experiment in self-government is "susceptible of being considered under a great variety of points of view." While the contemplation of its causes "must...ever remain the same," the estimation "of its consequences varies from year to year." Addressing the citizens of Quincy in 1831, on the fiftieth anniversary of the Declaration of Independence, Adams reminded his audience that man is both a creature and creator of history. A speaker, on the first anniversary of the Declaration, "had a far different theme from him who now, after the lapse of nearly two generations...is called upon to review the progress of [its] principles...as their influence has expanded on the mind of civilized man." Adams believed that the test of all principle is time; "that which when first announced as truth, may be treated by the...unanimous voice of mankind as pernicious paradox or hateful heresy, [but] when scrutinized...and felt in practical results, may become an axiom of knowledge, or an article of uncontroverted faith." Adams cited the example of the astronomer,

> who in his nightly visitation of the heavens perceives a ray of light before unobserved, discovers no new phenomenon in nature. He is only the first to discern the beam which has glowed from the creation of the

> world. After-observations and the calculations of science will disclose whether it proceeded from a star fixed in the firmament from the birth of time, from a planet revolving around the central luminary of our system, or from a comet, "shaking from its horrid hair, pestilence and war.[33]

The Declaration of Independence, a "manifesto to the world," was the work of "delegates of thirteen distinct, but UNITED colonies of Great Britain, in the name and behalf of their people." It was a united declaration. Their union preceded their independence. The language of the document is: "We the Representatives of the United States of America, in General Congress assembled, do, in the name and authority of the good people of these Colonies, solemnly publish and declare that these United Colonies, are, and of right ought to be, free and independent States." This affirmation was the act of one people. The colonies are not named and their number is not designated. Moreover, no indication is provided as to "which of the colonies any one of the fifty-six delegates by whom it was signed had been deputed." The signers "announced their constituents to the world as one people, and unitedly declared the Colonies to which they...belonged, united, free and independent states." The Declaration was much more than a proclamation to the world that the colonies had ceased to be a colonial dependency of Britain; these united people, Adams said, "had bound themselves, before God, to a primitive social compact of union, freedom and independence."[34]

The motive for the Declaration was avowed to be "a decent respect for the opinions of mankind"; its purpose was to declare the causes which led the people of the English colonies to separate themselves from Britain. The causes of separation enumerated by the colonists were followed by "their assumption of the separate and equal station to which the laws of nature and of nature's God entitle them among the powers of the earth." Preliminary to indexing the "history of repeated injuries and usurpations" under George III, Jefferson paid tribute to the self-evident character of universal human rights. The first movement of the American Revolution began with an appeal to natural law "for their right to assume the attributes of sovereign power as an independent nation."[35]

> The causes of their necessary separation...alleged in the Declaration, are all founded on the same laws of nature and of nature's God--and hence as preliminary to the enumeration of the causes of separation, they set forth as self-evident truths, the rights of individual man...to life, to liberty, to the pursuit of happiness. That all men are created equal. That to secure the rights of life, liberty and the pursuits of happiness, governments are instituted among men, deriving their

just powers from the consent of the governed.[36]

Natural law "presupposes the existence of a God, the moral ruler of the universe, and a rule of right and wrong, of just and unjust binding upon man; preceding all institutions of human society and of government." Government, then, is instituted to secure these rights of nature and may be altered or abolished "whenever any form of government becomes destructive of these ends."[37]

The Declaration acknowledged that the United Colonies were free and independent states, "but not that any one of them was a free and independent state, separate from the rest." Adams defended the case for a federal union by citing the analogous language contained in the state constitution for the Commonwealth of Massachusetts. Here it is declared that the body politic is formed by a voluntary association of individuals; "that it is a social compact, by which the whole people covenants with each citizen, and each citizen with the whole people, that all shall be governed by...laws, for the common good." Likewise, the body politic of the United States was formed "by the voluntary association of the people of the United Colonies." The Declaration was a "social compact, by which the whole people covenanted with each citizen of the United Colonies, and [where] the United Colonies were, and of right ought to be, free and independent states." In such a compact, union was as vital as freedom or independence. From the moment of signing, no state could, without violation of that primitive contract, secede or separate from the rest. Each was pledged to all, and all were pledged to each "by a concert of souls, without limitation of time, in the presence of Almighty God, and proclaimed to all mankind." Adams pointed out that the colonies were not declared sovereign states; in fact, the term sovereign is not to be found in the Declaration. Far removed "was it from the contemplation of those who composed...it, to constitute either the aggregate community, or any one of its members, with... uncontrollable despotic power." Adams was reminded of the message from John Milton's Paradise Lost:

> That were to make
> Strange contradiction, which to God himself
> Impossible is held, as argument
> Of weakness, not of power.[38]

These were united, free, and independent states. All three properties were equally essential to their existence. Without union, "the covenant contains no pledge of freedom or independence; without freedom, none of independence or union; without independence, none of union or freedom."[39]

Adams had little patience for those who protested that the philosophy embodied in the Declaration "deals too much in

abstractions." Rather this was precisely "its characteristic excellence," for upon those universal norms resided the justice of the nation's cause. Without them, the American Revolution would have been but one more successful rebellion.

> The Divinity that stirs within the soul of man is abstraction. The Creator of the universe is a spirit, and all spiritual nature is abstraction. Happy would it be, could we answer with equal confidence another objection, not to the Declaration, but to the consistency of the people by whom it was proclaimed! Thrice happy, could the appeal to the Supreme Judge of the World for rectitude of intention...have been [if] accompanied with an appeal equally bold to our own social institutions to illustrate the self-evident truths which are declared.[40]

The Declaration, then, was not an announcement of liberty "newly acquired, nor was it a form of government." Colonial Americans were already free, and their forms of government were various. The people of the colonies, speaking through their representatives, "constituted themselves one moral person before the face of their fellow man."

> Frederick I, of Brandenburg, constituted himself King of Prussia by putting a crown upon his own head. Napoleon Bonaparte invested his brows with the iron crown of Lombardy, and declared himself King of Italy. The Declaration of Independence was the crown with which the people of United America, rising...as one man, encircled their brows, and there it remains.[41]

The Founders recognized the "laws of nations, as they were observed and practiced among Christian communities"; they considered the state of nature between nations as a state of peace; and, as a necessary consequence, that the new confederacy was at peace with all other nations, Great Britain excepted.[42]

Adams wrote on several occasions about the significance of America's revolutionary mission as it grew out of, and in some respects departed from, the heritage of civil and political liberties of the British nation. America's struggle was for "chartered rights--for English liberties--for the causes of Algernon Sidney and John Hampden--for trial by jury--the Habeas Corpus and Magna Charta."[43] The civil wars of Britain in the seventeenth century "had been the result of a long and sanguinary conflict between the primary principles of human authority and human freedom." During the Hundred Years' War (1337-1453) with France, England became "the theatre of desolating civil wars upon a question in the theory of government, as insignificant to the people of the realm, as if it had been upon the merits of the badges respectively assumed by the parties to the strife." The

question between the Houses of York and Lancaster--antagonists in the Wars of the Roses--was "whether upon the death of a King of England, childless, the right to the crown devolved upon the son of a brother, previously deceased, but who had been next to himself by birth, or to his surviving younger brother." In this crisis, the British people "had abstracted from the personal qualities of the pretenders to the crown, no more interest than in the dissensions in the kingdom of Lilliput on the question [of] whether an egg should be broken at the big or at the little end." Yet the subsequent revolutions by which the House of Hanover supplanted that of the Stuarts "were of a very different character."[44]

The English Civil War, culminating in the regicide of Charles I in 1649, was not about "who had the right to the throne, but what were the rights of the throne." The matter could not be resolved without a reckoning of "the lawful extent of power" in the crown; the extent of obligation "upon the people to yield obedience to him"; the extent to which the people's "right and duty to defend themselves" can be substantiated against royal encroachments; and the extent to which "just and lawful" remedies may be produced against abuses of royal authority. Adams believed that the issue of ultimate political authority in the British political system involved "the question between right and might, between liberty and power." Philosophers and moralists alike have identified few other issues for which "war becomes the most imperious of human obligations, and the field of battle the sublimest theatre of heroic martyrdom and patriotic achievement." With the abdication of James II to France in 1688, the British nation construed his flight as a voluntary abdication of power. This he had done "by breaking the original contract between king and the people." With the accession to the throne in 1689 of William III and Mary II, "it had been settled...that the supreme powers of government, under their political constitution, were possessed and exercised by virtue of an original contract with the people."[45]

The charters of the thirteen colonies were also original contracts between the king and the people to whom they had been granted. By both long usage and common consent, this right became an acknowledged attribute of colonizing power; and in Great Britain, this was "a royal prerogative in which the Parliament had no agency." Adams alluded to an English Chancellor of the Exchequer, Charles Townsend, who "undertook to perform by an act of Parliament, that which he did not dare to attempt by the mere authority of the king." Legal experts "ascertained, since the days of John Hampden and ship-money, that the royal authority, however competent to the grant of charters, did not extend to the arbitrary levy of money by taxation...." The privileges of British subjects extended to the principle that no portion of their property could be confiscated "but by an authority in which they were represented." This was also the

principle to which American colonists appealed in their resistance against the Stamp and Tea Acts of 1765 and 1773.[46] "It was not," Adams said, "the burden of the tax to which they objected"; rather, "it was to the inherent servitude of the principle." With the passage of time, the ministers of George III prevailed upon Parliament "to repeal the tax but, at the same time, to declare their right to make laws for the colonies in all cases whatsoever." The taxation dispute, and the naked issue of power that arose with the Coercive Acts of 1774, brought about a dramatic showdown. "The dye is now cast," wrote George III to Lord North. "The Colonies must either submit or triumph." Dr. Samuel Johnson, in a controversial essay on the split between Britain and her colonies, laid down the principles behind British rule:

> All government is essentially absolute. That in sovereignty there are no gradations. That there may be limited royalty; there may be limited consulship; but there can be no limited government. There must in every society be some power or other from which there is no appeal; which admits no restrictions; which pervades the whole mass of the community; regulates and adjusts all subordinations; enacts laws or repeals them; erects or annuls judicatures; extends or contracts privileges; exempts itself from questions or control; and bounded only by physical necessity.[47]

Adams saw in Parliament's declaration of right the semblance of a mere declaration of power. Parliament's claim was "founded upon an erroneous first principle of government," one that was still "very far from being eradicated even at this day, in our own...country." No better authority could be found to substantiate the power of Parliament than "the great commentator upon the laws of England." In the words of William Blackstone: "There is, and must be, in all forms of government, however they began, or by what right...they subsist, a supreme, irresistible, absolute...authority, in which the jura summi imperii or the rights of sovereignty, reside." In treating the power of Parliament, he adds: "This is the place where that absolute despotic power which must in all governments reside somewhere, is entrusted by the constitution of the British kingdoms."[48] Adams thought Blackstone guilty of identifying a "false definition of the term sovereignty; an erroneous estimate of the extent of sovereign power."

> It is not true that there must be in all governments an absolute, uncontrolled, irresistible, and despotic power: nor is such power in any manner essential to sovereignty. The direct converse of the proposition is true. Uncontrollable power exists in no government upon earth. The sternist despotisms, in every region and...age of the world, are and have been under

> perpetual control; compelled, as Burke expresses it, to truckle and huckster. Unlimited power belongs not to the nature of man; and rotten will be the foundation of every government leaning upon such a maxim for its support.[49]

In addition, Blackstone's contention was incompatible with "the first principle of natural right." Adams cited the analogous example of defending the right to life. The birth of an infant carries a right to the life which it has received from the Creator. He acknowledged that ethicists have sometimes denied that this right can be forfeited to human laws, even by the commission of a crime. "Without concurring in that sentiment," Adams affirmed that no combination of human beings "has the power...not the physical but the moral power, to take a life not so forfeited, unless in self-defence or by the laws of war." No power in government exists to take it without a cause; "none, surely none, in the British Parliament." It mattered little to the substance of the argument that governments have exercised and do exercise this power. The law of nature cited in the Declaration of Independence was a judgment upon the arbitrary and destructive will of men. American statesman held to the self-evident truth, that the right of life is the first of the unalienable rights of man, and "to secure, and not to destroy that [for] which, governments are instituted among men." The sovereignty which arrogates to itself unlimited power "must appeal for its sanction to those illustrious expounders of human rights, Pharaoh of Egypt, and Herod the Great of Judea."[50]

John Selden, during the Petition of Right debate in the House of Commons in 1628, elaborated the ancient maxim in a way the American founders would later approve when he asserted: "Salus populi suprema lex, et libertas popula summa salus populi," the welfare of the people is the supreme law, and the liberty of the people the greatest welfare of the people.[51] Statesmanship consisted in bringing man-made law into harmony with natural law. Reason must be left free to test the validity of all political policies, to set aside superstition, and to measure the artful contrivances of princes and courtiers. Only a political structure based on consent and agreement could leave reason free to correct the errors of the past and open the way for a bright new future.

Even after the promulgation of the Stamp Act, the independence of the colonies from Great Britain "was neither pretended nor contemplated by the great body of the people." In their emigration from Europe, the early American settlers reflected on the rights to which they would be entitled in the land of their new habituation, in addition to the obligations by which they would be bound to the land of their nativity.

The first of the reasons assigned by the parties to the

> New England Confederacy for their consociation, is...to advance the kingdom of...Christ and to enjoy the liberties of the Gospel in purity, with peace. This purpose was twofold and necessarily imported a system of national policy--the propagation of the Gospel bearing upon their relations with the natives of the country--and the enjoyment of their religious liberties, resulting from their domestic relations among themselves, and their dependent condition on their sovereign and their country beyond the seas.[52]

Even "David Hume, the Atheist Jacobite, at once their reviler and their eulogist, acknowledges [the Puritans] to have been the...exclusive founders of all the freedom of the British islands." The reciprocal influence of liberty and obligation did not contravene the relations "between a parent state and her colonies...founded upon the laws of nature and nations, modified by the civil institution of the colonizing state."

History teaches that the administration of human affairs often nurtures a "reluctance at recurring to the first principles of government." Practical men are "apt to entertain the opinion that they have little influence upon the conduct of nations, and theoretic men are often wild and fanciful in their application of [those principles]." Yet the passage of time made it unlikely "that the sentiment of local patriotism" among the original inhabitants would sustain a grateful "allegiance to a sovereign beyond the seas," changing in succession from a "Stuart to a Commonwealth, from a Commonwealth back to a Stuart, then to a William of Orange, to the wife of a Prince of Denmark, and finally to a family...of Germany." Adams cited the Scottish poet, Robert Burns, who in colloquy with himself exclaimed: "This is my own, my native land." But to what land would this exclamation have applied "upon the lips of Carver and Bradford, of Endicott and Winthrop?" America's colonial dependence, "suffered to enjoy the rights of Englishmen," was truncated when--in violation of those rights--Parliament "declared its own right to make laws for them in all cases...and undertook to give effect to this declaration by taxation." Americans were subjected to "a dependence [on] parchments and of proclamations, unsanctioned by the laws of nature [and] disavowed by the dictates of reason."[53]

III.

The Articles of Confederation was an abortive experiment created through the cooperation of Congress with the state legislatures, "without recurrence to the fountain of power, the people." This error "prostituted the faith and energy of the nation in peace" and became "a source of impotence in...the relations of the country with foreign powers." Unable to enact necessary taxes, generate revenue, or regulate commerce and

industry, this confederal system "disabled the nation from the performance of its engagements to others, and from the means of exacting the fulfillment of theirs in return." The Second Article provides: "Each state retains its sovereignty, freedom and independence, and every power, jurisdiction and right, which is not by this confederation expressly delegated to the United States, in Congress assembled." Adams saw in this provision a departure from both the language and guiding principles of the Declaration. Where, he asked, did each state get the sovereignty which it retains? The delegates at the Continental Congress in 1776 declared the "United Colonies" free and independent states. Not sovereign states--but the people alone--were the rightful source of all legitimate government. Certainly the people of each colony had not conferred sovereignty on each free and independent state, "nor could they...declare it, because each was already bound in union with all the rest; a union formed de facto, by the spontaneous revolutionary movement of the whole people, and organized by the meeting of the first Congress in 1774."[54] Adams likened the Articles--ratified on March 1, 1787--to "the statue of Pygmalion before its animation,--beautiful and lifeless."

> The articles of confederation, stamped with the features of contention; beginning with niggardly reservations of corporate rights, and in the grant of powers, seeming to have fallen into the frame of mind by the sentimental traveller, bargaining for a post chaise, and viewing his conventionist with an eye as if he was going with him to fight a duel![55]

The primary cause for these misfortunes, Adams suggested, lies in the same mistaken estimate of sovereignty which the British Parliament had made in undertaking to levy money upon the colonies by taxation. This "political sophism," finding an identity between sovereign and despotic power, had as "its offspring...the doctrine of nullification--i.e., the sovereign power of any one state of the confederacy to nullify any act of the whole twenty-four states [as of 1831], which the...state shall please to consider as unconstitutional." Adams later saw in nullification an effort to organize insurrection against the laws of the United States; "to interpose the arm of state sovereignty between rebellion and the halter; and to rescue the traitor from the gibbet." His break with the Federalist Party was facilitated by his belief that members of that party had laid plans for a rebellion by state authority against the government of the nation. Learning that William Plumer, Senator from New Hampshire, intended to write a history of the United States, he encouraged him to teach the doctrine of the indissolubility of the union. Although a state could not be punished for treason, "nullification cases herself in the complete steel of sovereign power."[56] Three decades prior to the Civil War, when "the paroxysm of this fever [had] hitherto proved not extensively

contagious," Adams recoiled in the warning of Francis Bacon, "not to measure the discontentments in the body politic by this"--

> ...whether they be just or unjust; nor yet by this, whether the griefs whereupon they rise, be great or small--neither to be secure, because they have been often or long, without ensuing peril. Not every fume or vapor turns indeed to a storm, but from vapors and exhortations imperceptibly gathered, the tempest of dissolution does come at last.[57]

Adams related a biblical parable to illumine the threat of disunion and war, a disturbing omen on the struggle between state sovereignty and national unity.

> The event of a conflict in arms, between the Union and one of its members...would be but an alternative of calamity to all. In the holy records of antiquity, we have two examples of a confederation ruptured by the severance of its members, one of which resulted, after three desperate battles, in the extermination of the seceding tribe. And the victorious people, instead of exulting in shouts of triumph, came to the house of God, and...lifted up their voices, and wept sore, and said, --Oh Lord God of Israel <u>why</u> is this come to pass in Israel, that there should be to-day one tribe lacking in Israel? The other was a successful example of resistance against tyrannical taxation, and severed forever the confederacy, the fragments forming separate kingdoms; and from that day their history presents an unbroken series of disastrous alliances, revolts, and rebellions, until both parts of the confederacy sunk into tributary servitude to the nations around them; till the countrymen of David and Solomon hung their harps upon the willows of Babylon, and were totally lost amidst the multitudes of Chaldean and Assyrian monarchies, 'the most despised portion of their slaves.'[58]

This alliance of states, from 1781 to 1787, was an attempt "to preserve their sovereignty entire; reluctant to confer power, because power might be abused; and also because they perceived that every grant of power to the confederate body could be made only by the relinquishment of their own." The Articles gave liberty to sectionalism. In fact, they symbolize Blackstone's fatal fallacy of unlimited sovereignty. These, Adams said, were errors not of intention, nor even of judgment, so much as of inexperience. The idea of recurring to the people of the union for a constitution "does not appear to have presented itself then to any mind." The result was humiliation and the appearance of great turmoil out of which finally came a "a national Constitution" made by the people "in their original

character,"[59] a Constitution to consummate the work begun by the Declaration.

The provisions of the Tenth Amendment to the Constitution testify to the supreme foundation of political authority, "anything in the constitution or laws of any State to the contrary notwithstanding." The Amendment declares that the powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the States respectively, or to the people. There are powers of government, then, reserved to the people, and which never have been delegated either to the United States or to the separate states. Neither the United States nor the states themselves "possess any powers, not delegated to them by the people--by the people of the whole Union to the United States--by the people of each State to that State." Therefore, it followed that the people of each state were incompetent to delegate to the state, any power already delegated by the people of the whole union to the United States. "In vain would" Adams "search all the Constitutions past or present of the states, for a power to nullify any act of the United States in Congress assembled." The pretence to grant such a power, "under the cabalistic denomination of sovereignty, would have been null and void." Nullification had been the vital disease of confederacies from the day when Philip of Macedon obtained a seat among the Amphyctions of Greece.[60]

The Declaration of Independence and Constitution were "founded upon one and the same theory of government," a theory "expounded in the writings of Locke, but...never...adopted by a great nation in practice." And, language being imperfect, the "extent of powers conferred...must in a very great degree depend upon the construction which it [the Constitution] received." There was an authoritative constitutional law that antedated the Constitutional document, as, for example, the law upholding the right of petition, which the Constitution confirmed but did not create.[61] While the higher law theory underlying American government commanded bipartisan affirmation, the practitioners of that theory were far from united on how that law shaped the institutions and machinery of a federal system. Alexander Hamilton and Thomas Jefferson were the "leading champions of two widely different theories of government." Jefferson, drawn "to the search and contemplation of abstract rights," objected to the initial draft of the basic document "for its supposed tendency to monarchy, and for its omission of a Declaration of Rights." Hamilton, "prompted by a natural temper aspiring to military renown," believed a more energetic national government was necessary; his federalism was wed "to the doctrine of implied powers...and to a liberal construction of all grants of power in the Constitution."[62]

The fight for ratification posed difficult questions, "not only in politics but in morals, and questions not less

controvertible of constitutional power were...involved." The Constitution balanced, one against the other, the fundamental rights of man, the sovereignty of the people, the rule of right and wrong, and responsibility to the supreme ruler of the Universe for the rightful use of power. In suggesting that the Constitution provided a "national government complicated with a federation," Adams paid tribute to this father for helping to establish "the balance...as the great and fundamental principle of the American Constitution."[63] A "charter of limited powers," it set the government of the United States off from those other governments constitutionally enabled to act "gubernativamente." Moreover, on the basis of sound interpretations of Chief Justice John Marshall, the Constitution restrained "the corporate action of States claiming to be Sovereign and Independent."[64] Since the powers under the Constitution were derived from the people, with a Lockean emphasis Adams insisted that they could not be delegated by the government to the states. Thus there existed a great moral bond between the people and the moral entity, the nation, which they had created, a moral bond that could be maintained only by the "heart" and not by "constraint."[65]

Adams joined Jefferson in expressing regret that the Bill of Rights had not been written into the original Constitution; he also asserted that the defect had not been fully remedied by the first ten articles of amendment. Including a provision for personal liberties "would have marked in a more emphatic manner [than the Preamble's "We the people of the United States"] the return from the derivative sovereignty of the states, to the constituent sovereignty of the people for the basis of the federal Union." This remedy might have "prevented many delicate and dangerous questions of conflicting jurisdictions" between different levels of government; in addition, it would have supplied an "informing principle" of civil liberties. For example, Adams held that the repressive power of government should be applied only against "actual transgression," that the freedom of the individual or group not be curtailed until it threatens immediately the social order. In a letter to Hyde de Neuville in 1817, Adams wrote:

> From the nature of...the laws of this [United States] country you will be aware that the repressive powers of the government, in their application to the freedom of individuals, are limited to cases of actual transgression, and do not extend to projects which, however exceptionable in their character, have not matured at least into an attempt or a commencement of execution.[66]

Personal liberty was formed upon a right inhering in every individual as his own--Jus Suum, and not created by government.[67] The defense of such personal liberty--the personal liberty of sailors attacked by the "press gang"--was the

cause of the War of 1812. The "sparing delegation and cautious distribution of power" in the American system "and the securities and hedges with which personal civil, political and religious liberty [were] surrounded" served as nowhere else in the world, Adams thought, to protect the individual's possession of such liberty.[68]

Adams doubted "whether a single constitution has been formed in Europe or in South America, without some violence, some admixture of conflicting force in its confection." In ancient mythology, the god of boundaries was the only deity unable to be assuaged by the sacrifice of blood; he, too, was the only god who refused to yield his place, even to Jupiter (the supreme God of the ancient Romans). In analogous fashion, Adams conceived of America as the "land-mark, bloodless and immoveable...between freedom and force." The ordinary proclamation of righteous principles he knew to be an insufficient safeguard for the liberties enshrined in a republican polity. After all, "myriad constitutions...decorated by the ornamental rights of man...have passed into the memory of things beyond the flood; leaving the principles behind--blood-stained and defaced--monuments...of their own mutilation." The measure of America's success would be seen by the extent to which the traditions of civic virtue would enable public servants to abide by the norms of accountability and lawful rule that such principles presume. While "much good has already been affected by the solemn proclamation of our principles, much more [may come] by the illustration of our example."[69]

Adams turned his attention to the republican virtue of the statesman in order to substantiate an organic connection between human nature and the defense of constitutional rule. The ethical character of the statesman is defined by two qualities, "both developed in his intercourse with his fellow creatures and...belonging to the immortal part of his nature." These entail broadly the spirit of command and the spirit of meekness. Their ideal combination in perfection was exhibited in the mortal life of Christ; the supernatural character of his earthly example was "a model to teach mortal man...what sublime elevation his nature is capable of ascending." They had also been displayed by the preceding legislator of the children of Israel:

> That shepherd, who first taught the chosen seed
> In the beginning, how the heavens and earth
> Rose out of Chaos...[70]

These two realms of human action--the dialectic between nature and spirit, necessity and freedom--"belong rather to the moral than the intellectual nature of man." In order to save command and self- assertion from arrogance, and to save meekness and self-sacrifice from weakness, man must be regulated by "a profound sense of responsibility to a higher Power." This

responsibility imposed a duty on the republican statesman to save democratic freedom from mindless mass indulgence, to give expression to objective standards of political conduct that reconcile the will of the majority with the rights of the minority. In the words of one leading political philosopher:

> Liberalism holds certain truths to be self-evident which no majority has the right to abrogate and from which...the legitimacy of majority rule derives....It is on this absolute and transcendent foundation that the philosophy of genuine democracy rests, and it is within this immutable framework that the processes of genuine democracy take place. The pluralism of these processes is subordinated to, and oriented toward, those absolute truths.[71]

Adams pointed to important conceptual distinctions in calling for objective political standards to regulate the performance of "republican...and even democratic institutions." He meant "by democratic, a government the administration of which must always be rendered comfortable to that predominating public opinion." America's government was not based upon the virtues or power of any one man--or "upon that honour which Montesquieu lays down as the...principle of monarchy," or "upon that fear which he pronounces [as] the basis of despotism"--but rather "upon that virtue which he...proclaims as a fundamental principle of republican government." Although conceding that the Constitution "was republican and democratic," Adams learned from Thucydides and Aristotle that "democracy was the most unstable and short-lived" form of rule. If virtue--the virtue of the people--was the foundation for republican government, then "the stability and duration of the government must depend upon the stability and duration of the virtue by which it is sustained." Virtue did not consist of one single substantive ideal or doctrine; on the contrary, it rested upon self-evident truths, rational and moral, from which society derived whatever truth was to be found in its thought and action. The relativism of majority rule--denying the existence of absolute, transcendent truth independent of the majority will--tends toward the immanent absolutism of a tyrannical majority, while the pluralism of genuine democracy assumes as its corollary the existence of such truth limiting the will of the majority. What Adams characterized as the "moral platform" of the Constitution was nothing other than those virtues by which man relies upon objective standards of universal validity to protect individual freedom while upholding the general welfare. The administration of republican government "must...be always pliable to the fluctuating varieties of public opinion"; at the same time, however, the stability of constitutional rule depends upon the "duration in the hearts and minds of the people of that virtue, or in other words, of those principles proclaimed in the Declaration...and embodied in the Constitution of the United States."[72]

IV.

Among the most powerful sentiments operating "upon the human heart, and...honorable to the human character, are those of veneration for our forefathers, and of love for our posterity." John Quincy Adams described them as the connecting links between the selfish and social passions. The precepts of Christianity, for example, establish the happiness of the individual on the basis of "innumerable and imperceptible ties" that bind man's destiny with that of his contemporaries; "by the power of filial reverence and parental affection, individual existence is extended beyond the limits of individual life, and the happiness of every age is chained in mutual dependence upon that of every other." Respect for ancestors "excites in the breast of man, interest in their history, attachment to their characters, concern for their errors, involuntary pride in their virtues." Posterity stimulates man to virtue by imitation of their example, and "fills him with the tenderest solicitude for their welfare." Man, Adams thought, was not made for himself alone; he was also made for his country by the obligations of the social compact. Under the influence of these principles, "Existence sees him spurn her bounded reign." The voice of history redeems his physical nature from the subjection of time and place. No longer a "puny insect shivering at a breeze," the human soul

> is the glory of creation--form'd to occupy all time and all extent: bounded during his residence upon earth, only by the boundaries of the world, and destined to life and immortality in brighter regions, when the fabric of nature itself shall dissolve and perish.[73]

Tacitus, in Vita Agricolae, records the battle address of the barbarian chieftain who, driven to a remote part of Britain, defended his country against the Roman invasion. Galgacus concludes the exhortation to his followers by a solemn appeal to these irresistible feelings--Proinde ituri in aciem, et majores vestros et posteros cogitate ("Think of your forefathers and of your posterity"). Celebrations of posterity are a pledge of respect "we bear to the memory of our ancestors" and "are...testimonials of our gratitude, and schools of virtue to our children." Cultivation of these sentiments--the formation of moral character--in civic education is less "innocent pleasure" and more "incumbent duty."[74]

From the first discovery of the Western Hemisphere by Columbus, until the settlement of Virginia, most of the expeditions to the New World "were...instigated by personal interests--Avarice and ambition had turned their souls to that pitch of exaltation." Selfish passions were the parents of their heroism, "that ardor of enterprise and stubbornness of pursuit, which set all danger at defiance and chain the violence of nature at their feet." It remained for the first settlers of New

England "to trample down obstructions equally formidable...under the single inspiration of conscience." Alluding to the history of the Plymouth settlers, Adams explained the execution of "that instrument of Government by which they formed themselves into a body-politic." The process was the result of "circumstances and discussions" that transpired both before and after the first landing upon the American coast. The Plymouth Colony stood out as a rare instance in human history "of that positive, original social compact, which speculative philosophers have imagined as the only legitimate source of government." Here was an example of that unanimous and personal assent "by all the individuals of the community, to the association by which they became a nation." The compact was a convincing "demonstration that the nature of civil government, abstracted from the political institutions of their native country, had been an object of their serious meditation." After twelve years of exile from England, the followers of John Robinson and William Brewster were "led to reflect upon the relative rights and duties of allegiance and subjection."[75]

The odyssey of the English Pilgrims from 1608 until 1620, particularly the intellectual ferment to which they were exposed in relocating to Amsterdam and Leyden, testified to the pursuit of order and liberty in the political existence of a free people. During this period, and after their separation from the crown of Spain, the people of the United Province witnessed a deadly struggle between two parties. "The contest embraced within its compass not only theological doctrines, but political principles, and Maurice and Barnevelt were the temporal leaders of the same rival factions, of which Episcopius and Polyander, were the ecclesiastical champions." That fundamental principles were deeply embedded in these dissensions was "evident from the immortal work of Grotius, upon the rights of war and peace, which...originated from them." Not only was Grotius "a most distinguished actor and sufferer in those important scenes of internal convulsion," but his On the Law of War and Peace (1625) "was first published very shortly after the departure of our forefathers from Leyden." Adams also cited passages from William Bradford's Of Plymouth Plantation (e.g., his account of how "Mr. Robinson more than once appeared...as a public disputant against Episcopius") to illustrate that "the whole English church at Leyden took a zealous interest in the religious part of the controversy."[76]

Although the Puritans wisely avoided entanglement in the political contentions of the upheaval, "the theoretic principles...could not fail to arrest their attention, and must have assisted them to form accurate ideas concerning the origin and extent of authority among men, independent of positive institutions." For Adams, the importance of these circumstances had to be weighed in the context of the state of opinions then prevalent in Britain. The whole substance of human authority

"was centered in the simple doctrine of royal prerogative, the origin of which was always traced in theory to divine institution." Only twenty years later, and for a half century thereafter, "the subject...became one of the principle topics of controversy between the ablést and most enlightened men in the nation." The instrument of voluntary association "executed on board the Mayflower, testifies that the parties to it had anticipated the improvement of their nation." In this sense, the social compact was formed "by a foreseeing and directing mind." In his History of America, William Robertson, the Irish historian, traced this pervasive mindset back to the Puritan settlers of Plymouth and of Massachusetts Bay.

> From the first institution of the Company of Massachusetts Bay, its members seem to have been animated by a spirit of innovation in civil policy as well as in religion; and by the habit of rejecting established usages in the one, they were prepared for deviating from them in another. They...applied for a royal charter, in order to give effect to their...acts of a body politic; but the persons whom they sent out to America...considered themselves as individuals, united together by voluntary association, possessing the natural right of men who form a society to adopt what mode of government and to enact what laws they deemed most conducive to general felicity.[77]

The social compact draws attention to the revolutionary sphere of political action within which institutional safeguards protect and defend the character of public--as opposed to private--freedom.

Even at this point, the difference between the Europeans and the Americans, whose minds were still influenced by an almost identical tradition, is conspicuous and important. Americans believed that public freedom consisted in having a share of public business, and that the activities connected with this business by no means constituted a burden but gave those who discharged them in public a feeling of happiness they could acquire nowhere else. Citizens were brought together (in Michael Harrington's words) by "the world and the public interest of liberty," and what moved them was "the passion for distinction" which John Adams held to be "more essential and remarkable" than any other human faculty:

> Wherever men, women, or children, are to be found, whether they be old or young, rich or poor, high or low, wise or foolish, ignorant or learned, every individual is seen to be strongly actuated by a desire to be seen, heard, talked of, approved and respected by the people about him, and within his knowledge.[78]

The virtue of this passion Adams called "emulation," the desire to excel another, and its vice he called "ambition" because it "aims at power as a means of distinction." And, psychologically speaking, these are the chief virtues and vices of political man. For the thirst and will to power, regardless of any passion for distinction, though characteristic of the tyrannical man, is no longer a typically political vice; rather, it becomes that quality which destroys all political life, its vices no less than its virtues. Lacking all passion for distinction, the tyrant has no desire to excel and finds it congenial to rise above the company of all men; conversely, it is the very desire to excel which makes men love the world and enjoy the company of their peers, and drives them into public business.[79]

Another "occasion for important reflections" was the attempt by the original settlers to establish "that community of goods and of labor which fanciful politicians, from the days of Plato to...Rousseau, have recommended as the fundamental law of a perfect republic." Adams viewed this theory as the byproduct of reasoning most flattering to the human character.

> If industry, frugality, and disinterested integrity, were alike the virtues of all, there would apparently be more of a social spirit, in making all property a common stock, and giving to each individual a proportional title to the wealth of the whole. Such is the basis upon which Plato forbids in his republic the division of property. Such is the system upon which Rousseau pronounces the first man who enclosed a field with a fence and said this is mine, a traitor to the human species.[80]

Adams took exception with this austere idealism and emphasized that "a wiser and more useful philosophy" would treat man "according to the nature in which he was formed." Man's capacity for virtue and self-transcendence cannot be understood at all if a capacity for, and inclination toward, evil in man himself is not presupposed. We are, as Adams knew, in the presence of an anxious being "subject to infirmities, which no wisdom can remedy; to weaknesses which no institution can strengthen; to vices which no legislation can correct." A similar message can be found in Psalms 8:4, "When I consider thy heavens, the work of thy fingers, the moon and the stars, which thou hast ordained; What is man thou art mindful of him?" The vantage point from which man judges his insignificance is a rather significant vantage point. This fact, according to theologian Reinhold Niebuhr, has not been lost on modern thinkers whose modesty before the cosmic immensity was modified considerably by pride in their discovery of this immensity. It was a modern, the poet Swinburne, who sang triumphantly:

> The seal of his knowledge is sure, the truth and his

spirit are wed:...
Glory to Man in the highest! For man is the master of things,[81]

thereby proving that the advance of human knowledge about the world does not abate the pride of man. Adams recognized that the creative and destructive possibilities of human history are inextricably intermingled. The very power which organizes society and establishes justice, also generates injustice by its preponderance of power.

Adams' estimate of the human condition led him to conclude "that separate property is the natural and indisputable right of separate exertion--that community of goods without community of toil is oppressive and unjust." It counteracts the laws of nature, "which prescribe...that he only who sows the seed shall reap the harvest." Communalism, therefore, discourages all energy by destroying its rewards; it also "makes the most virtuous and active members of society the slaves and drudges of the worst." The philosophical error of this system was demonstrated by the experiment among our [puritan] forefathers." To base principles of government upon "too advantageous an estimate of the human character [was] an error of inexperience, the source of which is so amiable, that it is impossible to censure it with severity." While the early Pilgrims were able to relinquish a communal dream "upon discovering its irremediable inefficacy," the excesses of the French Revolution pointed to "the same mistake, committed in our own age, and upon a larger theatre." Napoleon was the product of a social catastrophe that upheaved the whole social fabric in disregard of moral law. Adams saw clearly that, without a moral restraint on the "portentous anarchy" of the French masses, the result of the Revolution would be a "military government, by turns anarchical and despotic," itself unconfined by moral restraint, even though clothed with "democratic forms." The first Americans "had no pride of vain philosophy to support, no perfidious rage of faction to glut, by persevering in their mistakes until they should be extinguished in torrents of blood."[82]

V.

John Quincy Adams began a biography of his father's life by documenting the historical and religious traditions which defined his own intellectual heritage, as much as the civic culture of the early New England settlers. There was nothing which so clearly characterized the "Puritan founders...as their institutions for the education of youth." It did not escape Adams' attention that many of the prodigious changes heralded by the Reformation began in the universities. " [John] Wickliffe, John Huss, Jerome of Prague, and Luther, all promulgated their doctrines first from the bosom of universities." Moreover, the

debate between the Protestant reformers and the Church of Rome "was essentially a question between liberty and power; between submission to the dictates of other men and the free exercise of individual faculties." Universities were centers of Christianity, "the original ideal of which may...have been adopted from the schools of the Grecian sophists and philosophers, but which were essential improvements upon them." Against the authority of Rome, "founded upon the abstract principle of power," the Reformation, "in all its modifications, was founded upon the principle of liberty." Even the Bishop of Rome, as the successor of Saint Peter, is "yet compelled to rest upon human reason for the foundation of faith itself." Similarly, the Protestant churches, while acknowledging the Scriptures alone as the rule of faith, "universally recur to human authority for prescribing bounds to that freedom."

> It was in universities only that this...question between liberty and power could be debated...in all its bearings upon human agency. It enters into the profoundest recesses of metaphysical science; it mingles itself with the most important principles of morals. Now the...metaphysics of the universities were formed from the school of Aristotle...[he being] perhaps...the acutest intellect that ever appeared in the form of man. In that school, it was not difficult to find a syllogism...to demolish all human authority usurping the power to prescribe articles of religious faith, but not to erect a substitute for human authority in the mind of every individual.[83]

The principal achievement of the Reformation, then, was to substitute one form of human authority for another. The followers of "Luther, of Calvin, of John Knox, and of [Thomas] Cranmer, while renouncing...the supremacy of the Romish Church and the Pope, terminated their labors in the establishment of other supremacies in its stead." The community of Puritans saw that, among all the Protestant reformers, the Church of England departed least from the principles, and retained most of the practices, of the Church of Rome. The King substituted for the Pope as head of the Church; the Parliament, in regulating the faith of the people, performed the office of the ecclesiastical councils. Adams cited numerous examples of how, in England, the progress of the Reformation was entangled with both state affairs and the personal caprices of the monarch. Henry VIII, while earning the pious gratitude of Pope Leo X (son of Lorenzo de Medici) for his censure of Luther, "quickly learned from his angelic doctor, Thomas Aquinas, that the infallibility of the Pope could not legitimate his marriage with his brother's widow." Mary, the daughter of Catherine of Arragon, "restored the papal authority in all its despotism; and Elizabeth, the daughter of Anne Boleyn, restored again the Protestant supremacy upon the ruin of the triple tiara." The principles of Elizabeth were "not

less arbitrary than those of her father." Her Stuart successors, James I and Charles I, continued to countenance the Reformation just so far as its progress "contributed to the...extension of their own temporal power, and to resist...every step...to restore to its pristine purity and simplicity the religion of the meek and lowly Jesus." But even this "half way reformation," connected with the government of the state and the passions of individuals, still leaned "for its support from human reason upon the learning and intellect of the schools."[84]

When Henry VIII had exhausted the resources of his temporal power to enlist the aid of the Pope in dissolving his marriage with Catherine, his last resort to authority was to the opinions of the universities. Although the academies of learning were sometimes "warped by temporal interests and sordid passions," their glory resided in "the studies to which they afford access." Men of learning found little solace "by the expulsion of Locke," or "by the application of the scourge to...Milton, yet there it was that Milton and Locke drew the nutriment which made them the pride and glory of their country." For Adams and his Puritan ancestors, the English universities were the "cradles of the New England colonies; and the Reformation was their nursing mother."

> ...[while] the successive kings and queens of England, with their sycophant Parliaments...could shape and mold the reformation of the law, according to the standard of their politics and...vices, they could not so control the march of the mind in the universities. From the moment when the spell of human authority was broken, the right of private judgment resumed its functions; and when the student had been told that the only standard of faith was in the Scriptures, to prescribe creeds upon him under pains and penalties, however reasonable it might appear in White Hall [or] in St. Stephen's Chapel...was but inconsistency...and tyranny at Cambridge and even at Oxford.[85]

The unavoidable consequence of exercising private judgment is the diversity of faith. Human nature was so constituted, "that in everything relating to religion, different minds reasoning upon the same facts come to different conclusions."[86]

The seminal principle of the New England colonies, therefore, was religious controversy. Adams thought it impossible to set aside all human authority in the formation of religious belief. Faith itself, as defined by St. Paul, is "the substance of things hoped for, the evidence of things not seen." Without an express revelation from Heaven, however, the formation of this hope--as well as the belief in the existence of this evidence--"come not from the internal operations of the mind, but by tradition from others, by the authority of instruction." To deny human authority in religious matters is tantamount to

asserting "an abstract principle to which human practice cannot conform." Equally impractical is the imposition of unrestricted control, either secular or spiritual, over the exercise of the faculties of the human mind. In this connection, the younger Adams' recalled his father's standing at Harvard in 1751, placing fourteenth out of a class of twenty-four. At the time, the arrangement of class members was based upon family rank; it was not until the graduating class of 1773 that an alphabetical order was introduced in assigning the names and places of the members of each class. Adams saluted the innovation as an important demonstration of the rising ascendancy of republican principles in the country.

Orders and degrees
Jar not with liberty, but well consist.[87]

These were the words of Milton, "who, in all his works, displays a profound and anxious sense of the importance of just subordination."

For John Quincy Adams, the glory of the American Founders was "the gentle temper of Christian kindness--the rigorous observance of reciprocal justice--the unconquerable soul of conscious integrity." Their accomplishment was not in the clarion of conquest, or "colossal statues upon pedestals of human bones, to provoke and insult the tardy hand of heavenly retribution." Worldly fame had "been parsimonious of her favors to the memory of those generous champions," who exhibited "the better fortitude of patience and heroic martyrdom." Such hubris was "that common crier, whose existence is only known by the assemblage of multitudes--

> That pander of wealth and greatness so eager to haunt the palaces of fortune, and so fastidious to the houseless dignity of virtue--that parasite of pride, ever scornful to meekness, and ever obsequious to insolent power--that heedless trumpeter, whose ears are deaf to modest merit, and whose eyes are blind to bloodless distant excellence.[88]

Two principal objectives may guide other generations of American statesmen: to "emulate those qualities of their minds which we...find deserving of our admiration"; and to "recognize with candor those features which forbid approbation or even require censure." Adams' realism underscored the importance of comprehending both "their frailties and their perfections to our own hearts either as warning or as example."[89]

Adams seldom wavered in his confidence that nature's God intended a progressive improvement in the condition of man. His faith did not permit him to believe that such a transcendent purpose would be disappointed, even if his confidence in God was not always matched by trust in his countrymen. He wished to

avoid any "delusion of national vanity" in holding to the presumption that "our own country and her people have been selected as instruments for preparing...much of the good yet in reserve for the welfare...of the human race." Adams' tribute to American exceptionalism was a descent into humility, a feeling "of profound gratitude to the God of our Fathers" rather than the complacent certification of national grandeur. He also believed that it was "in the order of the dispensations of Providence to adapt the characters of men to the times in which they live." A life of tranquil ease could hardly define the mission of a new nation, a workshop of liberty as Madison defined it, through which the great energies of mankind would be displayed. Of the responsibility of the public servant to posterity, Adams wrote:

> Toils and dangers are the trials of the soul. Doomed to the first by his sentence at the fall, man, by submission, converts them into pleasure....To see them in advance...to meet them with the composure of unyielding resistance, and to abide with firm resignation the final dispensation of Him who rules the ball,--these are the dictates of philosophy--these are the precepts of religion--these are the principles of...patriotism;--these remain when all is lost--and of these is composed the spirit of independence....[90]

He understood that the formulation of the national purpose was often the story of bad theology and absurd metaphysics, of phony theories and vulgar delusions of grandeur. To deny the reality of the national purpose, however, is another matter altogether; it is to fall into the error of logical positivism, which denies the validity of either philosophy or religion because such knowledge is uncertain and subject to abuse. He had little more than contempt for what he termed "political empirics."[91] Yet the heroic symbols and high ideals through which a nation finds meaning are not simply figments of the imagination or artifacts of deception. They express in rational or symbolic terms the reality of an inner experience, which is not less real for not being of the senses. No government, as Madison wrote in Federalist #62, "will long be respected without being truly respectable; nor be truly respectable without possessing a certain portion of order and stability."[92] Adams' attachment to American principles, and the moral cement of national union, was echoed by Tobias Smollett in his "Ode To Independence."

> Thy spirit, Independence, let me share,
> Lord of the lion heart, and eagle eye!
> Thy steps I follow, with my bosom bare,
> Nor heed the storm that howls along the sky.[93]

Adams used a literary example from Virgil's Aeneid to throw into broad relief the political and moral obligations of

Americans gathered to celebrate the Jubilee of the Constitution. When the Goddess mother of Æneas supplies the celestial armor with which he is to triumph over his enemy, and thereby lay the foundations for Imperial Rome, he is depicted as gazing with confused delight upon the crested helm that vomits golden fires--

> His hands the fatal sword and corslet hold,
> One keen with temper'd steel--one stiff with gold:
> He shakes the pointed spear, and longs to try
> The plated cuishes on his manly thigh;
> But most admires the shield's mysterious mould,
> And Roman triumphs rising on the gold--[94]

Adams saw America's dominion rooted in the power of moral restraint rather than in the energies of imperial conquest. The statesmanship of Washington, in contrast to the martial zeal of Æneas, drew strength from its own celestial armor--"a helmet, consisting of the principles of piety, of justice, [and] of honour." Justice encompasses "the whole duty of man in the social institutions of society toward his neighbour."[95] The failings of human nature required that Washington's "spear, studded with the self-evident truths of the Declaration of Independence," be the same "with which he...led the armies of his country...to the summit of the triumphal arch of independence." Adams hereby affirmed the admixture of persuasion and coercion indispensable for the preservation of individual liberty. His political thought made room for justice and cohesion, each the ultimate guarantor of the other. Only a stable social order could institutionalize justice; only a just social order could avoid disintegration. The statesman's task is not to eschew coercion, but to find the mode of coercion that is least destructive and most redemptive--i.e., most likely to preserve some sense of community within and between nations.

Adams' challenge to his countrymen was no different from the fundamental question posed by the authors of the Federalist Papers, "whether societies of men are really capable or not of establishing good government through reflection and choice."[96] Hannah Arendt, one of the few philosophers to give a theoretic interpretation of the problem of the founding of the American republic, noted that "beginning and principle, principium and principle, are not only related to each other but are coeval." Drawing on the language of antiquity at the threshold between myth and philosophy, Arendt noticed the philosophical duties of the founding statesman:

> The absolute from which the beginning is to derive its own validity and which must save it...from its inherent arbitrariness is the principle which, together with it, makes its appearance in the world. The way the beginner [statesman] starts whatever he intends to do lays down the law of action for those who have joined

> him in order to partake in the enterprise to bring about its accomplishment. As such, the principle inspires the deeds that are to follow and remains apparent as long as the action lasts.[97]

A similar inspiration prompted Adams to return to this theme sixty-two years after America's independence. Speaking before the citizens of Newburyport in 1837, he suggested that the duties of the future could not be contemplated apart from the beginning of American national history. He exhorted his listeners:

> to review the principles proclaimed by the founders of your empire; to examine what has been their operation upon your own destinies, and upon the history of mankind; to scrutinize...your condition at this day; to compare it with that of your fathers on the day which you propose to commemorate [the sixty first anniversary of the Declaration of Independence]; and to discern what portion of their principles has been retained inviolate,--what portion of them has been weakened...or abandoned; and what portion of them it is your first of duties to retain, to preserve,...to transmit to your offspring...and [to be] transmitted to <u>their</u> posterity of unnumbered ages to come.[98]

Adams' appeal to civic virtue, as Jürgen Gebhardt points out, is couched in the language of classical politics, of Machiavelli, and of Anglo-Saxon Whiggery. In the <u>Discourses</u>, Machiavelli argues that the survival of social order in a republic necessitates "<u>ritirarla spesso verso il su principio</u>"--"bring them back to their original principles." In Book III, Machiavelli writes: "It may be concluded...that there is nothing more necessary in a...republic than to restore to it the reputation that it had at its beginnings and to strive to see that there are either good laws or good men to produce this effect without...resort to external forces."[99] Beginning and principle, as Gebhardt explains, are identical in that at the moment of its founding every society contains a <u>bontà</u> "by means of which they obtain their first growth and reputation."[100] Return to the beginning, then, means regaining a primary <u>bontà</u>, the original content of order within the founding principles. Article 19 of the Massachusetts state constitution, for example, reads:

> A frequent recurrence to the fundamental principles of the constitution, and a constant adherence to those of piety, justice, moderation, temperance, industry, and frugality, are absolutely necessary to preserve the advantages of liberty, and to maintain a free government. The people ought, consequently, to have a particular attention to all those principles, in the choice of their officers and representatives, and they

> have a right to require of their lawgivers and magistrates an exact and constant observation of them, in the formation of the laws necessary for the good administration of the commonwealth.[101]

These principles embrace the civic virtue underlying the formal rules and institutions of republic government.

Had Adams been permitted to select a name for the party of his political affiliation, it would have been that of Constitutionalist; "meaning thereby faithful adhesion to the two Constitutions, of the United States and of the Commonwealth." Both were the work of the people; one of the Union, the other of the State--"not of the whole people, by the phantom of universal suffrage, but of the whole people by that portion of them capable of contracting for the whole." This new experiment in republican government was not "the work...of eternal justice ruling through the people, but of man,--frail, fallen, imperfect man, following the dictates of his nature and [still] aspiring to perfection." America's constitutional heritage was not to be found in the politics of democracy, nor of monarchy or aristocracy, "but in a compound of them all, of which democracy is the vital air, too pure in itself for human respiration, but which, in...union with other elements equally destructive in themselves and less pure, forms the moral and political atmospheric...in which we...have our being." But above all else, and even in the heat of party collisions, Adams appealed to a cause embracing and transcending all others:

> ...like the all surrounding orb in the philosophical theory of the learned and ingenious [James] Bowdoin, President of the Convention which formed the Constitution of [the Massachusetts] Commonwealth, which he supposed necessary as a counterbalance to the principle of gravitation, to preserve the system of the material universe from ruin--that cause, before which all party spirit must hide...kindling every affection of the heart, and inspiring every faculty of the soul--the cause of <u>our Country</u>.[102]

THE MAKING OF AMERICAN ANTIPOVERTY POLICY: WILLARD WIRTZ AND THE OTHER WAR ON POVERTY

Judith Russell
Barnard College

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

In Spring 1993 Americans observed a new Democratic president falter and nearly lose an early critical battle on Capitol Hill because he could not change four votes in the Senate over his proposed economic stimulus program. The Clinton Administration had responded to unemployment by proposing some modest amount in its stimulus program for job training, but that was not its major tool because it was hoping that improvement in the general economy would be the principal factor in cutting down unemployment. The jobs component was in effect a buried antipoverty measure intended to bring some measure of relief to the unemployed in a jobless economic recovery, since a quarter of the money would have gone to unemployment insurance and another $1 billion was targetted for short-lived summer jobs. The problems were twofold. Clinton's package added $19.4 billion to the deficit Clinton was trying to cut and this weakened support for it even within his own party and, secondly, he did not have the political savvy to understand the first rule of domestic politics, persuasion. This was a far cry from January 8, 1964 when then newly inaugurated President Lyndon Johnson boldly announced to the nation that his administration would eliminate poverty across the land. We would be the first nation ever to attempt such a feat; there was no doubt that we would suceed. Johnson recognized that we had a national economy and mood that would permit such a large scale governmental effort fighting poverty and he knew he had the political capital and skills to lead the fight. What is interesting is that Johnson saw a public program benefitting the poor as increasing his political popularity while nearly thirty years later Clinton had to submerge relief in an economic program to promote the general economy.

Such radical renovations in our approach to antipoverty policy have been characteristic of the United States. We have never been clear on what our goals and methods are in antipoverty policy and our considerable experience with it has not produced consistent or coherent types of programs to eliminate poverty or to alleviate its consequences. We have never had anything like systematic overall planning to fight poverty and, most importantly, we have never had serious jobs programs on a national scale to address the chief cause of poverty which is unemployment. Why has our approach to poverty and its victims--most of whom are children today--been so half-hearted, so inconsistent, and so misguided?

One explanation is that the idea of poverty and the proper role of government in its resolution are unclear in the United States. Yet, such a compelling issue warrants greater clarity and closer scrutiny and that is my aim--to explore particular ideas and factors about poverty that have critically affected government antipoverty policymaking.[1] Specifically I examine ideas about jobs policies in the War on Poverty to understand why jobs programs did not become the centerpiece of the first large scale antipoverty initiative undertaken in the United States.

Prevailing attitudes in post World War II America viewed poverty and unemployment as anachronistic economic malfunctions that could be confronted through concerted national efforts. With the enactment of the Economic Opportunity Act of 1964 (EOA), the elimination of poverty became a first time national goal

anywhere in the world.[2] The War on Poverty of the 1960s was formulated in a policy atmosphere of extreme lability; the absence of any clear kind of consensus on what would be the "best" policy to eradicate poverty meant that it was a period of opportunity for ideas which might never have reached the policy agenda in more conventional times. The greatest failure of the War on Poverty, consequently, was in missing the mark on the most optimal solution to poverty at a singular time when, in fact, more conventional work-oriented solutions on a large scale might have had a remarkable impact on the poor. The War on Poverty could have been a massive program of government sponsored jobs and job training programs in conjunction with the private sector. This paper examines and explains why it was not. It emphasizes what I call a missed opportunity.[3] In spite of the extensive literature on the War on Poverty, one of the most interesting stories of that era remains untold. The War on Poverty could have taken a different route; we could have had a War on Poverty which dealt with poverty through large scale government directed programs aimed at unemployment, job training and provision, reskilling, reeducation--through any number and kind of programs that go into what could be called active labor market policies.[4] Had we concentrated significant governmental resources on job training when the then population of unskilled unemployed workers was much smaller and less intractable to having such job training succeed the dimensions of poverty we experience today might have been greatly attenuated.

The idea that unemployment, low levels of employment, and employment in low-paying, low-skilled "dead-end" sectors of the economy have hit African Americans disproportionately has been around a long time. In one way or another these work-oriented causes are seen as major contributors to wide scale poverty among black Americans, and are connected causally to the mushrooming of the so-called underclass in our cities. Today there is no lack of material to tell us how structural changes in the economy, how locational decisions of firms, how macro-economic factors, and how persistent (or evolving) discrimination have hit black Americans hard. William Julius Wilson has revalidated academic interest in poverty in the black community.[5] But although Wilson made it respectable to talk about the black poor again, he did not discover the problems of structural unemployment and its impact on black unemployment -- nor does he claim he did. Although we have an enormous underclass problem today, it was back in the early and mid sixties that the origins of this problem appeared and in fact dogged the planners of the War on Poverty. It was the anomoly of persistent poverty in a period of relative economic prosperity that in fact attracted economist Robert Lampman and Council of Economic Advisors Chairman Walter Heller in the first place. They saw a "disturbing paradox--poverty in the midst of plenty."[6] And they were instrumental in framing the issues that underlay the War on Poverty.

Although it was actually John Kennedy who--in a August 14, 1960 Hyde Park memorial speech--coined the phrase "war against poverty," Lyndon Johnson declared war on poverty in his January 8, 1964 State of the Union address.[7] He made it sound like a good business investment--"$1000 invested in salvaging an unemployable youth today can return $40,000 or more in his lifetime."[8] The War on

Poverty, of course, turned out to be a multifaceted program with a strong youth-oriented jobs component, and $800 million was appropriated for fiscal year 1965. Yet, with big exceptions like the Job Corps and Head Start, it was not such a good investment.

The first set of assumptions underlying the War on Poverty were that success in fighting poverty rested in the first place upon rapid and steady economic growth--macro economic assumptions. Increased economic growth would increase, so the argument went, employment opportunities and raise the demand for labor, pulling the poor into the economic mainstream. The 1964 Tax Cut--a fiscal stimulus measure--was explicitly viewed by antipoverty planners as a central part of the antipoverty strategy.[9]

The second set of assumptions, of course, were contained in the Economic Opportunity Act itself. Its six titles embodied numerous goals and were premised on the idea that poverty was a multidimentional phenomenon. While it did not use the language of "culture of poverty" it incorporated those assumptions, focusing on the world view and behavior of the poor.[10]

What is widely conceded about the War on Poverty was the absence of coordination and linkage among its programs. They were fragmented, poorly coordinated, and, of course, underfunded. More importantly, they failed to address in a comprehensive way the critical and demonstrated need for a large-scale employment effort among the poor, particularly the black poor who had been hit harder than any other group by structural changes in the American economy.

It was not that structural unemployment and its relationship to poverty was unknown in 1963. There was tremendous ability in the Kennedy and Johnson Administrations, and both presidents Kennedy and Johnson had access to, and called on, the best available talent in the nation to create and implement various kinds of public policy. David Halberstam wrote The Best and the Brightest showing how these presidents got the advice they needed on the Vietnam War, yet persisted in ignoring it.[11] And, although the Economic Opportunity Act, the omnibus legislation for the War on Poverty, had a considerable youth-oriented jobs component, it fell far short of the goals held by some of its key planners, in particular Secretary of Labor Willard Wirtz. In the end the problem was not that the idea of dealing with poverty through massive jobs programs was not proposed. It was, by Wirtz. But these ideas lost out in the policy-making struggles over the EOA due to the confluence of three decisive sets of factors: (1) the world of economic ideas and the hegemonic ones at that time; (2) the institutional capacities of government, in particular the situation of the Department of Labor; and (3) the nature of governmental commitment to full racial equality for the black community, what we could call governmental will. What sets this study apart from other studies of the Kennedy and Johnson administrations is that evidence concerning these ideas has been drawn primarily from oral history interviews, internal administration documents, and other materials from the John F. Kennedy and Lyndon B. Johnson Presidential archives.[12]

How the War on Poverty Was Planned

Planning for the War on Poverty began in the Kennedy Administration early in 1963 when a series of articles and books on poverty prompted the president's interest and he directed Walter Heller, Chairman of the Council of Economic Advisors, to undertake a study of potential antipoverty initiatives. The issue of poverty had been in the back of Kennedy's mind in an inchoate kind of way since campaigning in the West Virginia primary, and he was looking for domestic policy ideas on which to focus on for his second term.

In May 1963 Heller sought the assistance of income distribution expert Robert Lampman who produced guidelines that would be the factual basis for the potential poverty program. By the end of the summer Heller was directed by Kennedy's advisor Theodore Sorenson to pull together measures that might constitute an attack on poverty as part of Kennedy's 1964 legislative program. Heller did this by appointing his assistant William Capron to create an informal task force of officials. This group came up with a predictable list of about 150 poverty program proposals of obsolete programs and stale ideas from the past that pleased no one.[13] In the fall of 1963 Kermit Gordon and William Cannon of the Budget Bureau also became prominent in organizing the initiative.

At this juncture--seeking a more striking concept for the domestic poverty program and an organizing mechanism as well--Heller, Kermit Gordon, and William Capron seized on the idea of Community Action Programs (CAPS) which had been evolving at David Hackett's President's Committee on Juvenile Delinquency (PCJD). It was decided that CAPs, an unconventional strategy which emphasized organization and participation on the local level, was the new idea through which much of the potential poverty program would be coordinated.

Kennedy continued to be interested over the fall of 1963, but failed to give Heller an unequivocal commitment to the poverty program until November 19, three days before his death, when he gave it a guarded go ahead.[14] After Kennedy's death, Heller presented Johnson with the proposed policy agenda on poverty. Johnson took to it immediately and enthusiastically, declaring it "my kind of program;" he urged Heller to make it bigger and viewed it as the centerpiece of his domestic policy agenda. Johnson declared war on poverty in his State of the Union address on January 8, 1964, well before the clear outlines of the program had developed. On February 1 he appointed Peace Corps Director Sargent Shriver to head up the Task Force on Poverty which would formalize the ongoing work. Its work ended in the Economic Opportunity Act which became law on August 20, 1964.

The trajectory for the idea of a poverty program, then, was that it was initiated by Heller who began work with an informal antipoverty committee. He passed the baton to his assistant Capron and Budget Bureau actors Gordon and Cannon, but stayed closely involved. LBJ appointed Shriver who headed up the Task Force and brought in large numbers of other experts and interested parties, including Adam Yarmolinsky, who was his number two man. But, what happened to the idea of jobs policies?

Willard Wirtz had been urging a national program to eliminate poverty and

ignorance since he joined the Kennedy Administration as Assistant Secretary of Labor in 1961 under Arthur Goldberg. About a year later, in September 1962 he became Labor Secretary. Wirtz was at the center of Heller's informal explorations on the poverty program. He himself sat, or was represented by his staff, including Daniel Moynihan, on every composition and recomposition of the initial Heller committee. Wirtz was a central actor who believed that a massive government jobs program--he envisioned job training, public works, and possibly public employment--would be most effective in attacking employment related hard-core poverty. He believed the chief cause of poverty was unemployment and underemployment of male heads of households. His goal was a $5 billion dollar a year jobs program to be administered by the Labor Department.[15] Wirtz fought hard for this goal for this would have also given the Labor Department effective control of the War on Poverty. He thought he was going to win.[16] He might have won had the Council of Economic Advisors been chaired by an economist other than Walter Heller whose concept of Keynesianism owed less to macroeconomic ideas and more to government spending.

Economic ideas

Extraordinarily interesting work has been done in recent years on the development of theoretical and practical applications of economic philosophy and how the United States has been affected by the hegemony of particular configurations of economic ideas. Recently analysis by Margaret Weir has shown us how and why Keynesian economic ideas took on the anti planning cast they did in the US and the consequences of this.[17] There is no better illustration of the consequences American Keynesianism had on the policy environment than in the pattern of probabilities that confronted antipoverty policy in the the War on Poverty. Debates that began among economic experts in the earliest days of the Kennedy Administration over the causes and consequences of unemployment had repercussions well beyond macroeconomic management. They also shaped the strategies that would be chosen two years later on the Heller poverty committee that formulated the War on Poverty.

During the early 1960s, Heller and his CEA argued that the economy would respond to aggregate stimulation by returning to full employment and maintaining long term secular growth, thereby reducing poverty, the "rising tide will lift all boats" thesis. The poverty problem in Heller's mind in the first place was that due to economic slack, there had been a drastic slowdown in the rate at which the economy took people out of poverty.[18] A return to what the Council saw as "full employment" --4%-- would reverse that trend enabling the economy to pull people out of poverty at a rate similar to that of the immediate postwar years.

In contrast, Wirtz and other structuralists argued that the nation was experiencing structural problems in the labor market that fiscal measures alone would not solve; what were needed were interventionist jobs policies on a large scale. Joblessness, in this view, was structural and associated with technological, industrial, occupational, geographic, or demographic changes in the economy so that available

jobs did not match the available workforce in type, site, or number.[19] In the early 1960s, under Wirtz, the Department of Labor had begun to shift its focus from its previous work of generating statistics and handling labor disputes to the field of manpower to address these changes.

As early as 1961 this lack of consensus in economic thinking on the nature of unemployment found the CEA and Treasury Secretary Douglas Dillon on one side of the issue favoring aggregate stimulation through fiscal measures like the tax cut, and on the other side DOL officials, in particular Wirtz, labor specialists like Charles Killingsworth, and Federal Reserve Chairman William McChesney Martin favoring large scale jobs measures to addresss structural unemployment. Wirtz saw structural unemployment substantially from the vantage point of his job as Secretary of Labor. There was a strong strain of thinking of unemployment in technological terms in the DOL which, in view of the Labor Department's responsibilities, was understandable.[20] The fear was that technological characteristics of structural unemployment made it impossible ever to conquer the unemployment problem by expanded demand.[21] Wirtz did not believe that macroeconomic measures would ever achieve full employment without the addition of structural measures.[22] His job was to deal with the human consequences of economic thinking which led to concepts like full employment set at a 4 percent level of unemployment. Wirtz "regarded the 4 percent target as a kind of an affront to the labor movement, as unduly conservative, as in effect reflecting callousness toward unemployment."[23] He felt so strongly about the 4 percent goal that he successfully prevented Lyndon Johnson from ever mentioning a specific employment target," getting Johnson to stand behind the idea that as long as even one unemployed able bodied man was seeking work, unemployment was too great.[24] Wirtz also knew that Congress did not like the 4 percent unemployment figure any better than he did, and that they understood unemployment in the structural terms that affected their jobless constituents. Every time the unemployment figures came out, Wirtz had to testify before the Joint Economic Committee, and "there was a real consciousness in that Joint Economic Committee about the necessity of structural unemployment measures."[25]

Why was this lack of consensus so critical? Had there been clear consensus among experts over the nature of unemployment and how it was related to hard core joblessness--and in particular had the structuralist argument prevailed--the idea of jobs policies as the solution to poverty would have been considerably strengthened in subsequent struggles over the direction of the War on Poverty. Decisions made here, in other words, went on to limit the arena of appropriate choices later on.[26]

These differences were replayed in the spring and fall of 1963 as Heller and Wirtz repeatedly had sharp differences of opinion over the structural explanation, as they would later, over the role and scale of jobs programs in the poverty program. These head-on debates took place outside of Cabinet meetings, in committee and subcommittee meetings, in their respective offices, in Shriver's office--in meetings in the offices of presidential assistants Sorensen and Moyers. Wirtz was highly supportive of the tax program and spoke out regularly in its behalf. Yet, the facts of a "strong concentration of unemployment among the uneducated, the unskilled, and

the untrained" convinced him that considerable additional measures were needed to address structural unemployment.[27]

He pointed out that 34% of the unemployed were unskilled or semiskilled, two thirds of them had less than a high school education, and 23% of the unemployed were minorities.[28] At the same time long term (or hard core) unemployment had risen from 12 percent of total unemployment in 1952 to 18 percent in 1957 to 27 percent in 1963.[29] So, to Wirtz, although the tax cut was a critical first step, it alone would not eliminate poverty by bringing down the general rate of unemployment, not to 4% which was the Council's goal.

Wirtz pressed for job creation policies, training, and a public works strategy if needed. He wanted to make adult employment the central strategy of the War On Poverty. The CEA position made the tax cut the central unemployment strategy of the War on Poverty. A welter of additional social programs would address other specific needs of the poor, including job training for the young. And although Heller at times acknowledged the applicability of structuralist measures, he never espoused any real commitment to such an approach or supported them with any conviction.

To appreciate the significance of this dispute for antipoverty policy we have to look closely at two issues: first, what is the definition of full employment in the US and second, can it be achieved here chiefly through macroeconomic measures--as the CEA claimed in 1961--or are interventionist measures necessary--as Wirtz claimed--to provide jobs and job training for those unable to find jobs in the regular labor market? This is, of course, a complex issue, but the short answer is that in the absence of a governmental consensus on the priority of genuine full employment, a target set by the Council had to be consistent with the total economic goals of the Kennedy Administration--for Heller's Council it was 4%. But this target would not bring the poor into the economic mainstream, which still left large numbers of unemployed--and poor.[30] As for whether aggregate economic policies would ever create full employment, based on economic history the answer is no; the only time we ever had full full employment in the US was at the height of WWII, in 1944. The normal working of the US economy operates with high levels of involuntary unemployment.

Why did Heller refuse to fully accept the structural explanation? A number of explanations are possible.[31] It could have been due to the politics of gaining hegemony for Keynesian ideas in the Kennedy Administration and the Council's struggle to win acceptance of the tax cut. Perhaps it was a function of his and the Council's conviction that they had defeated the structural argument early on in the Kennedy Administration. Maybe it was due to a kind of arrogance on the part of theoretical economists to toward the propositions of "noneconomists." Or, as Wirtz suspected, perhaps they were dismissing the structural thesis in the Task Force period to further their own agenda, their wish for a showy innovative program in a campaign period.[32]

The Heller Council was wrong. Because of the weight of Heller and the CEA in influencing Kennedy to adopt Keynesian measures--the tax cut--and in deemphasizing the importance of structural unemployment and because of the central

role of Heller subsequently in orienting the initial policy planning stage of the War on Poverty, the War was premised on important misunderstandings of the causes of poverty. The War on Poverty was directed away from jobs because consensus was not formed among experts on the priority of unemployment as a cause of poverty. Why did the Heller Council win? The dominance of the CEA's aggregate demand perspective was largely due to their enhanced role and influence with President Kennedy. As Wirtz said, in "personal terms, professional terms, and governmental terms, Walter [Heller] and the Council exercised a huge influence on Kennedy."[33] Wirtz and his department did not have the same reputation for economic expertise, although they developed their "inhouse" research resources greatly over the decade.[34] Moreover, Wirtz's position was viewed as a territorial interest which, while true to some degree, in no way diminished the argument for jobs policies.

Two other factors compounded this lack of intellectual and technical consensus on causes, further weakening the case for jobs policies. One was the perceived incapacity of the Labor Department to administer the kind of large scale jobs program Wirtz was advocating, and the other was the failure of government policymakers to respond to the demonstrated call for jobs by the black community.

Incapacity in the Department of Labor

Increased attention has been given in recent years to explanations and arguments emphasizing the effects of institutional histories and administrative structures on the outcome of policies.[35] According to these analyses the histories and administrative arrangements of bureaucracies have shaped the way in which policy ideas have taken form. In 1960 the Department of Labor was at the edge of transition and illustrates in a compelling way how state capacities can influence the success or failure of policy ideas to take hold.

The 1960s was a critical period of transition and innovation for the Department of Labor in which the boundaries of government policy were transformed as the responsibilities and goals of the department came to include antipoverty policymaking. At the helm of the Labor Department was a dynamic administrator, William Willard Wirtz, who sought over the decade to "nationalize" a department handicapped by competition among its own nearly autonomous agencies. At the heart of the problem was the inertial drag of the United States Employment Service (USES) and questions of its willingness and ability to provide services to a new constituency, the poor. Recognition that the Employment Service was a hidebound agency in need of renovation was widespread among policymakers, in Congress, and among top echelon administrators in the Labor Department itself who sought to reorganize and redirect the agency to make it responsive to new jobs policy initiatives for the poor. The ambition of Secretary Wirtz in this period was to bring government manpower policies together under the control of a modernized Labor Department. Large scale jobs policies at the heart of the War on Poverty were part of this goal.

Concerns about the levels, patterns, and persistence of unemployment in the 1950s contributed to the recognition in the Labor Department of the need for

comprehensive manpower policy which began to be implemented in 1961.[36] Over the decade, three kinds of efforts for change were in process through legislation, through administrative reorganizations of the Department, and through changes in its operating methods. One of the early organizational changes highlighting the emphasis on manpower was the creation on April 20, 1961, of an Office of Manpower and Automation, one of the first acts of Wirtz's predecessor Secretary of Labor Arthur Goldberg.[37] Emanating from this office were concepts that served as the basis of new manpower legislation such as the popular Manpower Development and Training Act of 1962 (MDTA). Sparked by the concern for automation-related joblessness, the MDTA provided for occupational retraining for those unemployed who had an attachment to the workforce. As the second program of the New Frontier, and the first to survive the economic and political trials that confronted the Kennedy Administration, it was redirected toward unemployed youth and the disadvantaged after six months of looking for automation-related displacement had proved fruitless.[38] In this way it became the first of the manpower policies to serve as an antipoverty policy, and as such, it set the pattern for subsequent manpower and antipoverty programs.[39]

Responsibility for implementation and appropriations for the MDTA lay principally with the Labor Department.[40] From the outset, three operating agencies within the Labor Department vied for control of the new MDTA: the Office of Manpower, Automation, and Training (OMAT) which replaced the Office of Manpower and Automation with the passage of the MDTA; the Bureau of Apprenticeship and Training (BAT) which promoted and registered labor/management sponsored apprenticeships; and USES which, with the Unemployment Insurance Service, was a unit of the Bureau of Employment Security (BES).

The Office of Manpower, Automation, and Training had the advantage of having the Secretary's support and of having sole responsibility for administering the Manpower Demonstration and Training Act appropriation and it initially dominated departmental decisions for the program by assuming broad powers.[41] The Bureau of Apprenticeship and Training was given the responsibility for handling the on-the-job-training (OJT) component of MDTA and contracted this out directly to employers, although it did not have the extensive state or local arms that USES had to assist in carrying out its new responsibilities and was initially given no new staff capability.

The third competitor for the program, USES, was eager to have the main responsibility for administering the MDTA as it was originally conceived. USES was the agency through which the Labor Department had historically provided basic manpower services originally aimed at reducing unemployment through job matching. Entirely financed by the federal government, the system was locally oriented and administered at the state level and run by a 35,000 member state employment service bureaucracy. It was the oldest and largest employment service structure in the United States and the only nationwide one.[42] USES had the advantage of independent funding, drawing money from Title III of the Social Security Act which designated

part of the unemployment insurance payroll tax to go toward the maintenance of USES. It could also claim an independent source of power in the Interstate Conference of Employment Security Agencies (ICESA) which was linked to Congress's appropriations committees.[43] As the only nationwide manpower service system in the United States, it had the greatest potential capacity for administering national manpower policy in every state.

The major problem with USES was that it had never had a clear sense of organizational direction. Consequently, its goals and functions were in constant transformation. The service which was originally to have had been administered through a strong alliance between the federal and state government levels had become, except during the war years in which it was federalized, fifty autonomous agencies. Specifically there were two kinds of problems that affected the Employment Service. First, the Employment Service had traditionally linked employers and employees in the way of a labor exchange, thus providing a government-sponsored job matching service. During the 1930s and the post war period the labor exchange, as a result of recessions, was faced with low labor demand and a labor surplus. Consequently, the local staffs developed practices of "screening" the best applicants in order to induce employers to use the Service. This practice, known as "creaming," had persisted throughout the subsequent life of the Employment Service and was a considerable obstacle in the way of transforming USES to meet the new training and placement needs of the disadvantaged at the center of the War on Poverty. Second, the connection between Employment Service personnel and Unemployment Insurance personnel, as two units under BES sharing the same funding source in the Social Security employers' tax, worked to the disadvantage of the Service in the struggle over which unit should dominate the agency. The rerouting of the MDTA to deal with the hard core unemployed meant another shift in direction for USES in administering the act, and one which had little to do with either of its previous roles--labor exchange or administration of unemployment insurance. As the only competitor with a nationwide organizational capacity in place, it was the logical candidate for administering the program but its objectives were at variance with the shifting goals of the act.

In February 1963, five months after becoming Secretary, Wirtz set out to bring together training and employment functions in a new Manpower Administration in the Labor Department with Undersecretary John L. Henning serving as Manpower Administrator. The new Administration included BES, BAT, and OMAT. Yet, under the new Administration, each bureau continued to control its own budget and appropriations, staff, operations and organizational identity, and independent field structure. Nothing important had changed between the agencies, and Henning's role was reduced to that of an arbitrator. Soon, though, between these responsibilities and the new ones for the Employment Service created by the upsurge of employment related legislation in Congress, the need for a full time Manpower Administrator became apparent and John C. Donovan was appointed in April 1964.[44]

As manpower programs grew in size and multiplied, it was hoped by Wirtz and other key Labor Department officials that the Department would be assigned

responsibility for their administration, particularly the jobs programs associated with the Economic Opportunity Act. Wirtz himself was pushing for a $5 billion jobs program at the center of the evolving discussions of antipoverty policy.[45] Yet the newly created Office of Economic Opportunity became the administering agency for much of the new legislation, in particular ending up with the Job Corps on which Wirtz had set his sights. It was felt that the new agency "might not be bound by tradition and might be more creative in carrying out new functions."[46] When the Neighborhood Youth Corps (NYC) became a responsibility of the Labor Department under the EOA, it was not placed under the administration of the Employment Service; the decision of the Labor Department was to create its first new operating bureau since the Roosevelt Administration.[47] The Neighborhood Youth Corps became a separate agency and the fourth operating arm of the Labor Department along with BES, BAT,and OMAT.

Wirtz continued to try over the decade to draw training and work programs under the umbrella of the Manpower Administration and to create, in effect, new government capacities in the Labor Department. His efforts had measured success but the obstacles confronting him were enormous. Wirtz's success was minimal at centralizing manpower authority through legislation like the failed Manpower Services Act which was first introduced in Congress in 1966 and again in 1967 and which was defeated each time due to opposition from the ICESA. Wirtz's final attempt at centralizing control over the Employment Service began in 1967 when it was again decided to try to consolidate the divergent field organization and authorities of the Department. It would in the end bring Wirtz into a face to face confrontation with Lyndon Johnson. The reorganization would have combined the Employment Service and manpower training programs into one unit, placing the whole manpower network under one authority. Continuous discussion, extending into 1968, between top Labor Department officials and top presidential advisors Joe Califano and Jim Gaither, led to the announcement by Wirtz of the much needed reorganization on October 24, 1968, two weeks before the presidential election. It drew tremendous fire from the National Governor's Association, prompted by state Employment Service administrators.[48] President Johnson refused to support the reorganization, directing--after a heated showdown with Wirtz--the Secretary of Labor to rescind the announced reorganization. In an extraordinary moment of confrontation Wirtz refused to revoke his announced reorganization, and Johnson demanded his resignation.[49] An impasse developed between the two that was broken when Wirtz threatened to resign without rescinding the order, and when his assistants James Reynolds and Stanley Ruttenberg each agreed, if appointed Secretary to succeed Wirtz, to rescind the order, but they warned that they would resign simultaneously upon complying with the president. Wirtz remained committed to the reorganization even after the intervention of Secretary of Defense Clark Clifford and the Deputy Attorney General on behalf of the president.[50] The order remained unrescinded and unacted upon through the election and the outcome was left to the Nixon Administration.

In the spring of 1963 Willard Wirtz had promoted a poverty program with "an

immediate, priority emphasis on employment" at its center.[51] He sought a large-scale, integrated program of job training, public employment, and public works, believing that job training alone was insufficient to effectively address the extent of employment related poverty.[52] In the end jobs policies played an important role, but did not dominate the War on Poverty. Wirtz was massively handicapped in his quest by the state structures in place in the DOL, riding, in his struggles with Heller over jobs policies, a very bad horse. Labor was perceived as too set in its ways and administratively chaotic to take in the new ideas developing in the field of manpower and plagued by its inability to control the nearly automonous state agencies that had come to make up the United States Employment Service. The organizational problems of DOL officials and their inability to control key bureaus in the field were no secret in government. In spite of Wirtz's struggles over the decade to modernize the DOL--and he was partially successful--in 1963 its shortcomings were widely perceived and were presented as a factor mitigating against Wirtz's case. In the end, Wirtz and his idea of jobs programs for combatting poverty were left standing at the post largely because of the effects of three key factors. The first of these, described earlier, was the lack of consensus among experts as to the causes of unemployment and how it related to poverty. This factor was compounded by a second, the incapacity of the Labor Department to administer the kind of large scale jobs program it was advocating. Instead, the idea of Community Action was promoted by the Budget Bureau as a cheaper, more coherent program to serve as the centerpiece of the War on Poverty.[53]

Wirtz was well aware himself that the intractability of USES weighed against him. Indeed, controlling those state agencies was one of his earliest and most important goals. He was also convinced, though, that some degree of concern over Labor's administrative problems was feigned--a smokescreen--and was used by Heller and Shriver in promoting their own innovative ideas for the War on Poverty. In spite of his problems with the Employment Service, Wirtz still felt the best means of eliminating poverty were in the hands of the DOL and that it was better able to handle the operating responsibilities of administering jobs policies than a new set of agencies could. He thought that money spent in fighting poverty would do more good invested in jobs programs than in CAPS which, he believed, were the political outcome of bureaucratic politics in a campaign year. To Wirtz --Heller, Shriver, Adam Yarmolinsky and other advisors to Kennedy, and then Johnson, were so intent on finding something new--even if it was just new rhetoric--in a campaign year that "that goal became a larger consideration than the effective appraisal, any responsible appraisal, of the likely results of community action."[54] Today, of course, we know he may have been right.

Social Forces and Governmental Will

The third factor which weighed against large scale jobs policies in the formation of the War on Poverty is how the federal government regarded the political demands of the black community in this period. Beginning in the early 1960s important social forces outside of the Kennedy Administration's poverty

planning network intensified their call for jobs policies and their focus on black unemployment. Potentially setting the stage for a major jobs initiative, black elites in and outside of the civil rights coalition had been calling for jobs in the context of antidiscrimination and combatting poverty long before the national government began to mobilize for the War on Poverty.[55] Government's reaction to the long present call for jobs from the black community--a call that initially began early in the century--has been largely nonexistent historically, and where there has been a response it has been halting and partial. It was no different when antipoverty planning got underway in the Kennedy Administration. Such demands from blacks in the nation's cities were particularly concerted and direct in 1963, and were largely unheard.

The opportunity to tackle the problem of poverty with jobs programs had been present from the onset of the planning for the War on Poverty, as we have seen, and was missed for the reasons described above. The conventional wisdom of much of the literature on the origins of the War on Poverty is that the poor never asked for it; it was sprung from the policy deliberations of elites in the president's office in the Kennedy Administration. It is true that the instrumental policy decisions that led to the Economic Opportunity Act emerged from the executive office of the President: "There was no attempt to consult, there was no input of any kind that was directly targeted on the development of" the War on Poverty from the black civil rights leadership or community.[56] While it seems clear that no direct consultation took place with representatives of the black community, there is no clear consensus among the planning participants on the effect of the civil rights movement and the social unrest of the period on the formation of the War on Poverty. There is also no agreement on what the political role of the black community was in relation to the formation of antipoverty policy, whether antipoverty policy was a political necessity. But there had been a history of economic analysis by the black community which raised employment issues as being central to the well being of black Americans and the idea of government jobs programs and employment strategies as antipoverty measures had long been proposed by black leaders outside of government. There had also been, in 1963 a shift in the civil rights movement and the escalation of large scale social protest aimed at jobs and employment. But this analysis and its recommendations, and the economic focus of protest activity, were largely ignored by antipoverty planners. This paper argues that a central reason the call for jobs from the black community was ignored was <u>because</u> it came from the American black community, a community which at that particular point remained politically marginalized and was perceived as politically expendable.

<u>Black Unemployment and Poverty in the Sixties</u>

The 1964 Economic Report of the President, put together by Walter Heller and the Council of Economic Advisors, documented the magnitude of poverty in the nation as it was understood at that time. Over nine million families had money incomes below $3000 in 1962; 5.4 million families (seventeen million people) had incomes below $2000 in 1962; five million "unrelated individuals" had incomes below

$1500 and three million of these had incomes below $1000.[57] The profile of poverty among nonwhites revealed that while twenty-two percent of the poor were nonwhite, almost half of all nonwhites lived in poverty.[58] But the official picture failed to demonstrate the extent of the consequences of poverty and unemployment on the black poor.

Labor market expert Charles Killingworth's structural interpretation of black unemployment illustrated why black employment was affected so adversely and demonstrated the causes of black disadvantage in the labor market in the 1960s to be more complex than the usual explanations of racial discrimination and lack of education.[59] Killingsworth's analysis also strengthens the argument that a large scale jobs program to address unemployment was particularly warranted to address the special problems of joblessness in the black community.[60]

Unemployment was catastrophic in American urban ghettos in the sixties. Unemployment among young black males had begun to climb dangerously in the 1950s. By March 1964, when President Johnson proposed a nationwide War on Poverty to Congress, the official unemployment rate for black males was 9.3 percent, as against 4.7 percent for white males; the official black rate was nearly twice the rate for white males which was the usual ratio for this decade. But this official rate did not take into account the differential effects of labor force participation factors on black males, in particular the fact that when unemployment was high, as it was for black males, the scarcity of jobs discouraged many would-be workers from job seeking, thereby removing them from the statistics of those "actively seeking work," and consequently from official government employment statistics.[61] This hidden unemployment must be accounted for to obtain a realistic view of black unemployment. Taking it into account, the adjusted rate of black unemployment in March 1964 was 13.5 percent, as Killingsworth has shown; so that the true black rate of unemployment was nearly three times the white rate, rather than twice as it appeared to be in the official figures.[62] An official rate of unemployment for white workers of 4.7 percent was close to the Council of Economic Advisors' definition of full employment, which they set at 4 percent. But such a rate tolerated an official unemployment rate among all nonwhites of 8 percent and for black youth, an average rate of unemployment in the mid sixties of nearly 25 percent and 33 percent for young black males and females respectively. Arthur Ross has shown that in 1964 a total of 811,000 blacks were out of work, and that if their unemployment ratio had been 4 percent, the number would have been 332,000.[63] One in four black workers was unemployed at periods in the sixties; the same devastating rate that the nation experienced in the Depression. Moreover, the trend over the decade deteriorated for black youth. In June 1966, a record breaking month in which the American economy pushed out two million extra jobs, the unemployment rate among black eighteen and nineteen year olds rose to 32 percent, exceeding the previous June 1965 by 5 percentage points.[64] By the end of the decade, the unemployment rate for non-white youth was higher than it had been in 1964.[65]

Another characteristic of the employment picture faced by a large portion of the black community were the dead-end job opportunities that were available to the

poor. The ghetto labor market could look to low wage jobs that offered neither opportunities for advancement or security, where work conditions were demeaning and layoffs were customary, and where few skills and little education was required.

What did this mean for black workers?[66] Median income for black families in 1960 was $3,233 against $5,385 for white family income. Professional, managerial, and technical jobs were held by 23 percent of the white work force as against 6.7 percent of the black work force, most of whom were found in black schools, businesses, or construction. Eighty percent of black workers were in semiskilled, service, and unskilled jobs as against 40 percent of white workers. In white and light blue collar occupations (computer operators and secretaries for example) 13 percent of black workers were employed compared to 36 percent of white workers.

The black community was a limiting case of hard core unemployment; there was no group who experienced higher unemployment or experienced it more persistently. So remedies for structural unemployment were especially important to blacks. These employment issues were serious concerns of the black community and civil rights organizations. Early in the sixties the issues of jobs and employment gained momentum as concrete economic demands and goals were increasingly incorporated onto the agenda of the civil rights movement. In this period jobs and a more pronounced concern with economic equality became an important focus of black protest. The NAACP, the Urban League, and CORE and others were all addressing employment issues by this time. Over the decade they would bring pressure to bear on the Kennedy and Johnson Administrations to address the issue of black employment. Some important initiatives described below emerged in this period to reflect their judgment that jobs were central to full racial equality.

Among the more prominent initiatives was the 1963 March on Washington for Jobs and Freedom which was originally planned to emphasize the need for black employment. Over 200,000 mostly black marchers converged peacefully on the capital on August 28 in the largest protest of its kind that Washington had ever seen, demonstrating for quick and full action on civil rights and equal job opportunities.[67] Another initiative had taken place in June 1963 when Whitney Young and the Urban League issued a leading policy statement advocating a "Domestic Marshall Plan" which included "A conscious, planned effort [to] bring qualified Negroes into 'entrance jobs' in all types of employment, to upgrade them and aid them to qualify for advancement, and to place them in positions of responsibility, including the full range of management positions."[68]

The A. Phillip Randolph Institute issued a "Freedom Budget for All Americans" in 1966, seeking $185 billion in federal outlays between 1967 and 1975 and jobs projects and training to achieve full employment for the employable, a minimum wage of $2 an hour by 1968 or 1969, and a guaranteed income for the jobless, among other programs.[69]

Recognizing in 1966 that the civil rights coalition had run its course, Martin Luther King also began to change his emphasis, moving increasingly to class-based analyses of economic issues that confronted both blacks and poor whites. In this new territory, King and the SCLC faced a series of problems--poverty, joblessness, and

housing--that seemed to lie beyond the methods they had successfully promoted in the early days of the struggle in the South. King spoke of restructuring society, of rebuilding America's cities to benefit the poor, of nationalizing industries, and of a guaranteed annual wage.[70] In his work in Chicago, Cleveland, and Detroit, he made demands for jobs, open housing, citizen review of police and housing boards, economic boycotts of business.[71] The Poor People's Campaign was for King a step toward his plan for creating a new coalition to wage the struggle for economic rights.[72] Plans for the Poor People's March were completed by SCLC staff in mid February 1968. At the heart of the Campaign was the SCLC's proposal for a $12,000,000,000Economic Bill of Rights. Originally proposed by A. Phillip Randolph, the Bill guaranteed employment to all who could work, incomes to those who could not, a federal open housing act, and enforcement of integrated education. Toward his goal of building a broad coalition, King also turned to union organizing and strikes, taking the SCLC into campaigns that carried him to Atlanta; Memphis; Detroit; Birmingham; St. Petersburg, Florida; and to Charleston, Georgetown, and Florence, South Carolina.[73] He was assassinated in Memphis on April 4, 1968, and consequently never completed his plans to create an economic class coalition that cut across lines of race.

On March 1, 1968 the need for jobs in the black community was a leading finding in the report of the President's Commission on Civil Disorders, the Kerner Commission. The report called for public jobs to supplement new and existing jobs in the private sector, increased federal efforts for jobs and job training, and in education and housing, and recommended strong civil-rights enforcement.[74] Appointed by President Johnson in 1967 to study the conditions that led to the riots that destroyed large parts of the nation's ghettos in summer of that year, the Commission found that pervasive discrimination in employment and housing and in policy were the product of underlying white racism in American society.[75]

1963: A Year of Change

The year 1963 was in many respects as remarkable a year of change for America as was 1968. It was a year that marked the end of a certain kind of innocence for a generation of young black and white Americans who had grow up in the insular fifties and were just coming of age. In it the perception of the civil rights struggle deepened from the vision of a black problem into one of national crisis. The black struggle in the South begin to shift North, bringing with it new methods and startling intensity, and the issue of jobs and employment moved to the forefront of the civil rights agenda. During this year of change, a consistent theme that ran through 186 items in the New York Times' front pages, editorial pages, and "The News of the Week in Review" sections, was the need for employment in the black community.[76] This 1963 month by month coverage linked the issue of jobs and the black community, or concerned jobs-related issues of particular importance to the black unemployed, showing that black leaders, organizations, and masses were vigorously pressing for jobs.[77] Over the year the dominant domestic themes were clearly unemployment and civil rights, and, as my analysis has shown, civil rights was

also linked to employment for blacks regularly and frequently. The theme of joblessness for the nation as a whole, and for the hard core unemployed, was constantly emphasized on the front pages, and in the editorial sections of the Times, key sections. Although coverage began slowly in January, February, and March these stories were significant in that the need for employment and training was directly linked regularly to minorities and especially minority youth, and in their insistence that the president address the problems of unemployment of young people with more aggressive, forward-looking domestic policy. In April and May coverage doubled as black protest activity went up as did discussion of government related jobs measures. In June, July, and August coverage increased more than four fold. This bulge was caused by two factors. First, blacks were putting pressure on the federal government to get a strong civil rights measure passed, one which had a jobs related component and, second, blacks were putting pressure on cities and states to hire blacks--evidenced by the CORE and NAACP led demonstrations--and to address discrimination in hiring. After the August 28 March on Washington there was a fall off in coverage, although coverage was still substantial. Civil rights organizations were temporarily exhausted by the drains on their resources from mobilization for the March, and their attention was turned to the issue of integration in education, particularly to Alabama and the confrontation with Governor George Wallace there. Then, on November 16, 1963 a large front page headline announced "Kennedy Calls Jobs Vital, Outranking Civil Rights As The Most Pressing Need Facing The Nation."[78] This was a week before the president was killed, ten days after he had tentatively decided to push a poverty reduction program as part of his 1964 program, and three days before he gave Walter Heller the go ahead on the poverty program.[79] Furthermore, the initiation and exploration of a possible program on poverty had been going on at least since February or March of 1963.[80] In addition, the Times editorial writers had been hounding President Kennedy throughout the year of this analysis to do something significant about the jobs situation, and in fact had been pressing the issue during his entire administration. Jobs measures were also extremely popular in Congress as the votes for the MDTA, Public Works and Vocational Education showed. Finally, public attitudes were highly favorable toward the proposition that blacks should have equal opportunities for jobs, having grown steadily since World War II from 42 percent of the population in 1944 to 83 percent in 1963.[81]

What has been offered is evidence of the pressure for full employment, reduction of unemployment, job training, job provision, and ending discrimination in employment that came from the black community in the period leading up to planning for the War on Poverty and afterward. This pressure was particularly concerted and direct in 1963 when the planning got underway. It would have been an obvious, an indicated, and a natural linkage for antipoverty planners to connect the antipoverty agenda to the demonstrated need for jobs among the lowest paid and most unemployed group in the nation. Poverty was not an issue that received any appreciable public attention in the period and, over the year of the Times coverage, had been infrequently mentioned and generally only in relation to Appalachia. Yet

there was a pronounced emphasis on the need for employment in the nation generally and in the black community. While blacks did not ask for a War on Poverty, they were clearly asking for jobs and employment policy to aid the black community for whom unemployment was catastrophic in 1963. It is hard to understand why the jobs agenda and the antipoverty agenda would not be linked in the minds of policy planners, especially since the issue was linked for them by a forceful advocate in the Labor Department, Secretary Willard Wirtz. To better understand this failure it is necessary to consider the dilemma in terms of the government's will to respond to the black community which will be taken up next.

Governmental Response to the Black Community

President Kennedy's characteristic ambivalence and reluctance to commit his administration resolutely to the cause of civil rights was well known to the black leadership and well documented also by the New York Times in 1963. Although he asserted that the civil rights issue was of great moral concern to him, and would receive the full weight of his authority as president, in fact for most of his administration the civil rights movement received only late and limited attention, and then only when faced with the terrible violence in the South. While the Democratic Platform of 1960 had promised concrete civil rights legislation, in his first two years Kennedy had offered mainly verbal support for civil rights.

Leaders of the civil rights movement were highly critical of Kennedy and his commitment to the black community. Kennedy was lacking in moral passion, said King. In their retrospective assessments of the administrations of Presidents Kennedy and Johnson, key members of the civil rights leadership said that both Kennedy's personal commitment to the cause of civil rights and his ability to effect the course of the struggle were considerably weaker than Lyndon Johnson's.

Whitney Young felt that President Kennedy did not have the confidence in the mood of the country for the passage of civil rights legislation that President Johnson did, and that, as a Southerner, Johnson was better able to understand the American people, and blacks in particular. Johnson was more encouraging of the March on Washington in August 1963 than was Kennedy, who was greatly concerned that it would get out of control and jeopardize the chances of the Civil Rights Act.[82] Civil rights organizer and activist Bayard Rustin believed that Johnson's administration was more committed to the black struggle for civil rights than any previous or subsequent administration. Disparaging the Kennedy Administration as "horribly overrated because I don't know what John Kennedy did on domestic questions that is so great, that he achieved," Rustin said that "Johnson was the best we've ever had."[83] James Farmer, founder and national director of CORE, saw that Johnson had a "strong belief" in civil rights, that his commitment was deep and sincere--"almost passionate"--and that he was able to push the legislation through in a way that Kennedy could not.[84] He felt that Johnson's record on civil rights before Vietnam intervened, "was excellent--the best of any President so far. There's just no question about that at all," Farmer said, "he battled it through." Farmer had "grave questions that Kennedy could have gotten the civil rights act through intact. But Johnson did, and he fought to get

it through." Johnson freely used the power of the office to bring pressure to bear to get the legislation passed, a failure for which Kennedy had been routinely criticized. When Farmer would visit with Johnson "he was on the phone, on the bill, and was cracking the whip. He was cajoling, he was threatening, everything else--whatever tactic was required with that certain individual, he was using." Farmer felt that Johnson was "the first Southern President since...Andrew Johnson... who felt that he wanted to go down in history as a person who really accomplished something in civil rights for blacks. I felt that, and I also felt that he personally meant it...."

To former NAACP director Roy Wilkins, Johnson will go down in history "as the man who when he got in the most powerful spot in the Nation...committed the White House and the Administration to the involvement in getting rid of the inequalities between people solely on the basis of race. And he did this to a greater extent than any other President in our history. It will take many, many Presidents to match what Lyndon Johnson did."[85] Johnson did what Kennedy would not do. "When the chips were down he used the great powers of the presidency on the side of the people who were deprived." Wilkins saw Johnson as absolutely sincere on issues of race and opportunity, and felt that Johnson's background equipped him to understand poverty, to understand people, and to understand the limitations race placed upon minority people in America. The Kennedy Administration, Wilkins felt, did not move fast enough on civil rights legislation, in part because he believed Kennedy did not know how to manipulate the government, as Johnson did, to bring it about. What was needed to get civil rights through was "precisely the qualities that Lyndon Johnson later exhibited, and which only Lyndon Johnson could have, by reason of his experience and his study and use of the materials of government."[86]

The New York Times was also attuned to President Kennedy's lack of obvious commitment to the black community. In its editorial pages, the Times badgered the president throughout his administration to get behind civil rights and use the weight of his office to support the struggle.[87]

Upon Kennedy's assassination, President Johnson moved into office bringing a sense of governmental direction and commitment to the cause of civil rights the American people had never before experienced. Everything in Lyndon Johnson's background and personality had made the vice presidency a nearly unbearable limbo for the wily Southern politician. Taylor Branch has described Johnson as having been "lifted from the torpor of the vice presidency," by the racial crisis confronting the Kennedy Administration, being suddenly "in demand again as the Senate architect of the only two successful civil rights bills since Reconstruction.[88] Although he was a Southerner, Vice-President Johnson's direction of the President's Commission on Equal Employment Opportunities as Vice President had shown the civil rights leadership his deeply felt belief in the goals of the commission. Roy Wilkins observed that "Johnson began to emerge during the Kennedy Administration wholly unexpectedly and to the delight of the civil rights forces...; he took a very personal concern on the fair employment business. He used the inevitable telephone...and he called all manner of people--unions and employers all over the country on the matter of increasing their employment of Negroes...."[89] Bayard Rustin again said that

Johnson was "deeply concerned" in this work and that he had been "tremendously beneficial" to the cause of civil rights in those days.[90] Whitney Young was impressed with Johnson's role in heading up the commission, "with what he said and the kind of people he was getting around him and the determination that he exhibited to make this a much more effective commission and to really do something."[91]

Immediately after Kennedy's assassination Johnson demonstrated his commitment to civil rights and the Civil Rights Act in particular. He began calling key black leaders within hours of assuming the presidency, and met with the top civil rights leadership within days, meeting with Martin Luther King, Jr., Roy Wilkins, and Whitney Young, among others.[92] As president, he acted instantly to move civil rights to the forefront of his domestic agenda. He felt that congressional inactivity in 1963 "resulted from lack of firm, determined, unrelenting leadership," and he intended to provide it.[93] Appearing before a joint session of Congress five days after Kennedy's death, Johnson pledged the nation's commitment to the "earliest possible passage of a civil rights proposal that would remove "every possible trace of discrimination and oppression" in the nation.[94]

Throwing his full weight behind the civil rights bill, Johnson did what few presidents have done, or been able to do, directly challenging the House Rules Committee by openly backing a discharge petition to pry the bill from the committee's dead hand.[95] There could be "no more dramatic sign" of the president's "determination on this vital issue" than his willingness to confront the congressional establishment by "openly backing the circulation of a discharge petition," said the Times.[96] Knowing from his own three decades in the House and Senate how odious such pressure from the president was to congressional leaders, Johnson stepped in to fill the government leadership vacuum in civil rights. The sparseness of Congress's record on minority rights had been often attributed to the "fact that the weight of the White House has seldom been brought fully to bear in civil rights debates."[97] Johnson did precisely that in immediately filing the rarely used discharge petition to move the civil rights legislation before Christmas.

Johnson was a New Dealer whose formative experience was in his National Youth Administration experience in the Texas depression.[98] His background--he was Southern and poor--his temperament--he was compulsive, energetic, driving, and perceptive--and his experience--he was a political genius, an expert at congressional politics, and a consensus seeker--uniquely shaped him for the moment of the 1964 Civil Rights Act. He was credibly committed to the cause of civil rights, to eliminating racism from American life, and to the black community.

While the Kennedy Administration had been unforthcoming in civil rights until it was inescapable, and had missed the opportunity to address the pressure for jobs coming from the black community in planning for the War on Poverty, Johnson was committed to racial equality and had established good, in some cases warm, relations with the black leadership. Furthermore, there is little doubt that Johnson would have liked jobs measures as an antipoverty program had that been the strong consensus of the Task Force planning the War on Poverty. Prior to Johnson's first State of the Union address, there was "something of the zeal and rhetoric of the old

New Deal days coming back into the pre-budget debate."[99] James Reston said that the president's cabinet spoke more of jobs and education than it had in months, commending Secretary Wirtz for publicly expressing what President Johnson had been saying in private. Schools were not preparing people for the jobs that needed to be done; job needs had changed, Wirtz pointed out at the University of Michigan, there were "no longer enough unskilled jobs to take up the school's failures."[100] Reston noted the increasing talk in the administration about emergency measures to attack poverty, "having a special program of education and public works...."[101] This was not new, Reston pointed out, but such measures happen "to fit President Johnson's approach to most problems."[102]

However, there was not a firm consensus on jobs in the Task Force, because the die was cast early on in the Heller phase of planning for the War on Poverty. Had Walter Heller's 1963 poverty planning committee under Kennedy been able to consider the idea of large-scale jobs programs as the central antipoverty strategy, the idea could have come through the Shriver Task Force period to be presented to President Johnson with forceful consensual backing. Walter Heller, when interviewed by Nicholas Lemann, observed that in the planning phase of the War on Poverty President Johnson was under the impression that the attack on poverty was to be organized like the National Youth Administration (NYA).[103] Heller said that Johnson envisioned "visible accomplishments." "He had this sort of concrete idea. Bulldozers. Tractors. People operating heavy machinery."[104] Likewise, Bill Moyers has said that, even after the Economic Opportunity Act was passed, Johnson thought the program was organized like the NYA.[105] But Heller could not accept the structuralist thesis and thus could not see the inescapable need for such measures in eliminating poverty, although Wirtz continued to struggle for jobs measures in the Task Force.

This analysis of the interplay of social forces in this critical period has shown that what also contributed to the failure of the idea of jobs policies was the halting and partial nature of the government's commitment to the civil rights leadership and the black community's struggle for full economic participation in the society, an issue of governmental will. Antipoverty planners believed we had the abilities and resources to eliminate poverty in American life. So did Martin Luther King, Jr. As King said, we had the tools and techniques, did we have the will?

The interests, thinking, and position of black elites on employment reflected important social forces that were brought to bear on antipoverty policymaking in the Kennedy and Johnson Administrations. Yet, although demands for jobs emerged from elites and other advocates from the black community, they were relatively powerless to affect the antipoverty agenda. Relative powerlessness calls attention to the ambivalent and ambiguous commitment of the national government to the genuine interests of black Americans in this era. Because the struggle for voting rights and civil rights in Congress and in the executive branch have become important national folklore, too little attention has been paid to how limited and unforthcoming the national commitment in general was to racial equality. Stories of Kennedy federalizing the national guard in Mississippi and Alabama, or of heroic

figures from the Justice Department like John Doar backing up the Southern struggle for political and civil rights, obscure the halting national response to the expressed needs of the black community for the means to economic participation--jobs.

Antipoverty planners, fully aware of the political climate in which they worked in 1963, were not wholly committed to racial equality. It was the year of headline civil rights campaigns in Birmingham, the bombings in that city, the March on Washington and increasing insurgency focused on jobs and employment in the nation's Northern cities, all events which pushed home the need to deal directly with pressure from the black community. Antipoverty planners were also aware that the debilities that accompany poverty--unemployment, poor health, nutrition, housing, and education for example--were more pronounced among blacks even though they did not constitute a majority of the poor population.[106] Furthermore, oral history records also document policymakers' awareness of active pressure from the black community. Yet antipoverty planners were especially concerned with the acceptability of an antipoverty program and in a sense played politics by dancing between their concern with the need to aid blacks because of the increasing pressure coming from the black community, their need to maintain the black vote, and their apprehensions about the 1964 reelection campaign. They also thought "that it would be death to bill any kind of program as a help-the-blacks program."[107] Yet, between 1961 and 1963 civil rights and related issues affecting the black community received high support in the country.[108] It was national public opinion that helped to turn around the intransigence of Southerners to integration and voting.

It would appear that antipoverty planners could have produced a critical program for black Americans. They could have directed the War on Poverty to the catastrophic need for employment in the black community. The limits of the program they imagined spelled the failure of any hope for realizing economic equality for most black Americans. There was ample evidence in the period that genuine equality would have called for major initiatives for employment in the black community. There was significant confirmation that jobs were critical from within government in the advocacy of jobs programs by Willard Wirtz and the structuralists in the Labor Department. Confirmation on the need for jobs also came from outside of government from the black organizations and their leadership as well as from the larger black community. So long as black demands could be confined to the realms of legal and political rights the costs of political and social conflict could be borne by government.

Thus, what continues to stand out sharply is how limited and equivocal have been the commitments of our presidents to genuine racial equality, an issue of governmental will. Lyndon Johnson, ironically as a Southerner, remains an exception to this as one who was paternalistic, but credibly committed to racial equality. Had there been consensus on the technical causes of unemployment and how it related to poverty, and had the Labor Department been able to administer a large scale jobs program--crucial "ifs," to be sure, by 1964 Lyndon Johnson was in place as a president who could have seized on the idea of jobs.

A Missed Opportunity: 1963 A Period of Social Opportunity

The important conclusion is that if there had been technical consensus among experts on the causes of unemployment and how unemployment related to poverty, and if the administrative capacity of the Labor Department had been adequate, then the stage would have been set for government to provide the emphatic sponsorship and social agency required for linking jobs to the eradication of poverty. But this did not happen. The case for jobs programs in 1963 was compelling; they were the right antipoverty strategy at that moment when planning for Economic Opportunity Act was underway. There were vigorous forces behind this; the supporting logic for this solution to poverty was sound; and there was a clear argument for it given the structural understandings of poverty in the Kennedy Administration that centered around the DOL.

The fact that jobs programs were not the central strategy had important consequences for antipoverty policy. First, had it had a stronger jobs component the War on Poverty would have been more politically viable in the long term than it was with amorphous experimental programs like CAPS at the center. Jobs programs--like the popular Manpower Demonstration and Training Act--were unambiguously related to the central domestic issues of the day--unemployment and civil rights, and popular support of a government guarantee to work was high.[109] Second, jobs programs were what the poor wanted. A major jobs initiative would have, in particular, been more responsive to the "Negro Job Crisis" and was called for by the civil rights leadership and other spokespersons. Third, if large scale jobs programs had been the centerpiece of the War on Poverty, the second and third generation effects on the US economy today might have been greatly reduced. We have an enormous problem with urban "ghetto" poverty today. Some of the best academic minds are engaged in research related to this problem. We know more now than ever about how programs do and do not work and about which programs work. Yet, the problems of American urban poverty are on such a gigantic scale today that it is almost impossible to imagine how they can genuinely be solved now with the resources we have. There has been much more social deterioration in the ghettos since 1963 and the dimensions of inner city poverty have changed enormously, as have social attitudes toward the black poor. It will be far more difficult today to arrive at the social consensus necessary to produce programs specifically targeted at the black poor. Some analysts say it is impossible.

It was not always like this. The point of my story--its significance so to speak--is that politically, economically, and socially in 1963 when this planning began was a rare occasion.[110] The failure of jobs policies in the case of the War on Poverty is important because we missed a critical opportunity. The point of entry into antipoverty policy in the early sixties was an opportune time to bring about large scale social change. We had an economy that permitted it. We had a window of opportunity in terms of policy making. We had the "right" president in Johnson with the largest majorities in both houses in Congress since 1937. And we had the right national mood (liberal and optomistic). Periods like this are rare.

We missed the opportunity then.

It is unlikely that the opportunity is present again today since having a democratic president in office is only one, albeit an important, variable. Today the economic factors are not favorable, and although we do have a democratic president in the White House, Bill Clinton is, thus far, without Johnson's talent and taste for either counting the vote or hand to hand conflict on Capitol Hill. In Spring 1993 President Clinton let a "bush league" Republican filibuster shoot down his proposed economic stimulus package for want of four votes, a scenario Lyndon Johnson would have never allowed to play itself out.[111] President Clinton--as governor and as presidential candidate--received advice from both Robert Reich--his Secretary of Labor--and Ira Magaziner on upgrading worker skills and made it a central part of his agenda. Reich and Magaziner have been on this topic for a long time and have finally gotten a heaven-sent opportunity to put some of their ideas into practice. Today, of course, they connect the goals of upgrading worker skills to our international struggle for competiveness and productivity. While this is a smart strategy in today's political climate, who knows how this will assist today's urban poor.

We cannot know if Clinton will continue to listen to his Secretary of Labor. Perhaps if Heller had heeded Willard Wirtz and if Johnson had paid closer attention to Wirtz we would be better off today. The structuralists had a good argument. While certain kinds of unemployment were reduced through increased growth, hard core joblessness was not. Poverty, which as people like Wirtz and other structuralists maintained was principally caused by the absence of a decent, steady income, could not be reduced without additional measures to create jobs and train people who did not have the skills for available jobs. In a sense Wirtz and the structuralists in and around the Labor Department "discovered" structural unemployment and prescribed large scale jobs policies nearly three decades ago, but the money and political support are not available today as they were in 1963.*

12. I examined legislative histories for numerous antipoverty and unemployment related acts in congress and the subsequent extensions and amendments to these acts throughout the Johnson years. I also examined leading journals of opinion and publicly available records of the antipoverty agenda. Content analyses of the New York Times revealed what the dominant ideas on the agenda were and helped to establish the public debate. I also interviewed at length former Secretary of Labor W. Willard Wirtz in Washington D.C. in July 1991 and August 1993 to obtain more direct information than is publicly available on his critical role in promoting jobs policies in the War on Poverty. Most revealing and useful was a thorough examination of archival materials and oral histories from individuals who were

instrumental in the development of antipoverty policy, economic policy, and jobs policy in the Kennedy and Johnson Administrations in the John Fitzgerald Kennedy and Lyndon Baines Johnson Presidential Libraries.

14. We only have Heller's word on this; the commitment is recorded in one of Heller's memoranda.

15. This was Senator Gaylord Nelson's proposal.

16. Wirtz interview, July 21, 1990. See also William Cannon's oral history interview by Michael L. Gillette, 21 May, 1982, tape recording, Lyndon B. Johnson Libray, Austin, Texas.

17. Weir, Politics and Jobs. Leon Keyserling, former chairman of the CEA, was an early, persistent, and penetrating critic of the peculiarly "American" adaptation of Keynesian ideas that characterized the Heller Council. See his oral history interview by Stephen Godell, 9 January 1969, Lyndon B. Johnson Library, Austin, Texas.

18. The idea was that reducing economic slack would increase the rate at which the economy took people out of poverty, presumably, bringing this rate up to the levels of the immediate postwar years when, between 1947 and 1957, the percent of families with less than $3000 total money income declined 10 points, from 33% to 23%. Heller was distressed that the present rate, from the years 1956 to 1961, was only two percent, from 23% to 21%. Lampman maintained that with a successful tax cut, full employment, and faster growth, the rate from 1957 to 1967 would fall from 19% to 14%, a rate similar to that of 1947 to 1957. See Memorandum, Walter Heller to Lyndon B. Johnson, 1 May 1963, "Progress and Poverty," Legislative Background EOA 1964 WoP, CEA Draft History of WoP, Box 1, Lyndon B. Johnson Library, Austin; Memorandum, Robert Lampman to Walter Heller, 10 June 1963, "An Offensive Against Poverty," Ibid.

26. For amplification of this point see J. Russell, The Making of American Antipoverty Policy: The Other War on Poverty, unpublished doctoral dissertation, Columbia University, 1992. Also see Weir's Politics and Jobs for a wider discussion of how particular patterns of decisionmaking went on to limit subsequent choices in this policy area.

27.Press conference of Willard Wirtz, October 10, 1963, President's Office Files (POF) Box 82, John F. Kennedy Library, Boston.

28.Ibid.

29. Ibid.

30.The economic logic of the CEA's target and its antistructural position has been played out in increasingly brutal terms as levels of unemployment up to today bear grim evidence James Tobin's early observation in 1964 that the economy had come to operate with increasingly higher levels of unemployment, "considerably higher than anything we had in the past, and it wasn't seen as abnormal or disburbing because of structural changes in the economy." CEA OH, 283.

31. See Chapter Four "Change and Incapacity in the Department of Labor" in J. Russell, The Making of American Antipoverty Policy for a fuller discussion of this point than that provided here.

32. Wirtz interview, 23 July 1991.

33. Wirtz interview, 23 July 1991. A fuller discussion of Heller's and the Council's relationship with Kennedy can be found in Chapter Three "Economic Ideas in the War on Poverty" of J. Russell, The Making of American Antipoverty Policy.

34.To strengthen its advocacy role for the unemployment policies it wanted, the department created a community of academic manpower experts. For the findings of the early stages of their research, see Knowledge and Policy in Manpower.

35. For some examples see the essays in Weir, Skocpol, and Orloff, eds., The Politics of Social Policy in the United States (Princeton: Princeton University Press,1988); See also Theda Skocpol and Kenneth Finegold, "Economic Intervention and the Early New Deal," in Political Science Quarterly Vol. 97 No. 2 (Summer 1982): 255-278; Stephen Skowronek, Building A New American State: The Expansion of National Administrative Capacities, 1877-1920(Cambridge: Cambridge University Press, 1982); Hugh Heclo, Modern Social Policies in Britain and Sweden (New Haven: Yale University Press, 1974); and Weir's Politics and Jobs.

36. Some of the following discussion draws from "The Administrative History of the Department of Labor during the Administration of President Lyndon B. Johnson", Volumes I and II (part 2), Lyndon B. Johnson Library. Henceforth this will be cited as "Labor Administrative History."

37. This office is referred to as the Office of Automation and Training in the Labor Administrative History.

38. By 1964 it was clear that automation and technology were not the real problems; the real problems were "the hard core, disadvantaged individuals, the individuals with low levels of education and training and individuals with less than eighth grade educations, individuals who were over forty-five years of age or minority individuals. Individuals who were on welfare or drawing unemployment compensation--these were the kind of people that it became evident that we had to shift to." Stanley Ruttenberg, interview by David G. McComb, 25 February 1969, tape recording, Lyndon B. Johnson Library, Austin.

39. Garth Mangum, MDTA: Foundation of Federal Manpower Policy (Baltimore: Johns Hopkins UP, 1968), 1. Mangum points out that the Act was highly popular in Congress, passing both houses with overwhelming bipartisan majorities, and it experienced an extraordinary absence of congressional

pressure for "results" allowing its administrators freedom to adapt the program to changing problems taught by experience. State and local governments, the public, and the academic community all evaluated the program positively.

40. HEW, which also had legal obligations mandated by the act, backed off because of lack of interest.

41. Labor Administrative History, 5.

42. The Service had 2200 local offices nationwide according to Stanley H. Ruttenberg and Jocelyn Gutchess, The Federal-State Employment Service: A Critique (Baltimore: Johns Hopkins Press, 1970), 1.

43. The Employment Service was close to the chairman of the House Subcommittee on Appropriations as was the Washington staff of BES. See Ruttenberg interview.

44. The Vocational Educational Act of 1963, the Youth Employment Act, administration of the MDTA and the developing antipoverty policy agenda in the White House and throughout the executive branch were measures that would involve USES. The passage of the Economic Opportunity Act of 1964 added the Neighborhood Youth Corps (NYC) to the Manpower Administration's inventory of jobs policies, but it was delegated to the Administration from OEO in the beginning.

45. See Cannon interview.

48. Stanley Ruttenberg was convinced that Johnson himself arranged for the Governors' Conference to protest the reorganization. See Ruttenberg interview.

49. Apparently Wirtz's resignation, which had been submitted to Johnson as had the resignations of other Kennedy appointees when Johnson succeeded Kennedy, could not be found.

50. For extended discussion of this misunderstanding between Wirtz and President Johnson, see Ruttenberg interview; James Reynolds, interview by Joe B. Frantz, 1 February 1971, tape recording, Lyndon B. Johnson Library, Austin; Clifford Clark, interview by Joe B. Frantz, 16 June 1970, tape recording, Lyndon B. Johnson Library, Austin.

51. Memo, Wirtz to Sorensen, 23 January 1964, 1.

52. Wirtz interview, 23 July 1991.

53. See Cannon interview.

54. Wirtz interview, 23 July 1991.

55. Although the economic orientation of the civil rights movement has been too often overlooked. See the work of Charles V. Hamilton and Dona C. Hamilton who have demonstrated the "dual agenda" of civil rights organizations in "The Dual Agenda of African American Organizations since the New Deal"

in Political Science Quarterly Vol. 107 No. 3 Fall 1992, and elsewhere.

56. William Capron at the Conference on Poverty and Urban Policy, sponsored by Brandeis University and the John F. Kennedy Library, Conference Transcript of 1973 Group Discussion, p. 182. The oral history records from the Brandeis Conference suggest that there was little direct link between the civil rights leadership and the War on Poverty, which is an interesting fact in itself. Hereafter, reference to this conference will be made by the speaker's name and "Brandeis Conference".

57. Chapter Two of the President's Economic Report 1964. William Capron has said that the significance of this chapter was ignored by antipoverty planners in the period. See the transcript of the Brandeis Conference.

58. Chapter Two of the President's Economic Report, 1964.

59. Charles Killingsworth, "Negroes in a Changing Labor Market," in Arthur M. Ross and Herbert Hill, eds., Employment, Race, and Poverty (New York: Harcourt, Brace, and World, Inc., 1967) 49-75. The following two paragraphs draw on Killingsworth's analysis. More recent analyses of the dimensions of black unemployment have been done by William Julius Wilson, for example. See The Declining Significance of Race and The Truly Disadvantaged. Killingsworth's work on the labor market is used here because it was available in the period under study as was that of Arthur Ross and Herman P. Miller, an expert on income distribution. See Miller's Poverty: American Style (Belmont, CA.:Wadsworth Publishing Co., 1966) and Rich Man, Poor Man (New York: Thomas Y. Crowell Co., 1964).

60. Killingsworth, ibid. Killingsworth cites four factors that had serious consequences for black employment in the post war period. First, after the end of the Korean War, the drop in defense spending eliminated many of the less skilled jobs in manufacturing that blacks had held previously. Second, although defense and space raised government spending in the 1950s, the ensuing jobs were much different from the low skilled jobs in defense related industries during WWII, requiring special construction and engineering and scientific expertise. Third, in the non defense industries the job mix also changed with a downturn in the number of blue collar jobs, especially low skilled jobs, and a rise in white collar jobs. Fourth, plant decentralization meant that new plants were built away from the former centers of manufacturing in the north central and northeast markets and near the new markets in the south and the west. And while employment was rising in newly emerging service industries, they were growing less quickly in the older industrial centers of the country where black job seekers had relocated.

61. Killingsworth, 57.

62. Ibid. Adjusted white rates are not offered by Killingsworth although hidden unemployment would presumably increase among whites as well when white unemployment rates are up.

63. Arthur M. Ross, "The Negro in the American Economy," in Ross and Hill, 33.

64. John C. Donovan, The Politics of Poverty Third Edition (Washington, D.C. University of American Press, 1980) 102.

65. Nonwhite female unemployment ratios were close to those of nonwhite males when considered by age except those for teenagers, which were consistently and considerably higher for females. Although hidden unemployment among nonwhite females was difficult to measure, it was understood that there was considerable hidden unemployment among nonwhite female teenagers. While rates for white teenage females had risen in the sixties, those of nonwhite teenage females had fallen dangerously in the fifties and sixties, and their reported rate of unemployment was the highest of any group by age, sex,

or color. By the end of the sixties, it had reached 30 percent. This information is from Killingsworth, 27.

66. The information in this paragraph is from Whitney M. Young To Be Equal (New York: McGraw-Hill, 1964), 54-55.

67. At a 10 a.m. private meeting with Labor Secretary Willard Wirtz on the morning of the march, Martin Luther King pressed for jobs for black youth. In their discussion, King expressed no interest in discussing the upcoming civil rights bill and, in fact, deflected Wirtz's efforts to discuss the act to push for the summer jobs component of the Labor Department's two part program. Wirtz interview, 23 July 1991. The second part of the program was job training. King's interest may have been a function of his need to be of relevance to ghetto youth as he tried to bridge the gap between his centrist stance and the impatience of activists in the movement. This stance became especially pronounced after his humiliating failure to affect the power structure in Albany Georgia in 1962, a failure which was followed by increasingly harsh criticism of King.

68. Young, 29.

69. First proposed by Randolph during the White House Conference on Civil Rights, the budget was put together by Bayard Rustin overseeing the work of a mixed black and white group of economists and policy analysts which included John Kenneth Galbraith, Michael Harrington, Leon Keyserling, Vivian Henderson, and Tom Kahn. See Charles V. Hamilton and Dona C. Hamilton's "Social Policies, Civil Rights, and Poverty" in Shelton H. Danziger and Daniel H. Weinberg, eds., Fighting Poverty: What Works and What Doesn't (Cambridge: Harvard University Press, 1986) 298-300.

INTERNATIONAL AID AND THE PRIVATE SECTOR IN THE CZECH AND SLOVAK FEDERAL REPUBLIC[1]

Peter Rutland

Government Department
Wesleyan University
Middletown CT 06459

Paper prepared for the annual conference of the American Political Science Association, Washington D.C., 2-5 September 1993.

Introduction

International assistance for the transition economies is a topic of central importance, with billions of dollars of funds being allocated to the construction of market economies in the post-socialist zone. It is widely accepted among academics and politicians that such aid is a Good Thing. Even conservatives, reluctant to see government money being spent for any purpose, are torn by a desire to help ensure the transition to private enterprise in the post-socialist economies.

However, one can argue that while Western countries share a rhetorical commitment to privatization and democratization, in practice their policies do not amount to a coherent assistance program, and underlying disagreements in political philosophy and economic interest are disguised behind the veneer of ideological unity.

Initially, attention focussed on stabilization programs, in recognition of the vital role of a stable currency in the creation of a market economy. The record with stabilization has been mixed: success in some small to medium countries (Estonia, Czech Repulic, Kyrgystan, Hungary, Poland, and perhaps Latvia and Slovenia), but a failure in the large countries (Ukraine and Russia) and in some small countries (Bulgaria, Romania). The successes are not unadulterated triumphs: in most of them inflation is still running at 30-40% for 1993. Also, critics such as G. Kolodko make the argument that such price stabilization as has been achieved can be attributed primarily to the collapse in output.[2]

There was a clear pattern in the cases of successful stabilizations. A small team of technocrats, aided by the IMF, moved quickly to introduce a stabilization program while political forces were either in disarray or briefly united behind the need for radical economic change. If governments failed to move quickly, and allowed political coalitions to build up with a vested interest in continuing inflationary emissions, then stabilization became much more difficult.

Attention has now shifted from stabilization to privatization as the main focus of international assistance - partly, one suspects, because the struggle to stabilize the Russian economy has proved so intractable. Hence President Clinton's commitment in April 1993 to focus the bulk of Western aid on the emergent private sector in the former Soviet Union. However, privatization has proved even more difficult to introduce than stabilization in the post-socialist economies, since the political, economic and technical barriers seem more obdurate.

However, despite the best of intentions the global economic recession and budgetary problems in many Western countries mean that large scale transfers of resources to rebuild Eastern Europe are not going to occur. On paper, since the 1989 Paris summit no less than $23.4 billion has been verbally committed by more than 30 countries and international organizations, rising to $33.8 bn if one includes the IMF and World Bank. However, in 1990 (the last year for which aggregate estimates are available) only some 11-13% of this assistance was actually spent.[3] The disbursement rate varied from 27% in Poland, 16% in Hungary, and 4% in CSFR. UK aid disbursement was among the highest, at 60%, while that of the USA was among the lowest, at 6%. Actual spending on a per capita basis between 1989 and 1991 amounted to $795 in Hungary, $545 in Poland ($305 if one excludes debt relief), and $310 in Czechoslovakia. In 1992 loans from international institutions to Czechoslovakia totalled $897 mn: IMF $284 mn, World Bank $331mn, EC $232 mn, and G24 $50 mn.[4]. Direct foreign investment between 1990 and June 1993 amounted to $1,868 mn in the Czech Republic and $320 mn in Slovakia.

Opening the doors to greater trade flows has proved politically controversial. The small print in the associate member status negotiated with the EC by Poland, Hungary and Czechoslovakia in December 1991 envisioned the gradual elimination of tariffs and quotas over five years, but allowed for strict limits on steel, cement, textiles and food - precisely those commodities in which East Europe arguably has a comparative advantage. Such limits were

imposed on steel exports to the EC in November 1992.

Desite the relative modest amounts of cash made available, and despite the limited access to Western markets, the desire to help remains. Into the breach has stepped the concept of technical assistance.[5] The least the West can do, the argument goes, is to share its expertise on how to run a capitalist economy. Surely few could object on political or economic grounds to such programs, within either the donor or host countries? The impact of technical assistance programs is difficult to study and hard to measure, but it seemed interesting to explore the extent to which the rhetoric of international assistance measured up to the concrete needs of entrepreneurs in what is arguably the most successful of the economies in transition, the Czech and Slovak Republics.

THE TRANSITION TO CAPITALISM IN CZECHOSLOVAKIA

The former Czechoslovakia is a good case to study the feasibility of international assistance for private sector development. Alone among all the post-socialist economies, it has succeeded in implementing a program for the mass privatization of large state industry. It has the most comprehensive program of small privatization in the region (the auctioning of stores and workshops), and has also shown impressive growth in new private enteprise start-ups. And all this progress comes in a country which had the smallest private sector in East-Central Europe prior to 1989.

Yet an examination of the Czech and Slovak cases reveals that international assistance has been of limited importance in their economic transformation. IMF technical assistance and a $1,250 mn standby facility was helpful in effecting the January 1991 price liberalization and currency devaluation, which were the decisive steps of the post-communist federal government. Increasing direct foreign investment, export surpluses and bonds floated on international markets enabled the Czechoslovak government to decline later loan tranches in 1992.

The key variables in the Czech case were strong political leadership from Vaclav Klaus (Finance Minister and subsequently Prime Minister) and a robust social consensus behind market reform.[6] The importance attached to a stable currency, trade liberalization and privatization have deep roots in Czech culture and history. Among these roots, ironically, was the very strength and orthodoxy of the communist regime in Czechoslovakia since 1968. This had the effect of discrediting leftist policies and political movements, leaving the field clear for the center-right. The preservation of Stalinist central planning through the 1980s also meant that Czechoslovakia did not inherit the troubling legacies left by the abortive market reform efforts of Poland and Hungary - inflation, foreign debt, and mobilized labor unions.

Slovakia was pulled along by the federal government's reform program in 1991-92, but because of differences in industrial structure unemployment rose to 13.2% in Slovakia while remaining below 3% in the Czech Republic. The differential impact of the reforms exacerbated the Slovaks' desire for cultural and political parity with Prague, and led to fierce bargaining over budget subsidies. These processes came to a head in the June 1992 elections, which left Klaus's Civic Democratic Party victorious in the Czech Republic and Vladimir Meciar's Movement for a Democratic Slovakia in the eastern republic. The federation split on 31 December 1992, and since then the reform process has ground to a halt in Slovakia, where the deficit rose above 10% of GDP.

These developments have increased the prominence of outside agencies, and in 1993 the IMF emerged as a key player, pressing the Slovak government to stabilize the economy. The IMF approved a $90 mn Systemic Transformation Facility for Slovakia in June 1993 (after an abortive mission in February), but tied this to a fiscal deficit of no more than 5% of GDP and the devaluation of the Slovak crown. The crown was devalued by 10% - less than the IMF recommended - and an import surcharge of 20% was introduced. Prime Minister Meciar, formerly an opponent of international interference in Slovakia, now cites IMF support to justify his policies.

INTERNATIONAL ASSISTANCE PROGRAMS IN CZECHOSLOVAKIA

To what extent did international assistance reinforce and accelerate the domestically-generated reform movement in Czechoslovakia? In order to examine this question, the author conducted fieldwork in 1992 to study the impact of international aid on the development of the private sector. (The role of international advisors in the privatization of large industrial enterprises was excluded from the study.) Some two dozen interviews were conducted with key officials in the Czechoslovak ministries and foreign aid agencies, and 14 business advice centers were visited.

While most Western advisers are themselves positive and enthusiastic about their work in the post-socialist countries, East Europeans themselves have rather mixed reactions to the numerous assistance programs being mounted on their behalf. There are frequent complaints about the 'Marriott syndrome': international experts, public and private, who jet in for a few days at a time to offer their advice, with little awareness of local conditions. There is a widespread feeling that the lion's share of funds allocated for assistance programs disappears into operating expenses. Some international consultants charge $2,000 a day: the lowest fee reported was $400 a day.

Another complaint is that many international programs are slow to disburse funds. Many operate on a committed funds basis, without precise time limits, which means that once the money has been allocated there are few direct incentives to spend it quickly. A counter-example is provided by the UK Know How Fund, which operates with a strict annual budget. This means that money not spent in a given year cannot be rolled over, which provides an incentive to spend funds promptly.

Also, many international programs have been slow to get into operation, taking months or even years to recruit and install their management teams. The economic situation is changing so rapidly that it often happens that by the time the program begins the

problem originally targeted has been superseded by some other issue. Alternatively, by the time the program gets under way some other group may have stepped in to tackle the problem.

Another common problem was that most of the international organizations preferred to piggy-back on Czechoslovak government programs. This may make good sense, in that the government can in principle provide premises, personnel and legitimacy. Also, international aid cannot be sustained indefinitely, and is thus best seen as a pump-primer. One can expect that after two or three years the funding will be withdrawn, and after that the projects will either have to become self-financing (through user fees) or be paid for by central or local government.

However, this approach of channelling international aid through governmental ministries does have certain drawbacks. The Czechoslovak government budget was under pressure and there were few funds available to support new programs. Thus many of the international initiatives were held up due to lack of money (or commitment) from the Czech and Slovak side. Another drawback is that the international program may inadvertently sustain certain bureaucratic agencies which were otherwise out of a job after the collapse of central planning.

A further criticism of these programs is that they overlap and duplicate each other's work, with little attempt at coordination. This should not perhaps be judged too harshly. Competition between rival providers is to be preferred over some sort of effort to impose central coordination, with a governmental agency picking and choosing between alternative projects. (Although both the federal and republic economics ministries did actively seek to play a coordinating role - without much success.)

Differences in approach

One can distinguish clear differences in the modus operandi of the various international programs. The American presence is highly visible, and consists of a combination of well-funded US government sponsored programs on one side, and a host of small, aggressive private operations, often staffed by enthusiastic and idealistic volunteers, on the other. Both the US government and private initiatives tend to shy away from formal collaboration with Czechoslovak governmental bureaucracies.

The European approach is more low key, and almost entirely governmental in origin. There are also two faces to the European approach. On one side is the Phare program (Poland-Hungary Assistance for Reconstruction of the Economy), sponsored by the European Commission: large, well-funded, and attempting to build a national system in close cooperation with Czechoslovak ministries. At local level, however, one finds many bilateral initiatives from local authorities and Chambers of Commerce in Italy, Germany, Holland and Austria. The British pursue an intermediate approach. Their Know How Fund is government financed but entrepreneurial in style, awarding grants to a host of local initiatives through open competition.

Looking beyond the area of small business, the various international donors also differ in emphasis with regard to the themes of primary interest. The US has spent its money on sending merger and acquisition dealers to advise on large-scale privatization, while the British have sent some of their top people in combatting regional unemployment and training local authority managers. The EC in turn has shown particular interest in promoting high technology.

It is difficult to evaluate the impact of international assistance in Czechoslovakia. Many of the programs visited in 1992 had not yet started full operations, and those that had rarely provided detailed data on the number of clients reached, or evidence as to the impact of their programs.

The major assistance programs

The EC's Phare program was extended to Czechoslovakia in 1991. Phare spent ECU 34 mn in Czechoslovakia in 1991, of which 30 mn went on environmental projects and 4mn on education. In April 1992 Phare allocated ECU 99 mn to Czechoslovakia, to be distributed as follows: 20 mn for small and medium enterprises (SMEs), 15 mn for labor market policy, 5 mn for the environment, 5 mn for energy, 6 mn for telecommunications, 9 mn for the Tempus education program and 20 mn for general purposes. Of the 20 mn for SMEs, 7.5 mn will go into guarantee banks and 4.5 mn to the Federal Ministry of Labor for loans in high unemployment areas. By April 1993 Phare commitments had risen to $144 mn and disbursements to $33 mn.

The Phare small business program started in January 1991, and is run under contract by three Irish executives. It has two major components: consultancy and finance.

On the **consultancy** side, ECU 8 mn will be targeted on creating a network of business incubators (BICs), with a focus on high technology projects. connections to local technical universities. In addition there will be a network of regional advisory and information centers to aid starting entrepreneurs.
Phare will provide equipment and training, although the local council have to provide premises and cover running costs. Some centers are being sponsored by regional chambers of commerce from EC member states.

As for **financial assistance**, Phare has allocated ECU 10 mn to a small loans scheme, which will provide loans up to Kcs 300,000 ($10,000), with up to 90% guaranteed against default. Phare is putting a further ECU 2 mn into the Czech/Moravian and Slovak Guarantee Banks (which provide a 70% guarantee). As with the SME program, there is a heavy emphasis on training.

The main problem Phare has faced has been finding suitable Czechoslovak partners through which to run their programs. The team was initially placed in the Federal Ministry of Labor and Social Affairs, which was liquidated in September 1992. Similarly, their

banking program found it hard to find local partners. The largest Czechoslovak banks, such as the Czech Savings Bank, declined to take part, presumably because they wanted to concentrate on other activities which they judged would be more profitable than lending to SMEs (most notably, the lucrative voucher privatization of large-scale industry). In the end, Phare signed a cooperation contract with the small Bank of Bohemia, a private bank which has only 14 branches.

The UK Know How Fund has disbursed roughly $17 mn in Czechoslovakia since starting operations in early 1991. Their mode of operations is to solicit a broad range of proposals, with a preference for small-scale local initiatives: booklets on how to set up a business, a job creation project in the mining district of Ostrava. They have concentrated on employment initiatives and health and safety matters, and have spent $1.5 mn on management training.

The US Agency for International Development is the primary source of funding for the following programs (in addition to educational exchanges):

- the Czech and Slovak American Enterprise Fund;
- the International Executive Service Corps;
- the Financial Services Volunteer Corps, which is similar to the IESC, but places financial visitors, not manufacturing industry executives;
- the MBA Enterprise Corps; and
- Volunteers for Overseas Cooperative assistance, providing advice to farmers.

Small business promotion has not been a priority for AID. Most of the $55 mn it has spent in Czechoslovakia has gone on funding technical studies in the fields of energy, telecommunications, health care and environmental improvement. $10 mn has been spent on providing 20 advisers (mostly former Wall Street merchant bankers) for the Ministry of Privatization, analyzing proposals for the large industry privatization program.

Education has also been high on the AID agenda, although they have concentrated on advanced training rather than entrepreneurial advice. AID funds the CERGE MA and PhD programs at Charles University (run in conjunction with the University of Pittsburgh) at a cost of $900,000. $400,000 has been allocated to bank staff training, and $700,000 assistance to the Prague Economics University. AID has provided $1 mn to the Czechoslovak Management Center in Celakovice, mainly to cover short courses for executive retraining. The CMC also received a $400,000 grant from the Canadian Government for small business promotion, in the form of seminars for Czech entrepreneurs - in competition with the BICs being established through the Phare program.

The Czech and Slovak American Enterprise Fund was established as a private corporation in March 1991, under the US Support for East European Democracy Act of December 1990, which allocated $300 mn over three years to help the emerging democracies of East Europe. The fund has been allocated $65 mn over three years by AID, of which $20 mn has been disbursed, to about two dozen projects. Their first loan was made in October 1991: $64,000 to a bakery with 20 employees in a Prague suburb. The fund has also spent $5 mn on technical assistance programs, such as the MBA Corps and the Central European Institute. Its operating expenses were $543,500 in its first 7 months.

The IESC arranges short placements for experienced (mostly retired) US executives, and have arranged for 100 visits since opening in January 1992. Their operating costs, and the air tickets of volunteers, are paid for by AID. The local client must provide accommodation and living expenses, which can be a burden for smaller clients. The MBA Enterprise Corps has placed 40-50 young volunteers from US business schools.

Various other international organizations have become involved in the promotion of the private sector. The first on the scene, in January 1991 was the International Labor Organization which launched a 'Women in the labor market' program with $250,000 funding from the Dutch government.

Small business programs in the Czech Republic

The Czech Republic spent K2,105 mn to assist SMEs in 1991, mostly channelled through the republic Ministry of Economic Policy.[7] 23 business advisory centers are being set up under the auspices of the Phare program, and with the assistance of the Association of Research and Industrial Parks.

In April 1992 the Czech parliament passed an Act on State Support for Small and Medium-Sized Enterprises.[8] The new act confirmed the creation of the Czech-Moravian Guarantee and Development Bank, and allocated K1.9 bn base capital for 1992. The bank underwrites loans made by Czech banks to private entrepreneurs, up to a maximum of 70% of a given project. The Act also established four programs providing financial support (credit guarantees and interest subsidies) to SMEs, with a preference for projects located in high unemployment regions, or involving new technology.

Small business promotion in Czechoslovakia has been closely tied to the development of active labor market policies to deal with the looming threat of unemployment. In most OECD countries 40-65% of jobs are in firms with less than 50 employees, and two thirds of all jobs are in the service sector. In Czechoslovakia as of 1989, only 20% of the workforce were employed in services, and less than 5% were in firms with less than 100 employees. Clearly, Czechoslovakia faces a massive shedding of labor from large industrial plants - and where else can these jobless be soaked up if not in the small business sector?

In the space of three years Czechoslovakia has moved from an economic system with zero open unemployment to one with a jobless rate of 2.7% in the Czech Republic and 12% in Slovakia. Active labor market policies kept about 225,000 workers off the unemployment rolls in 1992, through training programs, subsidies for short time working, etc.[9] In 1992 K1,722 mn was spent on active labor measures, and K1,650 mn is planned for 1993 (compared to K1,423 mn and K3,850 mn on unemployment benefits). Much of the

Western assistance has emphasized the importance of retraining for the unemployed, although this may be more a reflection of the needs of mature Western labor markets than of Czechoslovak conditions.

Small business programs in the Slovak Republic

Economic developments in Slovakia are weighed down by three factors. First, the rapid industrial growth of the past 30 years created a host of new, single-industry towns which were heavily dependent on the Soviet market. Trade with the former USSR collapsed in 1990, and unemployment has reached 20% in many of these towns.

Second, the unbalanced structure of the Slovak economy combined with its relative geographic isolation from the core of Western Europe means that the bulk of incoming direct foreign investment went into projects in the Czech Republic.

Third, political uncertainty over the future of Slovakia in the wake of the June 1992 elections has stymied the actions of the Slovak government and has scared away many potential foreign investors.

Aware of the looming challenge of mass unemployment, in late 1991 the Slovak government decided to fund Entrepreneurship Consultancy Centers in each of Slovakia's 38 regions, to be administered by the regional council. The government would provide basic office equipment and funding for two staff for each center.

THE RE-EMERGENCE OF THE PRIVATE SECTOR IN CZECHOSLOVAKIA

Unlike Poland and Hungary, Czechoslovakia had a minuscule private sector prior to 1989 - equal to less than 1% of GNP. Since the revolution it has experienced explosive growth, rising to 5.1% of GNP in 1990, 8.3% in 1991 and 21.5% by the end of 1992.[10]

Restitution laws passed in October 1990 and February 1991 have

seen 50,000 property units returned to their former owners. Restitution is physical except in cases where the property had been rebuilt, in which case monetary compensation is paid. February 1948 was established as the cut-off date for restitution to avoid arguments over the legitimacy of the seizure of property belonging to the 2.5 million Sudeten Germans who were expelled from the country in 1945. Restitution only really affects housing and small businesses: by 1948 the non-communist Benes government had already nationalized 86% of industrial assets.

Separate laws were passed in 1991 covering the restitution of land. Transformation Councils have been set up in each state and collective farm to supervise the return of land to individuals (although less than 10% are likely to exercise this right) and the creation of smaller cooperative farms. The Councils can potentially play an important role in resolving social conflicts in the countryside in a non-judicial manner, and are an example of the decentralization inherent in much of the Czech approach to privatization.

A law on 'small privatization' was passed on 25 October 1990, introducing the idea of selling shops, cafes and workshops through public auction. The first auctions took place on 26 January 1991. First round auctions were limited to resident Czechoslovak citizens: foreigners could participate in second round auctions if no bidder reached the minimum price in the first round. Units were not sold outright, but were leased for three, and later five, years. By January 1993 in the Czech Republic 22,004 units had been sold of the 32,000 designated, raising K29 bn, and 9,676 in Slovakia, for K14.5 bn.[11]

Thus restitution and privatization auctions have allowed new private entrepreneurs to gain access to premises at low cost, and 45% of retailing is now in private hands.[12] Leasing carries certain disadvantages in comparison to outright sale:

- it preserves a role for state officials, monitoring the lease terms;
- it limits the scope for the emergence of a capital market;

- most leases lock the property into its current use; and
- it lowers the incentive to invest in capital improvements.

The advantage of leasing is that less capital is required to bid for a five-year income stream than for outright ownership of property. (Lack of start-up capital is indeed one reason why leasing of equipment has proved more common than franchising.) However, for the very same reason banks will be more reluctant to lend for a lease than for an outright purchase.

Restitution and privatization auctions have been important in allowing new private entrepreneurs to gain access to premises at low cost - although an extensive survey of new entrepreneurs conducted in 1992 showed only 13.2% had acquired their premises through these methods. Thus despite the poorly developed nature of the real estate market, there is little evidence that access to premises has been a serious hurdle for Czechoslovak entrepreneurs.

THE RATE OF EXPANSION OF THE PRIVATE SECTOR

According to a poll conducted by the Public Opinion Institute in early 1992, no less than 9% of the adult population in the Czech Republic and 4% in Slovakia were registered as private entrepreneurs.[13] The sheer number of private entrepreneurs speaks highly of the two nations' commitment to and belief in the viability of a market economy. However, the spawning of this host of micro-businesses has not yet had a decisive impact in arresting the downward slide of the Czech and Slovak economy - although it probably helps to explain why unemployment has not risen at a rate commensurate with the decline in output.

The number of registered private entrepreneurs rose dramatically from 24,000 in 1985 to 75,000 at end 1989, 294,000 at end 1990 and 1,241,000 at end 1991.[14] By January 1993 there were 1,201,800 in the Czech Republic and 301,000 in Slovakia.[15] 24% were in manufacturing; 21% in enterprise services and real estate; 19% in construction; and 17% in retailing and consumer services.[16]

In addition to registration as 'physical persons',

entrepreneurs could also register as legal persons ie. firms. There were 16,885 private firms in July 1992, up 4,736 since January. Of these, 4,198 were in Slovakia.[17] The 4,614 registered private firms in operation at the end of September 1991 employed 32,858 workers.[18]

To have 1.5 million registered entrepreneurs out of a total workforce of 7.2 million is a remarkable development. Less clear, however, is the extent to which these entrepreneurs are active and productive participants in Czechoslovakia's economic recovery. For the first time, in August 1992 systematic data about the level of activity of this army of entrepreneurs became available as a result of a survey by the Federal Statistical Office (see next section).

The rate of growth of private individual entrepreneurs eased after September 1992, when new rules were introduced requiring would-be entrepreneurs to demonstrate on average three years' practical experience in a profession before they can be registered to practice in that field.[19] Also, the new Accounting Act increased the registration fees, while tax regulations were tightened to limit the explosion of sub-contactors, particularly in construction. This was fueled by the fact that individual entrepreneurs were exempt from the 50% payroll tax. (Hiring of entrepreneurs as sub-contractors is now limited to a maximum of three months.)

Full-time employment in the private and cooperative sectors together rose from 1.3 mn in 1990 to 2 million in 1991, which amounts to 29% of the country's 7.2 million workforce. Of this, 16.4% were in the private sector and 12.0% in cooperatives.[20] It is hard to tell how many of these are new jobs, and how many have simply moved across from the state sector (not that the latter is necessarily less desirable than the former).[21]

According to official estimates the private sector in Czechoslovakia generated Kcs 79.3 bn or 8.1% of GDP in 1991, up from 4.1% in 1989 and 5.3% in 1990.[22] In other East European countries (such as Poland) reform advocates complain that official figures are failing to register the boom in private businesses. One

hears few such complaints in Czechoslovakia, and anecdotal evidence suggests that while unregistered activity is present to some extent in retailing, aggressive state officials keep under-reporting of manufacturing activity to a minimum.

In 1991 inndividual entrepreneurs accounted for 42% of private sector output (K33.7 bn), and private firms the remainder. In the Czech Republic by the end of 1991 the private sector accounted for 3% of industry, 6% of transport, 11.5% of agriculture, 14% of construction, and 24% of retail trade.[23] However, by May 1992 state enterprises still accounted for 90.8%, falling to 83% as of July 1993. In June 1992 the first wave of voucher privatization began for large state-owned enterprises, and about 25% of state firms have now been converted into joint stock companies, but in many of them the state still holds a controlling share.

In the first 5 months of 1992 the private share of retail sales rose to 44%.[24] Private companies also accounted for 52.1% of retail imports and 40.8% of consumer goods exports.[25] The boom in tourism (66 mn visitors in 1991) also fed the growth of private business: 80% of the country's 3,500 travel agencies are privately owned.

This progress for the private sector came against a general background of economic decline. GDP was K977 billion in 1991, down 15.9% over 1990 in real terms. The number of registered workers fell 15.4% in the first 5 months of 1992 compared to the same period in 1991. Even the number of workers in the private sector contracted by 3.8%.[26]

The situation in manufacturing industry continues to give cause for concern. In June 1992 there were 2,175 industrial firms in the Czech Republic with more than 25 employees, of which only 406 were private and 245 cooperatives. There were an estimated 240,000 with less than 25 employees.[27] As the tables in Appendix One show, output in private manufacturing firms actually <u>fell</u> between 1992 and 1991, albeit at a slower rate than in state-owned firms. Private sector output was down 13.4% in the first five months of 1992, while private manufacturing employment fell 6.6%.

(The figures show deceptively rapid growth in Slovakia, because this was growth from a very small base.)

Financial support for small businesses

There has been much debate in Czechoslovakia over the extent to which lack of capital has been a crucial factor in holding back the development of the private sector.

The commercial banking sector is developing quickly, but from a very low base. Bank branches have little autonomy, and typically cannot approve loans of K500,000 ($18,000) or more without clearance from head office. Banks are often accused of being very conservative in their lending policies, for example demanding collateral worth 150-200% of the value of the loan.

In response, officials of Komercni banka argue that they approve 30% of applications submitted to them, and that private sector loans have risen from 4 to 8% of their total lending. They argue that most private entrepreneurs simply do not present coherent and viable business plans, and the banks cannot lend money to individuals without collateral or a proven credit history (which few possess, given the nature of the pre-1989 economy). The major Czech and Slovak banks are currently being privatized and are radically overhauling their operations, while several dozen new private banks have been founded. But it will obviously be some time before the effect of these changes will be felt.

In response to these criticisms, the Slovak and Czech-Moravian Guarantee and Development Banks were founded in late 1991. These guarantee banks are modelled after similar institutions in France and Austria, and are quite different from the orthodox development banks to be found in the Third World which lend money directly to favored projects. The guarantee banks merely underwrite commercial bank loans to private entrepreneurs, to a maximum of 70%. The idea is that this encourages banks to take on more risky loans, although critics argue that a guarantee bank removes the incentive for banks to learn how to evaluate risk and how to turn commercial lending

into a profitable business.

Total credits for the private sector rose from K64 bn in 1991 to K126 bn in the first half of 1992.[28] This was still only 17% of total loans, however, meaning that state firms continued to receive the lion's share. While only K4.4 bn went to entrepreneurs in 1991, in 1992 K26 bn was lent to finance leases purchased under the small privatization program.

Ironically, the government's strenuous efforts to restrict the growth of the money supply and hold the government deficit down to 2% of GNP hurt the private sector just as much as state industry. The government relied on crude credit limits to control the money supply, and not the interest rate, because of the inadequately-developed money market. An IMF report criticized the over-conservative credit policy being pursued by the mostly inexperienced banks, arguing that 'While the tight stance of credit policy helped avoid the onset of an inflationary spiral it may have added initially to the weakness of demand and the contraction of output.'[29]

Private business is held back not only by the absence of available capital, but also by the lack of an existing local network of lawyers, accountants, etc. to offer advice and support. Access to information about banking facilities and government programs is still rather haphazard, with a heavy reliance on word of mouth. The banks themselves have little of no experience in dealing with small entrepreneur borrowers, nor do they seem to see such lending as an area in which it will be profitable to expand. However, the private sector itself is proving increasingly adept at meeting the needs of new entrepreneurs for information and advice. As of June 1992 there were 230 private consultancy firms, and a new commercial journal, 'Advice for Entrepreneurs'.[30]

Both the European Community and the US government put a lot of money and effort into trying to promote small loans programs for businesses. However, there is little proof that access to capital was really a crucial barrier to new entrepreneurs - while there is plenty of evidence that it was premature to expect the banking

system in these countries to be able to take on the new task of lending to small businesses.

Some of this banking assistance may actually have been counter-productive. The creation of a Guarantee Bank in the Czech Republic, for example, as promoted by the EC's Phare program, reduced the incentives for Czech banks to learn how to evaluate business plans (since it lowered the risks resulting from bad decisions). And to a degree the US Czech and Slovak Enterprise Funds may have served as unwelcome competitors to indigenous banks, 'cherry picking' the best projects and leaving local bankers with a less attractive loan portfolio.

EVALUATING THE PROSPECTS FOR THE PRIVATE SECTOR

In January-February 1992 the Public Opinion Institute, part of the Federal Statistical Institute, conducted a massive sample survey of registered private entrepreneurs. The names of 10,000 persons registered as private entrepreneurs were selected from the register, in all regions of the country, of which 5,726 were interviewed (25% in the Slovak Republic). The survey was limited to those registered as 'physical persons', and excluded private firms and private farmers.

75% of the respondents said they were active as entrepreneurs in 1991, while 31% had been active in 1990. Only 7% of the businesses had been registered prior to 1989. They were mostly one-family operations: excluding family members, only 10% had 2-3 employees, and 2% had more than 6. Another 14.5% employed additional workers on a contract basis. The entrepreneurs were drawn from a broad cross-section of society: 46% were skilled workers without secondary education; 34% secondary school graduates; and 14% university graduates. 32.1% reported having an entrepreneur in their family at some point in the past. 20% said that someone in their family had filed a restitution claim, but only 2.2% were using such restituted property in their business. Interestingly, 61% of the entrepreneurs were located in towns with

less than 20,000 inhabitants.

The good news was that most (70%) of the entrepreneurs were actually doing business. Of these, however, 71% were only doing it part-time, while continuing to hold a full-time job. 58% of those doing it full-time said this was a result of their being laid off from their state job. Of those who were not working as entrepreneurs at the time of the survey, 30% had started but then stopped, and 57% had yet to start. Overall, 68% considered their business satisfactory, 12% thought it successful and growing, and 20% thought it was failing. Only 10% said that, in general, conditions were good for business.

Of the 1,008 entrepreneurs who had not yet started, 23% said it was because they preferred to stay in their full-time job, while 13% complained of lack of financing and 11% lack of premises. Those who had started but then stopped attributed their decision to intense competition (23%), financial problems (13%), or because they had not yet lost their regular job (14%).

The average business income in 1991 was K426,000 ($15,300), with 7.1% reporting incomes over Kcs 1 mn. The average estimate of basic capital assets was K204,000, and stocks K246,000. Only 41% had these businesses had their own bank account, and a mere 15% hired a professional to file their tax returns.

Most entrepreneurs relied upon personal savings and loans from friends and relatives to start up their business. Only 15.2% obtained a loan from a bank - but there was little evidence of difficulties with access to bank credit, the problem which seems to have dominated much of the international aid efforts. The main obstacles the survey revealed were not so much difficulties in obtaining premises or capital, but more universal problems, such as the general lack of demand and the intensity of competition.

Respondents frequently complained about bureaucratic barriers, such as the registration and taxation requirements. In some towns tax officials on the lookout for unregistered imports would give a mere one hour's notice before arriving to check inventory. Entrepreneurs complain about the quality of tax officials, arguing

(as in many countries) that the best qualified personnel leave to become tax consultants. There is the additional problem of officials inherited from the old regime, who often are perceived as having an anti-business attitude.

The entrepreneurs showed little enthusiasm for political affairs. In reply to the question 'With which political party do you most sympathize?', among Czechs 40.1% replied 'none' and 12.8% 'don't know'. Among Slovaks, the figures were 30.0% and 7.6%. Among the Czechs, 20.4% of the entrepreneurs said they supported Vaclav Klaus' Civic Democratic Party, but none of the other parties attracted more than 4%. Among Slovaks, Vladimir Meciar's Movement for Democratic Slovakia attracted 27.2%, the Slovak National Party 9.5% and the Christian Democrats 7.1%. Overall, when asked to place themselves on the political spectrum, 12.3% said left, 51.2% center and 36.4% right. Only 9.9% said they belonged to an entrepreneurs' association. Thus there is little evidence from this survey that the 1.3 million businessmen will in any sense constitute a homogenous political bloc, or yet provide the center of political gravity which advocates of privatization see as a crucial building block of democratization.

These findings are confirmed by other survey data.[31] A World Bank team surveyed 121 Czech and Slovak private manufacturing firms in January 1992, and found that the entrepreneurs had been successful in finding a market niche, thanks largely to the expertise they had acquired in their previous careers in the state sector.[32] No less than 33% of their sales were exports, while for various reasons (including the under-valued crown) only 4% of the firms reported any serious import competition. Thanks to the small privatization and restitution programs, 50% of the firms owned their own equipment and property, compared to only 28% of firms in a comparable study in Hungary and 12% in Poland.

CONCLUSIONS

1) Private entrepreneurs have expanded rapidly in Czechoslovakia, in what was largely a spontaneous reaction to the opportunities provided by economic liberalization, and in part a reaction to the fear of redundancy. By mid 1992 there were some 300,000 full-time private entrepreneurs in Czechoslovakia, mostly engaged in single-family retailing and consumer service activities.

2) Although the upsurge of entrepreneurship is genuine, doubts can be raised as to whether the initial rate of growth will be sustained. Only a small proportion of the new entrepreneurs will grow into sizeable businesses. The small privatization and restitution programs have aided the emergence of small businesses, particularly in retailing, but further growth will require improved access to capital and managerial expertise.

3) There has been a considerable expansion of indigenous private sector consultancy and advisory services, and these seem to be reaching more entrepreneurs than the internationally sponsored programs.

4) The international community has generally been slow to respond to the needs of small business in Czechoslovakia. Three years after the revolution, most international assistance programs are still in the preparatory stages or are just beginning to come on stream. There is considerable duplication of effort by these programs, and in some cases outright competition for resources, personnel and governmental approval.

5) The influx of technical assistance demonstrated the West's political commitment to Eastern Europe - and provided some additional travel and earning opportunities for Western officials and consultants. But there is little evidence that it has played a decisive role in promoting private sector development in Czechoslovakia. The provision of services for which there is no need does not do much direct harm. But it does represent a waste of resources which could perhaps have been put to better use, and may have contributed to the regions' enduring political cynicism.

APPENDIX

Industrial performance by type of firm, Czech Republic

(Jan-June 1992 as percent of Jan-June 1991)

	total	private	cooperative	state
output	76.5	86.6	70.3	75.6

PART I: NATIVE AMERICAN TRADITIONS AND THEIR RELEVANCE

In this period of both troubling and hopeful change and, all too often, violent conflict in the United States and throughout the world, there is a growing concern for rediscovering community on all levels that will renew harmony among human beings and between humanity and the Earth. The collapse of so called Communism[1] in Eastern Europe reminds us that extremely collectivist approaches to human affairs generally fail to achieve the harmony at which they aim because these unitary approaches deny the diversity of interests and outlooks upon which any true harmony must be based. At the same time the Current U. S. experience suggests that over-reliance upon individualism as the basis of social relations may create the very war of all against all within society that Hobbes and other prudential liberals sought to escape through the social contract.[2] Locke tells us that in forming a social contract people escape the scarcity of the state of nature in order to enter society which offers the opportunity for potentially unlimited abundance.[3] Yet as we, in the late twentieth century, approach the carrying capacity of the terrestrial environment, we find that our lust for unending economic development threatens our very existence; for the laws of the state of nature requiring that we consume no more than we need,[4] now apply within society.

In the midst of the contemporary crises it seems wise to reexamine our basic concepts of politics and public policy in hopes of avoiding the dangers while grasping the opportunities to move ahead in the best way possible. While the conceivable places to which we can look for assistance in this enterprise are virtually unlimited, it is important to note there is a great deal that can be learned from societies whose members lived quite successfully in considerable harmony with each other and with nature on this continent on which we now live.[5] Indeed, there is a long history in Western political thought of learning from Native American traditions, although those traditions were generally misunderstood by those who commented upon them.[6] It is clear from reading the *Second Treatise on Government* that Locke was influenced by reports of tribal life in North America.[7] There are several places in *The Social Contract* that indicate an impact of the Native American experience upon Rousseau.[8] Much of Marx's theory of social evolution has a basis in Morgan's studies of the life of the six nations we call the Iroquois.[9] Marx and Engels found the quality of life and the level of interpersonal relations of what appeared to be earlier forms of society so fine compared with those of his own time that he came to believe that those natural human relations could return in a new form once the problem of scarcity was solved by the development of capital to a sufficiently high level. While we need not repeat the analyses of prior social thinkers, their positive reaction to North American tribal societies is an indication that surveying their experience may be helpful in finding good ways to deal with our present difficulties.

When we examine traditional (before the impact of European contact[10]) politics among Native American tribes and bands we see that politics has a somewhat different character than has been accepted by the main stream of Western political theory beginning with Hobbes and, perhaps, Machievelli. Traditional Native American politics is primarily about finding consensus within a community.[11] The primary function of traditional Native American political leaders is to facilitate the building of consensus.[12] Power is an important resource for doing this, but power is not the central element for determining "the authoratative allocation of values"[13] (or for determining "who gets what, when, where, how")[14]. Moreover, power in Native American tribal and band societies is only partly a vehicle for control. It is also a source of empowerment. Tribal and band politics have very important cooperative elements along with competitive aspects. At the heart of this politics is a set of communal relationships based upon mutual respect emphasizing both the community and the individual, so that in a very important sense the whole is equal to the part.

The consensus building nature of traditional Native American politics can be seen consistently in surveying what is known about the pre-European contact life of tribes and bands in North America.[15] For example, among the Inuit, Unalit and other Artic bands that are commonly called Eskimos, there was no formal leadership or governmental

community. So long as he was considered a good leader (wise and beneficent) people would follow his advice in community affairs (such as when and where to move the encampment or when and how to undertake a hunt). But as soon as people were no longer satisfied with him, they would no longer follow his leadership. If some one in the community acted sufficiently outrageously to be considered a danger or serious problem to the group, the community needed to reach consensus before action could be taken against the alleged offender. Often the leader, or headman, of the community would initiate the discussion (in effect a trial), but nothing would be done unless and until general agreement had been reached as to the propriety of action.[16]

The Yakimas of the Columbia River Area of the Pacific North West also lived in small groups (50-1500 people, generally averaging 100-150).[17] Residents of each village regularly met together daily in a general council to discuss and decide important matters. Leadership was exercised by elders respected for their wisdom, outstanding individuals renowned for their virtue (particularly generosity, fairness and bravery) and those who were skilled in activities of importance to the community such as fishing and hunting. Leaders advised the group as a whole, and held considerable influence, but decisions were made by consensus. Villages generally were led by a headman and a small council. They held their positions only so long as they retained the ongoing support of the community. When support was withheld they ceased to be leaders and new leaders arose according to the needs of the village. Closely connected villages formed bands and in times of stress several bands or villages might temporarily come together, but no regular structures existed for formal collaboration.

The Dinee, generally know as the Navajo, were a society governed largely at the band level with some what more complexity in their social organization owing to their strong clan structure.[18] It appears that clans (extended family units) were important in public affairs because they were responsible for the behavior of their own members (eg, debts, torts and crimes), and since clans gave considerable emotional and economic support to their members, pressure from kinsmen, especially elders, was likely to have exerted a strong influence. In speaking of more contemporary local governance, Kluckhohn and Leighton describe what was likely true of the old band government and which was typical of traditional Native American government in general.[19]

> Head men have no powers of coercion, save possibly that some people fear them as potental witces, but they have responsibilities. They are often expected, for example, to look after the interests of the needy who are without close relatives or whose relatives neglect them [a rare occurrence in traditional times], but all they can do with the neglectful ones is talk to them. No program put forward by a headman is praticable unless it wins public endorsement or has the tacit backing of a high proportion of the influential men and women of the area.

The two authors go on to say that at meetings, "the Navaho pattern was for discussion to be continued until unanimity was reached, or at least until those in opposition felt it was useless or impolitic to express disagreement."[20] They point out, however, that while public meetings provided an occasion for free voicing of sentiments and thrashing out of disagreements, the most important part of traditional Dinee political decision making took place informally in negotiations among clan and other leaders representing their respective groups of people who regularly discussed community concerns face to face.

Insight into the nature of the power of leaders and the process of decision making that generally pervaded traditional North American indigenous societies is given by Trigger in describing traditional ways of the people called the Huron living around Lakes Huron and Erie.[21] The Huron were a confederation of several tribes, numbering 30,000-40,000 people in 1634. They lived partially amongst each other in settlements of up to 2,000 people consisting of a central town and surrounding villages. Their social organization included a clan structure. In each community each clan segment had two formal chiefs, *Yarihawa* (literally, "he is a great voice"), who were chosen from among the men of the clan lineage that held the right to serve in the office. Their primary functions were to announce decisions arrived at by a process of consensus formation that involved discussion by all the adult men and women of their group, and to facilitate the discussion process. Chiefs could advise and persuade but they could not decide. No action could be taken until it had been acceded to by every person who was affected by it. In practice that meant that decision making tended to be inclusive of the concerns of everyone involved. To reach consensus on a proposal, the group would continue to modify it to take into account each person's concerns until almost everyone supported the decision and the few who did not, having been heard and seeing nothing to gain by further discussion, accepted the view of the group.

The chief's first duty was to assist his own group to come to a consensus and then to represent his people in

negotiating with the chiefs of other groups. Trigger states,

> Huron Chiefs had no constitutional authority to coerce their followers or force their will on anyone Moreover, individual Huron were sensitive about their honor and intolerant of external constraints, and friends and relatives would rally to the support of someone who believed himself insulted by a chief. Overbearing behavior by a chief might, therefore, encourage a violent reaction and lead to conflicts within or between lineages. In the long run, chiefs who behaved arrogantly or foolishly tended to alienate support and would be deposed by their own lineages. The ideal Huron Chief was a wise and brave man who understood his followers and won their support by means of his generosity, persuasiveness, and balanced judgement.[22]

The two chiefs of each clan segment at the local level were the civil chiefs and the war chiefs. The civil or peace chiefs, who were primary, were concerned with matters of everyday life from settling disputes, and arranging feasts, dances and games to negotiating foreign treaties. The separation of peace and war chiefs, with the primacy of the civil chiefs, is typical of many tribes. Among the Cheyenne for example, a chief of one of the military societies upon becoming one of the 44 peace chiefs would have to resign his chieftainships of the military society.[23] This primacy of civilian over military leadership is similar to the emphasis in the U.S. Constitution of the President, a civilian, being Commander and Chief over the military. It may well be that the older tribal practice is the origin, or at least a contributing source, to the U. S. practice.

The national government of each Huron tribe consisted of a council made up of Chiefs of the Clan Segments in each community (with one exception, the Tahontaenrat who lived in a single settlement, so that their community and national governments were the same) while the Confederacy Council appears to have been composed of the civil chiefs of the various national councils. The national and confederacy councils had no power to compel the groups whom their members represented. Their function was to develop consensus through dialog and mutual exchange among all the parties involved in the matters they considered. In order for the agreements of these councils to be effective, their decisions had to be accepted by the constituents of the chiefs, which meant that national and confederacy affairs were discussed by citizens at the local level to a far greater extent than is true in modern federal republican governments with the result that chiefs were usually far more representative than elected representatives are today.

While each of the peoples of North America had its own distinct culture and ways of government, there was a general pattern of underlying principles. In some way or other, virtually every North American culture developed its own unique way of dynamically balancing a set of seemingly opposite values to produce a harmonious unity (*E pluribus Unum*?). Beginning in terms of what we have been discussing, the first pair of opposites consists of freedom and autonomy for the individual (person and group) harmonized with the primacy of the whole group (family, clan, working group or party, village, tribe, world, etc.: what ever level of wholeness was relevant in a particular context). This was illustrated by the broad range of societies briefly referred to above and can be seen in others representing additional geographic areas and ways of economic and social living.[24] The general principles applied even in the most diverse of cultures. For example the collection of cultures in the Southwest referred to as Pueblos were strongly formal in their governance (particularly in contrast to the informality of their Dinee neighbors).[25] Perhaps more than any other traditional North American societies, the Pueblos emphasized the spiritual nature of life to the point where spirituality was not just a part of life, but life itself. Life in the Pueblos was tightly integrated with an emphasis upon unity that was perhaps the strongest of any traditional North American societies. Yet the place of individuality (of person and group) remained. In the cycle of the year's highly organized rituals each individual had a distinct role.[26] At first glance, Pueblos appear to be governed by a theocracy. But the leading priests and the governor ("cacique," following the Spanish nomenclature) chosen by the council of priests, like chiefs elsewhere, could only advise but not command. The Cacique and his assistants oversaw executive process, and, like the European formal head of state (monarch or president), he announced decisions of the pueblo council. But in legislative and judicial matters, including oversight of execution, decision making was undertaken through consensus by the council[27] along the same general lines typical of Native American traditional government as indicated above.

Along with the bringing together of the principles of individuality and wholness in traditional North American society was a harmonizing of competitiveness (among individuals and groups) and cooperation. Among the plains tribes, such as the Lakota (Western Sioux), for example, there were numerous opportunities to compete for honor in undertaking socially desirable actions and exhibiting the four virtues: bravery, fortitude, generosity and wisdom.[28] This might take place in warfare where a man would be recognized for being among the first in a battle to touch an enemy or for leading a raid to steal horses from an enemy camp. When a young Lakota man went on his first buffalo hunt or undertook some honorable action his father would often have the camp crier go round the village

announcing that he was giving away a horse to a poor family in honor of his son's deed.[29] Giving to those less fortunate was honorable and gained the benefactor prestige. A woman would be honored for making beautiful articles of clothing and sharing them with others. Conversely, hoarding of goods for oneself was dishonorable, and indeed any unvirtuous act reduced the prestige of the doer.

By channeling competitiveness into promoting helpfulness, Native American societies tended to promote collaboration. The harmonizing of competitiveness with cooperation was accomplished more directly in other ways, however. One of the most important of these was through inclusiveness, by providing everyone with a role in community affairs, as exemplified by the consensus decision making processes discussed above. An essential element in the development and maintenance of cooperation was the acculturation to collaborative values, stressing the wellbeing of the whole (family, clan, tribe, world, etc.) before everything else[30] while providing continual opportunity to participate in supporting the whole through activities involving mutual support. The fact that the harmony of the individual with the whole was reenforced by a spirituality that pervaded all of life, consistent with the social values of each people, was also an important dimension of the development of individual and social integration. For instance, if you go to a Lakota Sun Dance and ask the Dancers why they endure four gruelling days dancing beneath the hot sun without food or drink, they will not tell you that it is to gain prestige or to receive personal spiritual power, though those things may come to them. The dancers will tell you that they give themselves away that "the people may live."[31]

A very important aspect of the principle of inclusiveness is mutual empowerment of the individual person and group and of the whole group and society. By giving each person and group continual opportunity to participate in their own unique way in decision making and in the work of providing for the welfare of the larger group and community, each person and social unit was provided the freedom, sense of purpose, and opportunity for self actualization and development necessary for their own realization in ways that directly provided for the needs of the community. As we are beginning to learn now in the workplace with the rise of employee involvement and team process, this method of harmonizing individual freedom with social purpose is exceedingly efficient, effective and productive[32]. The unity through diversity involved also provides for a high level of equality while allowing for differences in prestige. Where in hierarchical social systems differences of function tend to be marked by significant differences in status, participatory systems tend to minimize status differences. For example, in differing ways in each society, men and women in Native American cultures carried out different functions and had a greater say in different areas of social life. But this division of labor did not produce the difference in status and value that accompanied the dichotomy of social roles in Western society. Among the Haudenosaunee or Six Nations, widely known as the Iroquois, for example, only men served as chiefs (*sachems*) on the intertribal council, but women held considerable power. In certain clans, the women, speaking through the Clan Mother, nominated the chiefs and had the power to remove them for misconduct.[33]

At least in some cases, the strong emphasize upon the whole community developed in indigenous North American cultures to counter the dangers of unrestrained individuality in the person, family or other group. For the Cheyenne, for example, Hoebel reports that the centralization of political authority in the 44 tribal peace chiefs, the predominance of public over private law and the very strong prohibition against killing another Cheyenne all arose to counter the threat of internal disintegration.[34] For the Lakota, the Sacred Pipe, often referred to as the "Peace Pipe," is central to all religious rituals and was smoked to sanctify and affirm the reaching of agreements (or the willingness to come to agreement), including the settlement of disputes.[35] In at least some versions of the story of the White Buffalo Calf Woman's bringing of the Pipe to the people, her arrival came at a time of great trouble and disharmony which was healed by the coming of the Pipe.[36] The history is quite clear among the Six Nations or Haudenosaunee. Their current ways, including their confederation (the Great Peace), arose to overcome internal dissension.[37] It was a time of blood feud among clan units and fighting between tribes reminiscent in our own time of the civil war in Lebanon and gang wars in Los Angeles. Thanks to the vision and work of the Peacemaker (Deganawidah) assisted by Hayanwatah (or Hiawatha) the Great Peace was achieved and an extremely participatory government based upon principles of equality and justice was installed with responsibility that each decision and action by the people be beneficial in its results to the seventh generation yet to come. That government and numerous others across traditional North America were able to guide, in a most democratic manner, societies that were remarkably peaceful, prosperous and happy for virtually all of their citizens.

In looking at our own politics in the light of Native American experiences it is important to ask if we in the West have traditionally over emphasized power, particularly as control, competition and the state as the core of our politics? I believe the answer is that we have and that this has contributed to the growth of fragmentation and

alienation experienced by citizens in Western societies.[38] For instance, In looking at the operation of federalism in the United States it is now well recognized that while in legal theory it constitutes a system based upon separation of powers, in practice, federalism operates as a cooperative system (with competitive elements) with the federal government more often carrying out policy by empowering the states and localities through grants in aid, than by exercising control.[39] In carrying out regulation within its own sphere of powers, the federal government has always been aware that there are limits to the extent to which it can be successful in achieving desired policy results entirely through exercising control. Therefore, a certain amount of cooperation through attempting to gain voluntary compliance from those regulated is a quite traditional element in American regulatory activity. The problem is that we have not fully recognized the extent to which politics in principle involves the harmonization of cooperation and conflict, requiring empowerment in a process of consensus building which is central to the process of governance.

In the process of regulation, the case of protection of the environment offers a useful example. For many years, we have regulated both at the federal and state levels primarily through a command system requiring a large bureaucracy.[40] EPA in particular, but the state agencies as well, have been very slow to develop regulations, inefficient in gaining compliance and expensive to operate in large part because the command driven bureaucracy is far more inefficient than are cooperative mission driven systems.[41] Moreover, the command system of regulation fosters competitiveness encouraging a fragmentation of interests with a premium on the power of individual interests to influence the process. This is not to say that disproportionate power is not a problem in any political process or system, rather that strongly competitive systems emphasize power differences.

Recently, more collaborative and inclusive approaches have begun to be taken in the field of environmental policy. The EPA, for instance, has developed a process for developing regulation by bringing all the interested parties (primarily representatives of environmental groups, business and the agency) together to participate in consensus decision making. Any of the parties may withdraw from the process at any time. But if they accept the final agreement, they can not challenge it in court. The process of dialog takes time, but usually results in better decisions than competitive processes because the policies made attempt to accommodate all of the concerns and interests of those affected to create a viable policy as a whole. Decisions from competitive processes tend to be the results of the ability of the contenders to force the inclusion of as much of their position as possible in the final outcome, with compromises being determined more in terms of giving specific pieces of the policy to different parties than to achieving a well working policy as a whole. The setting of new standards for the contents of gasoline in 1991 used this new inclusive process.[42] Often when the process fails to produce a consensus it is still useful, because agreement is invariably reached on many of the issues, leaving only a narrow range of questions, which have already been well framed by the discussion of the concerned parties, for decision by the agency using the standard processes. Several states including Indiana, California and Florida have taken an inclusive approach to promoting energy conservation and pollution reduction in the generation of electric power.[43] In the past, there have been no incentives for power companies to operate efficiently or to encourage customers to conserve energy.[44] Using the inclusive process, power company, environmental group and consumer group representatives have sat down together along with state officials to develop regulation that will save consumers money and reduce energy use (thereby reducing pollution) through allowing power producers to benefit financially from encouraging consumers to be energy efficient.

For such inclusive processes to function properly there are a number of requirements. First, the process must be truly inclusive, including all the interested parties on an equal basis. If only one or a few of the interested parties are involved in the process it is only a vehicle of hierarchical, special interest driven, competitive government. Vice President Dan Quale's Competitivness Council,[45] involving only big business leaders and government personnel in blocking new federal regulation, and the older practice of having the Business Advisory Council, composed of the leadership of big business, meet regularly with the top officials in the Department of commerce and various cabinet members in exclusive sessions, paid for by the Department, at the Homestead in Hotsprings, VA and other expensive resorts,[46] are examples of exclusive rather than inclusive processes that are not legitimate Second, the power of the parties in the process needs to be reasonably equal to the extent of their interest in order that the outcome be equitable. Third, there need to be reasons, or incentives, for those interested to participate and the consciousness of the parties must be such that they are open to participating.

The need for inclusive approaches is not limited to environmental policy or to regulation in general. Currently, government in the United States and much of the world faces a series of related crises in internal operations and external relations. Some of these difficulties relate to the way in which we conceptualize and operate governmental processes. By failing to recognize the extent to which governance is in principle a collaborative and empowering enterprize we have greatly increased the costs of its operation, limited its effectiveness and distanced it from the

people.[47] The second level of the problem has to do with relations among people. A shrinking and rapidly changing world has increased the level of cross cultural interaction externally while magnifying the diversity of populations internally. Just as the Haudenosaunee and other Native American societies developed inclusive processes that achieved unity through honoring diversity in order to overcome the dangers of divisiveness, so we too need to develop inclusive relations that create community through empowering individuality in socially useful ways.

The principle of diversity, itself, tells us that we can not simply copy from others in order to develop a politics of harmony. Each people and generation is unique, and needs to develop creatively in its own terms. But if we are to achieve community we must remember that in our uniqueness we are not so much independent, as interdependent. While our age and situation are our own, they are sufficiently similar to others that there is much that we can learn from others who struggled with the same problems. Indeed, the very differences are virtues when we understand them, for they give us a useful perspective that we would otherwise be denied. Given our current condition, there is a great deal that we can learn by looking further into the depths of the traditions of some of those who have preceded us on this continent and are still very much with us.

PART II: LEARNING FROM NATIVE AMERICAN TRADITIONS

In order to attain productive and harmonious relations within and between communities it is essential that human interaction come to be based upon mutual respect[48] unless people deal with each other as equal partners in a mutual relationship, interaction is likely to lead to injustice and dangerous dominance. This in turn will most probably lead to an ongoing struggle marked by open and/or structural violence. To break out of the recurring cycles of repression and violence it is necessary that we build human relationships upon the principle of "unity in diversity," so that each of us respects the interests, views and ways of all individuals, groups and cultures. This is important not only to avoid doing harm to others, but because we each have something to learn from every person, group and culture. It is mutually advantageous for all of us to move from relations founded upon cultural hegemony to relations centered upon cultural sharing and exchange.

The principle that relationships need to be based upon mutual respect was central to traditional Native American cultures. Virtually all of the traditional peoples of North America see human beings as part of the natural harmony of the whole of nature. For example, in all important ceremonies the Lakota people respectfully acknowledge *mitakye oyas'in*[49] "all my relations." Thus they signify their respect for all they are integrally connected to, not only their immediate family, but all of the two leggeds, the four leggeds, the creepy crawlies, the bird nations, the grass nations, the rock nations, all that share in this world. There is respect for the environment; one never takes more than one needs. One is careful never to deplete the resources of any place, always leaving enough of a plant or animal to allow for natural renewal in the next cycle of seasons. And even then, one only picks a plant or kills an animal respectfully, after asking its permission and forgiveness.

The principle of harmony with nature and with other people was expressed by the Dine (Navajo) in their regular statement of parting, "May you walk in Beauty."[50] It is important to live in balance with all one's relations. Many of the tribal renewal rituals of plains and Rocky Mountain peoples emphasize maintaining and renewing harmony. The Sun Dance of the Southern Utes, for example, is undertaken to "court Grandmother Earth that She will be bountiful to us again next year," and to renew harmony in relations within the community and the world.[51] When one is out of harmony, action must be taken to restore appropriate balance and order. The Dine have many rituals for returning a suffering person to the path of beauty. If two Lakota boys are continually in conflict, the lesson of social harmony is often taught them by tying them together by their braids until they learn how to get along.

These traditional values of harmony with nature and among people have a special importance for us today in developing environmental consciousness and the positive cross-cultural and transnational relationships that the world needs for survival and a high quallty of life for all people. But the concern for maintaining and reestablishing harmony has additional contemporary value. For example, among the Cheyenne the principle of restoring harmony in relations makes rehabilitation important in instances of deviant behavior.[52]

Hoebel[53] describes a case in which two young men were caught hunting buffalo on their own. Solo hunting was prohibited because one or a few hunters might scare a herd away. To insure an adequate food supply buffalo hunting had to be undertaken by the whole tribe in a coordinated action. When members of the military society policing the hunt came upon the offenders, the military society members shot the horses of the illicit hunters and broke their weapons in the course of inflicting a beating *that the two men did not resist.* After the two miscreants had listened

silently to a reproach for their dangerous behavior, one of the chiefs of the military society called out, "Look how these two boys are here in our midst. Now they have no horses and no weapons. What do you men want to do about it?" One of the police patrol spoke up, "Well, I have some extra horses. I will give one of them to them." Another member of the military society did the same. Then a third member of the patrol declared, "We broke those guns they had. I have two guns. I will give them one." All the others responded, "Ipewa, Good." In this case the police enforced the law quickly and firmly. But once it was clear that the violators had learned their lesson they were reintegrated with the group through the generous acts of those who had inflicted the punishment.

The value of restoring harmony in terms of learning, exemplified by the Cheyenne case, has relevance to the contemporary world. This is the case not only in terms of correcting deviant behavior, but in keeping up with the rapidly changing world and in helping people to develop their positive potentials more fully in those areas of life that are relatively stable as well as in relation to changing circumstances. To the extent that each of us can see life, in the familly, the workplace, in society and in the world, as an ongoing learning experience we will be open to participating affirmatively in the changes that we need to make in adopting to new circumstances and in improving what we are doing in ongoing situations.[54] Evidence for this is provided by the success of many of the leading companies taking part in the current worldwide revolution in managenent and work relations.[55] Development by everyone in the workplace of the view that life is experimental, providing a continual set of opportunities for learning and improvement, has been a very important element in their success. These firms, along with numerous public sector and nonprofit organizations have been significantly improving productivity and the quality of working life through instituting participatory team process. On the most successful of these teams everyone is continually learning from everyone else and from the ongoing work experience. The result of this mutual empowerment is continual improvement of operations, relations and personal satisfaction in terms of virtually every standard that one might suggest.[56] But while the view of life as education is important in the success of these participatory working groups, it is but one of the essential elements in their culture. Perhaps even more important to the successful team is a balancing of the values of unity and diversity in ways that are quite anlagous to traditional North American ways of seeing.

In the native cultures we are considering, there is an emphasis upon the whole: the whole family, clan, tribe and the world. Being is understood as relational[57] so that one's meaning comes from participating in the whole at many levels. Most ceremonies are undertaken with all the participants sitting in a circle which represents wholeness. But within the bond of unity there is a respect for diversity based upon the uniqueness and individuality of each person, group and people. Together we form the medicine wheel,[58] the circle of life. Our purpose is in filling our place in the circle. but there is no circle without all of the individual places in it, each of which has a different quality as seen in each of the four directions. Each direction provides a different way of seeing the whole. Therefore, no decision can be made without consulting everyone to hear how the situation looks from their place in the circle.

In a council circle or Pipe ceremony of the plains tribes, a talking stick circulates so that each person in turn has the opportunity to speak, and to pray when the Pipe comes to them as it goes round. Whoever holds the talking stick or the Pipe is the center of the circle. Since everyone has their turn (with the talking stick and Pipe), each person has their opportunity to be heard and to be the focus of everyone's attention. Everyone is born into a given place in the circle. If one lives well they will explore the circle and come to know the other places.

The places in the circle are conceptualized in terms of the four cardinal directions: East, South, West and North (actually six including Sky above and Earth below, but we will only discuss the four here). Because different people experience each of the directions differently (in part because they see them from different places in the circle) it is impossible to define the qualities of each direction conclusively. What is said here about each of the directions is intended to give an introductory understanding which readers can use as a starting point if they wish to work further with the Medicine Wheel. One can work with the four directions both as a method for understanding differences among people and as a vehicle for one's own inner development, since each of us is endowed with qualities relating to each of the places in the circle. For example, a person concentrating upon the qualities of a particular direction may find it a helpful metaphor to sit in that place in the wheel during a gathering or by thmselves in contemplation.

The East is the place in which the sun rises. It's quality is illumination, the gaining of knowledge. For Lakota and Cheyenne people the eagle is often seen as being in the East. Flying higher than any other bird, the eagle brings the devine messages of Grandfather (ie. God) into the world. The East is also the place of the dawn, of birth and new beginnings: the opening place of new cycles of growth and learning.

The South is the place of childhood, its qualities are innocence and trust. Some see the jumping mouse as one of the

animals in the South. For some, the South is the direction of human relationship and of working in the world.

The West is where the sun goes down. It is the gateway to dreams, to looking inside onself for self-understanding. The bear is often identified with the west. For many the west is a powerful direction, the place of the thunder beings and the direction from which the weather, including thunder storms, comes. In many ceremonies the medicine man who is leading will sit in the West (though often not in Lakota Ceremonies where the leader faces West), but this is both because of that direction's qualities and because one sitting in the West of the circle faces East. The West is the place of adulthood or maturity.

The North is the place of Wisdom, of old age and learning from experience before returning East to begin a new cycle of growth and learning. For people's of the plains the Buffalo is often in the North, for the buffalo is so important to plains life that it represents the whole. (Many Northeast people place the turtle in the North, for North America is seen as Turtle Island; we live upon the back of the Turtle). From the North one has the distant perspective to understand the whole of life and of particular issues.

There are some interesting parallels between traditional views of the four directions and Carl Jung's quarternio of modes of perceiving and mental processing.[59] These are thought, feeling, intuition and sensation. According to Jung and Meyers-Briggs personality typing,[60] different people utilize these four functions to different degrees in their mental processing with one function tending to be dominant. Although there are differences in the two systems, working with both the Four Directions and Jung's quarternio (Meyers-Briggs) it is clear that different people perceive and process information differently, which we need to understand whether in educating, decision making, designing and assigning jobs, putting together working groups, or in relating to one another.

It is interesting to consider the correspondences between the Four Directions and Jung's quarternio. It needs to be noted, however, that different people see the interrelations differently so that if one wishes to work with the two systems one needs to become familiar enough with each of them to reach one's own informed conclusion. For example, some people see the East as the place of intuition, since it is the direction of illumination and the dawning of knowledge. To me, East is the "ah ha!" direction in terms of thinking, and intuition is in the North. For the eagle in the East is an active hunter, the inner-warrior, while the wisdom of the North is the cold, detached wisdom like that of the monk in the high Himalayas, who by sitting passively develops an opening for knowledge to enter through intuition. Similarly, some find intellect in the west, seeing analysis as the way of self-discovery. For me feeling is most connected with the west, for I survey my inner-self by awareness of how I feel about things.

There is perhaps more, though less than unanimous, agreement that sensing is connected with the South. These differences in perceiving each of the directions follow from the principle of the Four Directions themselves. How we see each direction depends upon from where we see it, and with which qualities we perceive it. The East looks different depending on whether one sees it from the North or from the West.

In the Native American ways of seeing, life is relational. Each individual, and each social group, has a responsibility to every other person and social entity, indeed to all beings, seen and unseen, since even the rocks are perceived as living and pervaded by spirit.[61] Each can be helpful to each if they will be friends. In this relational view, each has a responsibility to all, including oneself; but precisely because each individual is to be respected as an independent entity in an interdependent relationship, ultimate responsibility is to oneself and it is up to each one to make their own decisions based upon their own understanding. This is somewhat similar to the Quaker emphasis upon morality through personal conscience and inner strength. People are urged to have and act upon moral values, but the emphasis is upon each person developing their own answers from deep inner reflection. This leads to the development of strong character with tolerence based upon mutual respect. This kind of moral development produces individuated people who are strong and flexible partners in dialog as each comes from their own inner strength in giving support to others in a dialectic of mutual assistance.[62]

This is precisely the kind of dialectic of mutual respect that we need to develop in the world today if a culture of peace and positive human interaction is to arise. To be realized, mutual respect needs to be more than a good idea. Friendship, relational consciousness, begins in the heart rather than in the mind. How we feel toward one another is crucial. When we feel good about others we are generous with them. In traditional Native American cultures giving of oneself is highly valued, leading to an emphasis upon sharing as opposed to trading, which follows from a focus upon acquiring. At the end of major ceremonies there is usually a give away in which at least a centeral person in the event gives to all, though some times all give to each other. For example at the end of the annual Sun Dance, the Southern Utes place a blanket in the Sun Dance lodge upon which everyone in the community, and anyone else who wishes to do

so, is invited to place a gift for the give away. When the dancing concludes, the women coordinating the give away choose a gift from the blanket for each visitor present. Since the Southern Ute Sun Dance is one of a cycle of annual Ute and Sheshone Sun Dances there is receprocity as those who give away at their home dance receive when they travel to the other dances.[63] The give away is followed by a feast. Indeed, the feast, sharing at least water and food, is an integral part of virtually all Plains and Rocky Mountain ceremonies just as communion is a major part of a Catholic Mass (though there are important differences as well as similarities between sharing in the feast or give away and communion)[64]. The sharing from the heart in the feast and give away produces a reciprocity with a high degree of compassion in contrast to the reciprocity of the market based upon calculated fairness.

As recent trends in the world accentuate, markets and the market consciousness necessary to make them function effectively have an important practical value. But if markets are to attain their ends of enhancing the quality of human life as a whole, markets and market consciousness need to be balanced by concerns for harmony, including both ecological consciousness and compassion for all people and beings. John Locke in the Seventeenth Century wrote of society arising out of, and being separate from, the state of nature.[65] At the close of the twentieth century we are rediscovering that society exists within nature and that we must synthesize our understanding of the states of society and of nature. Synthesis is the problem of the day. We cannot survive and prosper unless there is a place in our circle for all. Every person, every culture, has a place. But how is that place to be defined? And how are institutions best structured and resources allocated? Each person has their own view which has some legitimate basis in reality. No one, alone, can produce viable solutions. The problem now is to develop processes for dialog based upon mutual respect. Traditional Native American societies can give us some examples of how this can be done as indicated above in discussing their use of consensus decission making. In addition some of the better, current workplace teams provide some hopeful models.[66]

To develop, and operate successfully, processes for human interaction require an appropriate culture. In learning to create and operate new forms of interrelating so that we can get to peace in ourselves, our families, our friendships, our workplaces, our communities and in the world, we do not need to reinvent the wheel. In evolving a harmonious culture we would do well to learn from and build upon the traditions of those who have preceded us in living as participants in the whole. I suggest here that there is a great deal that is helpful that we can learn from traditional Native American culture and which can be used in educating for better ways of living and relating. In proposing this I do not suggest that we try to become Native Americans. Our problem is to become ourselves more fully. But in doing this we can learn from each other.

We need to be careful not to romanticize Native American, or any other, cultures. None are perfect. Moreover, of that which is clearly positive in a culture, only a part is transferable or usefully suggestive to other settings. In the case of the traditional plains and south west Societies, for example, some aspects of their emphasis upon honor and shame are not appropriate for us now, at least not those of us in the West who are seeking better ways of relating. For while concern for honor and shame promoted the development of character and virtue that we very much need more of today, they also tended to lead to struggle for position and the appearence of virtue, rather than virtue itself. This tends to promote devisive competition and infighting that run counter to those values relating to harmony through unity in diversity that are most relevant now. It is precisely in relation to those values that we can take an important step toward enhancing the rise of a culture based upon mutual respect, by learning from those to whom the mainstream has given too little respect in the past. It is time for us to realize, that in the unity of our many faceted relationships, we are a circle of circles.

FOOTNOTES

1. Whether or not the "Communist" governments of East Europe were, in fact, communist or socialist in Marx's sense is a question that has been subject to considerable debate. It should be noted that in speaking of extremely collectivist governments I refer only to those that are colectivist at the expensive of individualism and do not include those, such as the Kibbutzim or the Paris Commune that mixed collectivism and individualism through participatory democracy (as did many traditional Native American Governments discussed below).

2. Benjamin Barber, *Strong Democracy: Participatory Politics for a New Age* (Berekeley, CA: University of California Press, 1984) Part I.

3. John Locke, *The Second Treatise on Civil Government*, (Buffalo, NY: Prometheus Books, 1986) Ch. V.

4. *Ibid.*

5. The generally high quality of life among traditional Native American peoples with virtually no poverty or crime, mechanisms to provide for those who were not well off, a great deal of emotional and physical support for people from extended family members, and a sufficient variety of choices of social roles so that almost everyone could find acceptance and develop self-esteem is attested to in numerous ethnographies and commentaries. E. Adamson Hoebel gives a good brief picture of many of the virtues (and problems) of Eskimo, Comanche, Kiowa and Cheyenne life in, *The Law of Primitive Man* (New York: Atheneum, 1976) Ch. 5 & 7. From the very first contact, Europeans were impressed with the character of Native American people and their ways of living. Sharon O'Brien, in *American Indian Tribal Government*, provides two notable quotations. First. O'Brien quotes observations from Christopher Columbus diary concerning the Native people he encountered, "They are loving people, without covetness....They love their neighbors as themselves, and their speech is the sweetest and gentlest in the world" (p. 37). Second, she quotes from Hector St. John Crevecoeur, *Letters of an American Farmer* (1782), "There must be in their [the Indians'] social bond something singularly captivating, and far superior to anything to be boasted among us; for thousands of Europeans are [have become] Indians, and we have no example of even one of those Aborigines having from choice become Europeans" (p.40).

6. John Mohawk, "Indians and Democracy: No One Ever Told Us," in Oren Lyons, John Mohawk, Vine Deloria, Jr., Laurence Hauptman, Howard Berman, Donald Grinde, Jr., Curtis Berkey and Robert Venables, *Exiled in the Land of the Free: Democracy, Indian Nations, and the U. S. Constitution* (Santa Fe, NM: Clear Light Publishers, 1992).

7. *The Second Treatise on Civil Government*, #108 (p. 61) & #184 (p. 102).

8. Jean Jacques Rousseau, *The Social Contract* (New York: E. P. Dutton and Co., Inc., 1950), Book III, Ch. V (p. 67), and indirectly on the subject of confederacy as a new subject in reference to the Six Nations or Iroquois league and other native American confederations including the Huron, Book III, Ch. XV (pp. 96-97 in the footnote). Rouseau also commented favorably on Native American live in, "A Discourse on the Origin of Inequality" published in the same volume.

9. T. B. Bottomore, *Karl Marx: Selected Writings in Sociology & Social Philosophy* (New York: McGraw-Hill Book Company, 1964) Introduction at p. 39. Marx and Engles had read L. H. Morgan, *Ancient Society*.

10. While it is impossible to have direct knowledge of Native American ways before contact with Europeans, a great deal of information is available about various North American societies at the time of contact and shortly enough thereafter so that their ways were not yet changed by the arrival of Europeans. Since the spread of Europeans in large numbers across the continent was not sufficient to disrupt the traditional ways of some tribes until well into the 19th century, there was a long period during which information on traditional ways was collected by Europeans and their descendents. In addition interviewing has been done of older people who themselves remembered traditional ways and much has been preserved in tribal and band oral history (or was preserved long enough to set down in writing) so that it is possible, in many cases, to distinguish traditional from later ways. There are, of course, many holes in contemporary knowledge of traditional ways, and many points about which there is uncertainty. In some cases, aspects of traditional ways relating to governance continue to this day as pointed out by O'Brien in *American Indian Tribal Governments,* p. 17 with reference to Ch. 1 and Part 3 of that work. In considering Native American Ways it is important to note the bredth of variety and the individuality of the many cultures. Some idea of this is given in Harold Driver, *Indians of North America* (Chicago: University of Chicago Press, 1969) and in Joseph Eppes Brown, *The Spiritual Legacy of the American Indian* (New York: The Crossroads Publishing Co., 1988).

47. Osborne and Gaebler, *Reinventing Government.*

48. For a discussion of this necessity and of the process of building a culture of peace based upon mutual respect and unity in diversity see Stephen M. Sachs, "Building the World Team: Getting to Peace Through Developing a Collaborative Culture," *Organization Development Journal*, Vol. 8, No. 1, Spring 1990, and "Learning the Pedegogy of Peace: or Living the World Team into Existence," paper presented at the COPRED 16th annual Conference in Milwaukee, 1987 (available from the author).

49. Most of the points concerning spiritual aspects of Lakota, or Western Sioux, culture discussed in this paper are considered at greater length in Stolzman, *The Pipe and Christ*. Additional information on the Lakota can be found in John G. Neihardt, Black Elk Speaks (New York: Pocket Books, 1959), Joseph Epes Brown, *The Sacred Pipe: Black Elk's Account of the Seven Rites of the Oglala Sioux* (Norman: University of Oklahoma Press, 1953) , John (Fire) Lame Deer and Richard Erdoes, *Lame Deer: Seeker of Visions* (New york: Washington Square Press, 1972), Wallace Black Elk and William S. Lyon, *Black Elk: The Sacred ways of a Lakota* (New York: Harper and Row,1990, Charles A Eastman (Ohiyesa), *The Soul of the Indian: An Interpretation*, (Lincoln, NE: University of Nebraska Press, 1980 reprinting the 1911 edition), and Royal Hassrick, *The Sioux*. Much understanding of the traditional Lakota can also be gleaned from Mari Sandoz biographical novel, *Crazy Horse: The Strange Man of the Oglalas* (Lincoln, NE: University of Nebraska Press, 1942).

50. For more information on the Dine, or Navajo, see Kluckhohn and Leighton, *The Navaho*, James F. Downes, *The Navjo* (New York: Holt Reinhart and Winston, Inc., 1972) with chapters 2, 3 and 8 particularly relevant to this paper, and Alice Reichard, *Navaho Religion* (New York: Pantheon Books, Bollingen Series, 1950). A very enjoyable way to become familiar with Dine culture is through the mystery novels of Tony Hillerman including, *Listening woman, The Blessing Way, Skin Walkers, The Ghost Way The Dark winds, Dance Hall of the Dead, People of Darkness* and *A Thief of Time* many of which are Avon Books paper backs.

51. Discussion of the Southern Utes in this paper is based upon the Author's support from 1986-1992 of the annual Southern Ute Sun Dance held on the tribal Sun Dance Ground near Ignacio, Co. He participated in the drumming for the Sun Dance in 1989 through 1991. Some information on the Utes is available in Charles S. Marsh, *The Utes of Colorado: People of the Shining Mountains* (Boulder, CO: Pruett Publishing Co., 1982, Jan Pettit, *Utes: The Mountain*

People (Colorado Springs: Century One Press, 1982) and James Jefferson, Robert Delaney, Gregory Thompson and Floyd O'Neill, *The Southern Utes: A Tribal History* (Ignacio, CO: Southern Ute Tribe, 1972) which contains a useful bibliographical essay. An excellent study of the Ute and Shoshone cycle of Sun Dances in historical, social, economic and political perspective until 1969 is Joseph G. Jorgensen, *The Sun Dance Religion: Power to the Powerless* (Chicago: University of Chicago Press, 1972).

52. An excellent short ethnography of the Cheyennes with additional bibliography is E. Adamson Hoebel, *The Cheyenne: Indians of the Great Plains*. A longer ethnographic work focussing on traditional law, and hence saying much about governance and something of other aspects of Cheyenne life, is Karl Llewellyn and E. Adamson Hoebel, *The Cheyenne Way* (Norman: University of Oklahoma Press, 1941). A very fine picture of traditional plains culture in general, and Cheyenne ways in particular, is Heyemeyohsts Storm's novel, *Seven Arrows* (New cork: Ballantine Books, 1972). The work was written as a teaching and the first three chapters are explanation of core cultural principles.

53. Hoebel, *The Law of Primitive Man:*, Ch. 7, "Comanche, Kiowa and Cheyenne: Plains Indian Law in Development," pp. 150-153.

54. Sachs, "Building the World Team," pp. 20-21.

Washington University Political Science Paper No. 211

MUST ALL POLITICS BE LOCAL: SPATIAL ATTACHMENTS AND THE POLITICS OF PLACE

by
Robert H. Salisbury

When Tip O'Neill's father(O'Neill, 1987) instructed him in that basic truth that "All politics is local," he was referring to the fact that in the United States nearly all elections are won or lost entirely within the boundaries of particular local constituencies, and that by pleasing locally circumscribed interests politicians prosper. When Bill Clinton intoned, "I still believe in a place called Hope," he reminded us that we all come from somewhere and that many of us not only carry the imprint of our geographical origins but retain affective ties to them. And as military bases are closed and farm subsidies cut. we see once again how much public policy consists of components with differentiated impact on particular localities. In this sense too, much if not all of our politics is local.

Yet in one of the more sizable ironies of social science we have undertaken very little research into the ways Americans think about or identify with the places that so substantially define their lives. We know, of course, that many of us put a high value on our home town. Our breasts swell with patriotic pride when a native son is feted for some achievement or when the local team wins the championship. Well over a century after the end of the War Between the States we still, many of us, are emotionally attached to city, state or region. But while in general we know this to be true, we have no idea of the magnitude or specific content of these attachments to place, nor do we have more than a glimmering as to what difference, if any, such attachments and loyalties may make in our politically relevant attitudes and actions. For forty years we have studied identification with political parties with great care and imagination, but we have ignored almost totally identification with place. And this in a nation defined more than almost any other by its geographical configurations--its cities and states, its neighborhoods and districts.

Inasmuch as we have so little systematic data regarding the spatial dimension of American political identities, it is difficult to construct a sensible paper that builds directly on the topic. Instead, therefore,I propose to proceed along a more indirect path. First, I speculate as to why social scientists have so blithely skipped over geographically specific attachments in favor of other organizing concepts. Next, I undertake a shamelessly "Broad Brush" sketch of the American historical experience with am eye to identifying some of the reasons that led Americans to become and remain so insistently local in so many of their essential orientations. Third, I explore the more specifically political aspects of spatial identification, mindful of Tip O'Neill's aphorism but considering also the extent to which political localism itself has contributed, in turn, to the persistence of more general local attachments and self-definitions. I will contend that whatever affective mechanisms may be at work the structure of the American political system gives great weight to the concerns of differentiated local areas. Along the way I will try to connect the discussion of political localism to concepts of pluralism, both empirical and normative. My argument here is that a proper understanding of American pluralism must be firmly and explicitly situated in a recognition of the

localist structure of the political order in which one important factor is the power, past and present, of citizen attachments to particular places. and so we must begin to map the territory.

xxxxxxxxxxxxx

Political science is not unique among scholarly disciplines in its scanting of space and place. At least since the nostalgia-laden regionalists of the 1930s, humanists and social scientists have generally given short shrift to geographical factors, regarding them as of declining force at most in shaping the major categories of American attitudes and behavior. Since World War II geography as a separate discipline has not enjoyed the prosperity of other academic fields. There are occasional flurries of interest, especially within the rather catch-all "field" of American studies (cf., eg, Franklin and Steiner, 1992; Schlereth, 1990; and especially, Tuan, 1977), and a somewhat larger volume of popular attention to cultural geography(Zelinsky, 1973, inter alia), but systematic scholarly investigation into the meaning and impact of place and space scarcely exists. Indeed, there is much less attention to the ways in which spatial configurations shape the American political world, where they matter profoundly(though see, Meinig, 1986), than in Great Britain where they matter much less but the discipline of political geography is very lively.Why the neglect? I offer six related but distinct pieces of an explanation.

Urbanization. For three centuries or more a powerful social dynamic in the Western world has been the growth of cities. Larger and larger conurbations have enveloped the land, and it has generally been supposed that the increase in scale was accompanied by a commensurate loss of intimate community, especially as various functional areas of life - residence, work, worship, recreation, etc.- came to be differentiated from one another, both socially - involving separate patterns of interaction with functionally specialized others - and spatially (Katznelson, 1981). This was in sharp contrast to the rural village, yeoman smallholding, or mercantile market center where life was more or less integrated, contained within a single set of boundaries;,i.e.,a place. Obviously, this differentiation was a prolonged process spread over many decades with important countertrends and surviving remnants, but the long run direction seemed clear enough to persuade scholars, following Tonnies, Weber, and other giants of the founding era of modern social science, to emphasize what Maurice Stein(1960) called the "Eclipse of Community."

Industrialization. Closely related to urbanization but distinct in both theory and description, the processes of industrialization were the foundations of such powerful theoretical growth as to leave little imaginative energy for such apparently frivolous pastimes as analyzing the impact of geography. Industrialization spawned Marxism and related perspectives which drew upon the inescapable observation of increasing economic inequality and the emergence of differentiated socio-economic classes to postulate class conflict as the essential dynamic of society. Classes were not much restricted to specific places, and the class struggle was expected to dominate prior attachments, whether to place, ethnic background, religious group, or any other.

Industrialization, or more properly the rise of industrial capitalism, also gave rise to other modes of economic analysis. In these theories too, however, the role of place was of minor significance. The factors of greatest importance -labor and capital - were more abstract and not closely tied, in principle at least, to any particular piece of geography. Land, of course, and many natural resources had fixed locations, but they took their economic meanings not from the social configuration of a place but from their productive interaction with more mobile factors of production. From the economist's point of view the fate of any given territory would always be problematic and subject to change according to the tides of impersonal market fortunes. Hence, there was little point in studying places as such except to see how the fixed resources of land and mineral wealth and locational advantages in transportation might lead to growth or provoke decay.

Modernity. The idea of modern is used in many different ways and modes of discourse. For present purposes I invoke it to refer to the shift away from other experiential, often localistic criteria of judgment and valuation that, broadly speaking, characterized romanticism in the arts (and, in a rather different but parallel way, pragmatism in the professions) toward the embrace of universal abstract principles accepted as valid across time and space and tolerating no "local" deviance or ad hoc adaptation to the peculiarities of terrain. Thus while Picasso displaces Corot, Eliot routs Whittier, and Stravinsky sends Dvorak packing, the Flexner Report forces medical doctors into the modern mold of germ theory medical practice and other professions likewise and quickly adopt abstract criteria of assessment that permit much stricter entrance examination and licensing in the name of quality control. Modernity in this sense is the enemy of local particularity(Parsons, 1952; Giddens,1991). Efficient Taylorism and the city manager drive out the "colorful" characters of work bench and ward headquarters. The "principles" of POSDCORB administration are taken to be equally valid in Syracuse, Santa Fe and Spokane. In the MODERN world there is little reason to dwell on the surviving differences among places except perhaps as exercises in antiquarian nostalgia or some other harmless romance.

Secularization. In the kitbag of scholars the factors discussed so far have been accompanied by a further extension of those ideas which I will label secularization(Cf.D.Martin, 1978). I must hasten to add that while I intend this concept to include its usual core meaning - the decline of religious commitment and the substitution of values and criteria of assessment drawn from non-religious sources - I wish also to include the rise of consumerism and expressive self-consciousness as explicit components of secularization in the United States.

At one level secularization may mean little more than the demythologizing of life, the stripping away of some of the ritual mystery that characterized so much of "pre-modern" society. At a more mundane level it may signify that people have stopped going to church or professing even nominal belief in the religious tenets previously dominant in the society. In the social sciences of the past century it was widely expected that the forces of modernization would undermine the authority of traditional religion and lead to an increasingly secular society(See Vidich and Lyman, 1985). Such a society would be shaped by the imperatives of class and the

principles of professional expertise and also by the demand for commodity satisfaction brought on by advertising and the consumer-driven economic growth machine. In the absence of reverence for religious authority there would be a lemming-like tendency to follow the fads of the day and to seek out modes of self-expression and identity creation by means of consumption. In the absence of norms from "above" individualism could go to whatever lengths imagination could conceive and credit cards finance. The process of secularization has the additional effect of removing from the central zone of life's activity the institutional agents of religious authority. Churches are situated in places, and if one no longer pays attention to them another anchor to a specific locality has been lost. Thus, insofar as secularization is a powerful social fact, there is less and less reason to study the attachments people have to the places they inhabit.

For more than a decade now, of course, we have recognized that the secularization hypothesis does not hold for the United States(Wald, 1991; Wuthnow, 1988, inter alia). However valid it may be for other parts of the world, its predictions have been confounded by the steady and high aggregate rate of religious belief and practice in this country. There is much flux at more detailed levels of analysis, but the overall pattern has been one of great vitality in religious commitment and substantial significance of that commitment for a variety of interesting beliefs and behaviors(Roof, 1979). After decades of neglect social scientists have redirected their energies to take a greater interest in religion in American politics, but, despite the parallels in intellectual position, that interest has not as yet spilled over to encourage analytic attention to places and spaces. Indeed, much of the recent attention to religion implies that because of the importance of televangelism and of such ubiquitous issues as abortion, geographical variance, even when it exists, must be of minor importance.

Migration. One reason for inattention to spatial attachments as a foundation of social identity is the recognition that Americans are and always have been a highly mobile people. Each year close to twenty percent change their place of residence, and something like that rate seems to have been in force for many decades(Greenwood, 1981; Caplow, 1991). In the mid-nineteenth century a given community was likely to experience a fifty percent turnover in ten years, and there is no reason to think that the pace of change has diminished since. Much population movement covers only short distances, of course, but annually some three percent - well over 7 million people per year in the 1990s! - move from one state to another.

Social scientists have devoted considerably more analytic effort to social mobility, which is supposed to be a hallmark of American culture, than to geographic migration which, the Turner Thesis notwithstanding, was presumed mostly to rearrange the map. Key(1949, 1956) and Elazar(1966, 1970), among political scientists, and Bailyn(1986) and Fischer(1989) among historians have emphasized the deep and lasting impact of initial settlement, arguing that the spatial distribution of modern behavior is profoundly affected by the value orientations of those who came first and,in a sense,planted their commitments in the soil of the locality. And yet, for such an explanation of present behavior to hold requires us to know far more than we do about the patterns of spatial movement across the generations. And, perhaps because we do not have a ready command of those

data, we have welcomed the assumption that geographical mobility will result in the progressive attenuation of place loyalty and its displacement by social class or other kinds of group attachment. Further, the increases over time in size and social complexity of the population may be expected to render any particular space more and more heterogeneous and therefore less likely to exert a common attraction upon those who happen, at any one time, to be located there.

Technology. As a sort of catchall category technology provides several elements of explanation for the disregard of place attachment. One is the advent of national, and now international, communication networks including news media, mass entertainment forms and marketing structures as well as the more intimate connections of telephone, E-mail, and jet travel. As we seem to encounter one another nearly everywhere on the planet with equal ease, the shopping malls and fast food outlets grow more and more alike throughout the country and the ten O'clock news looks and sounds the same no matter where you are.

Doubtless there are other reasons that could be adduced to account for the neglect of local attachments in the eternal quest for explanation of American political processes. There certainly seem to be more than enough already, however, to confirm the wisdom of giving such matters the back of our analytic hand. Yet I would argue that this massive array of arguments misses an essential point. Even though the cultural differences between or among geographically defined spaces may have eroded or even disappeared entirely, it does not mean that the political interests of those places have come to be the same. American workers in Seattle and Long Beach, or Fort Worth and St. Louis, may have a common social status, similar cultural orientations, and share an interest in defense production jobs, but their most insistent political concern is nevertheless an issue of conflict; it is which aerospace firm will get a given contract and thus which of them will have jobs. Even if the United States is culturally a part of the global village, our politics are still much shaped by local considerations. Let me turn then to consider some of the reasons that help explain the historical emergence and continuing persistence of political localism.

The Localist Core of the American Experience

We should begin this broad brush sweep with the prior recognition that the United States is and has always been characterized by great diversity in the spatial distribution of climate and of economically valuable resources. Far more than could ever be true of tiny England or Holland, natural resource-poor Spain or Italy, or even better-endowed but less various France and Germany, the U.S.has combined great size with natural wealth. Moreover, that wealth was, to a substantial extent, differentiated into separate and distinct geographical spaces. In modern times transportation technology and product substitutability have bridged some gaps and blurred some boundaries, but the historic differences between and among the political economies of New England, the Old South, the corn belt, the mining west, and so on continue to find significant cultural expression in our time. Only a few hardy citizens move to retirement centers in the Dakotas, recent immigrants from Asia rarely take up farming in Appalachia, and Erskine Caldwell's best efforts failed to produce much gold from the mines of Georgia. So we must start with the recognition of resource and

climate constraints that give part of the shape and substance to any particular chunk of the nation's real estate.

A Nation of Islands. America was not settled all at once. That may seem both obvious and trivial, but it leads to an important point. If we were to be legalistically inclined, we might examine colonial charters, treaties and other formal means of territorial expansion, and other such indicators of state formation. Such a focus yields a highly aggregated view, abstracted from the behavioral realities of community building and, because it implies that the relatively large legal entities were also the effective units of political and social life, it is seriously misleading. In particular, the governmental units we call states and their major subdivisions generally contained a considerable variety of people with somewhat diverse interests; in short, they were pluralistic in composition. But at the community level it is more appropriate to use Robert Wiebe's phrase(1975) and refer to "island communities." In every region of the country initial settlement tended to follow the same basic formula; groups of people from a particular area in Europe - East Anglia. the Scottish borderlands, Western Norway, County Cork, and so on - came to America and settled together, sometimes establishing a village or town, sometimes adding to a community founded by pioneering friends or relatives, sometimes taking up farms in an area inhabited by erstwhile neighbors, and sometimes taking their place in "friendly" urban ghettoes next door to fellow paisans.

Second and third stage migrations within the country were also characterized, to a substantial extent, by group movement. New Englanders moved to Ohio. for example, and reproduced not only their village greens but much of their social structure as well, and then they did it again in Oregon, Pasadena, and Claremont. On a smaller, more intimate scale the modern migrations of ethno-cultural groups within particular metropolitan areas has often been fashioned so as to preserve much of the "island-like" character of the old neighborhoods in newly built environments(Castells, 1981). Jews locate among other Jews, blacks among blacks, and Irish with Irish, not in quite the same density and not so often because of social necessity imposed from outside, but enough to retain the culturally distinctive character of local areas and to deny victory to the forces of pluralism.

An additional basis of homogeneity within American communities is to be found in the entrepreneurial circumstances of their founding. John Martin(1991) has documented the extensive degree to which throughout 17th century New England investors created towns and brought settlers to them in the expectation of profit. These communities did not have the same degree of religious unity that the Puritan towns enjoyed, but there was little social diversity nevertheless, and for many decades after their creation few conflicts arose within them. Partisanship and other forms of social discord were far more often expressed in the struggles between and among communities and pluralist diversity was largely an aggregate of all the localities taken together.

The Emergence of Local Elites. Much of the social science literature dealing with elites focuses on those who head and/or can draw upon the resources of large organizations, both public and private. For more than a

century now, such a focus has led to an emphasis on those who operate on a national or international scale, commanding resources - mainly capital - that are mobile across political boundaries and exploiting opportunities or confronting challenges anywhere in the world. Both private corporations and nation states have grown to such vast proportions that mere local notables may seem no longer worth bothering with, even analytically. Be that as it may, however, it was not always so. Local elites certainly have had political importance in the past and it may repay us to inquire into the processes by which these elites first emerged. In so doing, I wish to suggest that the circumstances and foundations of elite emergence and status help us explain the historic strength and continued importance of localism in America.

The evidence on recent migration suggests pretty clearly that movement on a significant scale - eg, from one state to another - is characteristic of the upwardly mobile (T.Brown,1988). In what we might call the "Dick Whittington syndrome" the ambitious young leave home to make their fortunes and, as a corollary, those at the top, at least of the corporate ladder and some others as well, will long since have severed meaningful connection with the places of their origin. They have become cosmopolitans if they were not already born into a cosmopolitan milieu of wealth and position. But it was not always so. Before there were great corporate structures to nurture cosmopolitan sophistication there were local elites who attained their status in very different ways.

One path to elite status was the exact opposite of the Whittington strategy. Every American community was created from scratch. It was founded, quite literally, and "Founding Fathers" laid it out, named it, and promoted its early development, whether as entrepreneurs, religious enthusiasts, or land-hungry adventurers(John Martin, 1991). But the turnover was great. What studies we have suggest that in a given decade half the population moved on(Curti, 1959;Thernstrom,1964), but it was those who stayed in those early years who came soon to occupy elite positions(Faragher,1986). They, a few of them, established a store, opened a bank, started a newspaper, and bought up property. It often took only a few years after the initial founding for a quite clearly differentiated elite to emerge, not always much wealthier in cash income than their neighbors, but acknowledged as the "rightful" leaders of the town (Dahl,1961). Others moved on to try homesteading again, to follow the market for labor, or perhaps simply to "light out for the territory," while meanwhile locals had come to dominate the hierarchies taking shape in the communities of the nation.

A second path of local elite emergence involved the shifting character and function of the learned professions. Specifically, the period between the Founding and the Civil War saw the emergence of lawyers, displacing the clergy as community leaders and serving both as advocates of local interests in larger arenas and as connectors tying one community to another through their participation in the formal structures of courts and politics and the informal networks of communication and opportunity that were associated with those institutions. As Richard Brown(1989) has shown, it was the lawyers who were strategically placed to learn what was happening in the larger world and to articulate it as public orators for the edification of others. By the Jacksonian era lawyers themselves were more

and more "democratically" produced, without the trappings of foreign education or other stratifying mechanisms to separate them from the local community, and the explosive growth of local newspapers in this same period further enlarged the cognitive stock of the citizenry, undermining the informational advantages previously monopolized by a more hierarchical order dominated by clergy and gentry.

This critical, if transitional, role of lawyers in the emergent elite structure(Ayers,1992) was important in part because although they were functionally distinct from their neighbors most lawyers were, and until quite recently remained, distinctly local in the scope of their principal concerns. Real estate, liability, and all the other issues of property rights were almost entirely local concerns regardless of the forum in which they might ultimately be resolved, and these were the matters on which most lawyers spent their time. Insofar as lawyers became embroiled in politics it was very often as a logical extension of the task of representing the interests of local clients.

A third source of local elites consisted of business firms that grew to significant size and economic power but remained located in, and in some measure dependent upon the prosperity of, a particular community. Obvious examples from more or less modern times are banks, utilities, and department stores. Their trade and profit were directly tied to the economic health of the area in which they operated, and until recently when many have been absorbed into translocal conglomerates they lacked the mobility of more abstract forms of capital. Since they could not readily move, the leaders of these economic institutions, often the founding families, were necessarily committed to boosting the locality's growth. Even today there are enterprises with such large sunk costs in physical plant or locality-based images associated with their product as to make it an expensive proposition to shut down and move to an area of lower taxes or cheaper labor. Such firms are likely to be local activists. It is clear that mobility is more easily contemplated today than a generation or two ago, and to that extent the underpinnings of local elite structures are weakened. My concern here, however, is to emphasize the historic experience which, in communities across the land, generated influential local elites that were largely autonomous with concerns that for many decades dominated much of the substance of political advocacy and governmental action - and kept it largely local.

<u>The Centrality of Real Estate</u>. There are many candidates for the honor of being designated, "That Which Made This Country What It Is Today," but my favorite is real estate speculation. It is hardly possible to overstate the importance of the decisions to invest in and efforts to promote the value of real property in giving specific shape to patterns of land use and thus to the social configuration of every particular geographic space (Boorstin,1965,1973; Marc Weiss,1987). Natural resource potential sets some of the parameters of development, to be sure, but resource constraints have so often been disregarded or overcome that in most instances we cannot take them to be decisive. And while there are many sources of wealth and achievement besides real estate, the hope that a plot of land and its improvements will, with some promotional effort, increase in value enough to make one's fortune has been a driving motive for many millions of

Americans from George Washington and Daniel Webster to the less honorable scamps of our time (Bailyn, 1986; Limerick,1987)

The proportion of the nation's wealth represented by real property values is enormous. The number of people directly involved in the development, management, and sale of property is vast. Yet despite the publicity attendant upon the recent savings and loan scandals we lack even rudimentary descriptive maps of the extent and character of the real estate "industry" comparable to the numerous studies of the oil business or automobile manufacturing. There is a ready explanation for this gap. Real estate is localized. It is strictly bounded in space and has escaped much of the process of translocal aggregation, enough to keep it a highly decentralized structure, an extremely complex web of connections among investors, developers. brokers. creditors, lawyers, and many others.

Real estate interests are not only located in specific places, of course; they are fixed. They cannot be picked up and moved. To convert them into more mobile forms of capital requires that they be sold. This, in turn, requires a market of at least one potential buyer, and if the sale is to be profitable, it requires that market prices be on the rise. This, in turn, necessitates that demand for the particular property in question be on the upswing, and this, in its turn, entails growth-encouraging promotional efforts by the owners. All this is elementary economics, of course, but historically it has been an absolutely vital part of American political and social life as well as a foundation of economic development.

Not every American property owner bought land primarily as a profit-seeking investment, of course. There have always been many who intended to stay where they were, enjoying whatever productive possibilities their estate might afford but paying little attention to whether land values were rising or falling. The Jeffersonian vision for America was pretty clearly one in which stability and yeomanly virtue were the hallmarks rather than economic appreciation. For Washington, Webster, and ultimately both the Jacksonians and Henry Clay's Whigs, however, the nation's growth meant not just territorial expansion but increase in the value of the territory. Expanded credit through state banks - a Jacksonian policy - and governmentally sponsored internal improvements - Clay's American Program - were aimed in the same direction; more profitable use of the land, economic growth, and community expansion.

I want to stress not just the degree to which economic development in the first century of the American Republic centered on the appreciation of real property values but also the fact that these values were local and that the efforts to inflate them, though sometimes bundled together into a national policy package, as they were by Clay, were primarily local in both political impulse and form of enactment. Dewitt Clinton was not interested in canal-based development in general, only in New York. The railroad land grants were disaggregated to specific roads in specific localities. Campaigns to found a college or build a state prison were explicitly linked to one town rather than another. The "county seat wars" of the Midwest(Schellenberg,1987) pitted one community against another in a struggle to be designated the seat of local government with its expected accompaniment of business growth generated by the presence of courts and lawyers.

We have already referred to the emergence of local elites in the nascent communities of nineteenth century America. Almost always these elites had particularly large stakes in the real estate of their communities and hence in its appreciation through growth. As we noted earlier, the notables arrived early and stayed, gathering property and creating enterprises to serve what they hoped would become a thriving place. They might donate some of their land to build a college or a courthouse or to entice a railroad to make a bend and come through town. In our time this process of locally sponsored courtship of growth-enhancing investment from outside has generally been socialized and undertaken largely by government, but both the motive involved - enhanced property values - and the chief beneficiaries - local elites - are essentially the same. And even when the form of the policy objectives is trans-local -e.g., a state program of highway construction, or a national policy of home mortgage insurance - the impact is felt at the level of individual places, and it is largely from coalitions of local contractors, home builders, mortgage lenders, and the like that the requisite political stimulus for national action is derived.

Local Institutions: Sunk Costs and Rich Opportunities. Localism is closely tied to mobility - inversely. Localist perspectives are associated with those who, for whatever reasons, cannot or will not move. An important form of such stickiness involves the sunk costs of capital investment in physical facilities. In a general sense prudent profit-making enterprises can depreciate their physical plant over a reasonable time period and thereby retain a degree of flexibility in the spatial allocation of their capital. Nonprofit institutions are far more constrained, however, and in some rough proportion to the scale of their spatially fixed investment are forced to behave as locals, defending their borders against hostile incursions and hoping that growth will increase their resource base, flow of clients, or whatever they depend on to function. Universities, hospitals, cultural institutions, some churches, and all local governments face these necessities. In their classic period, ca. 1870-1930, local governments enjoyed wondrous opportunities to build administrative offices, courthouses, jails, and assorted other appurtenances(Monkkennen,1988). In much of the country, however, and with some stunning exceptions, this physical infrastructure has long since been in place and today presents a two-ply strand that ties local officials to their specific space. Not only can they seldom afford to build anew their capital plant, but by definition they are restricted in the territorial scope of their authority. Governments cannot pick up their jurisdiction and move to more promising venues. They are stuck where they are, and they must act to make the best of their location(Castells,1983; Logan and Molotch,1987).

Local governments may be seen from another angle, however; not just as an immobile investment that cannot be written off or abandoned but as a set of opportunities. Throughout the history of the United States every community founding carried with it the creation of offices, of positions that had to be filled by residents of the community(Elkins and McKittrick,1953). Some of these were paid, some carried a measure of power, some were largely honorific; many were vehicles of recognition and/or advancement of local elites. Long before there was much interest in pursuing congressional seats, for example, state and local offices were

hotly contested, and the redoubtable Plunkitt(Riordan,1948) was hardly alone in "seeing opportunities" in local politics and taking them. It would surely be an exaggeration to claim that the half-million or so local elective offices of the present day all constitute opportunities for advancement or that the remnants of patronage that remain are likely to lead very many people on to fortune. But it is also surely true that in the American past local positions have often been significant building blocks of personal and group upward mobility, and to some extent they still are. And, in the context of this paper, the appeal of such local opportunities has certainly helped keep our politics local.

A Localist Labor Movement. An important consequence of the late nineteenth century emergence of large cities in America and of their attendant "opportunities" was the parallel growth of a labor movement that was also highly decentralized. With few exceptions the industries in which unions were able to organize successfully were local. They had success in the building trades, printing, street railways, brewing, and local haulage but not generally where, as in steel, large national firms had come into existence. Railroads are a special case, and so to a degree is mining. Nevertheless, whereas the collapse of the Knights of Labor illustrated the extreme difficulty of organizing a truly national labor movement, the AFL was able to cobble together a viable confederation of autonomous unions composed mainly of largely autonomous locals operating in particular communities. Moreover, in many of those communities, including Chicago, St.Louis, San Francisco, and others, local unions were able to arrive ar a satisfactory modus vivendi with local political leaders so as to secure a reasonable degree of neutrality from the courts and the police, some degree of influence over appointments, and sympathetic treatment in fashioning local government regulations.

At the national level such political impact was generally beyond the reach of labor, so it made sense for the AFL to pursue its general strategy of opposing governmental intervention, even on welfare issues. The unions lacked leverage in national politics, but in any case the arenas that mattered most to the AFL constituents of those days were local. Not until the formation of the CIO in the mid-1930s did nationally-oriented unions come into lasting existence bringing with them an enthusiasm for political mobilization that would bear upon national politics and national policy questions. And when that happened the tension between the localist branch of the labor movement and the nationally oriented activists was brought into sharp relief from which it has not, even today, entirely escaped.

The Recurrent Flight From Diversity. We have stressed the importance in shaping the American sense of place of "island communities," culturally homogeneous settlements that were the prevailing pattern during so much of the three centuries of the nation's development. Indeed, as new suburban enclaves, erstwhile urban railroad yards, and assorted Sun Cities and Leisure Worlds come into existence where nobody lived before, the process continues today. Each of these projects tends to be inhabited by people who at the very least are much alike in terms of social class, and other dimensions of social identity including race and ethno-cultural background are also more often the bases of unity than of diversity.

Throughout our historical experience Americans have displayed a powerful tendency to reproduce communities with a high degree of cultural homogeneity. Not only did we tend to settle in islands(or ghettoes) initially, we recreated them if and when we moved. Newly built neighborhoods in our cities attracted residents of similar class and ethnic background, often former neighbors from older parts of the city indeed. Sometimes restrictive covenants helped out, to be sure, but in any case selectivity was aided by price level, propinquity, and prior acquaintance. Suburbanization was and is an elaboration of this process, sorting out urban residents - and it is incidental, in a sense, whether the area in question is inside or outside the formal boundaries of the core city - not so much on the basis of their preferences regarding collective goods, as Charles Tiebout(1956) contended, as according to who they were, socially and culturally. Italians went one direction, Irish another, Jews a third, and so on, as WASPS had done before them(See Weiher, 1992; Castells,1983). Suburbs differed from ghettoes, of course, because their boundaries and social composition were self-imposed, not forced upon the residents by others. Suburbs differ from homogeneous neighborhoods also by virtue of their authority to implement some of their shared values as governmental jurisdictions, though insofar as neighborhoods are effectively organized politically and, for example, bargain as wards a la Chicago, that distinction may only be one of degree.

The historic stress on creating and reproducing residential communities characterized by essential value consensus generated by commonalities of ethno-cultural identity and social class position is responsible for some highly significant features of American life. Since communities tended to be homogeneous while many of the larger spatial aggregates - states, regions, and the nation as a whole - were quite diverse, a major dimension of political conflict has been between and among communities rather than within them. Truly local(though not big-city) politics in the United States has tended to be consensual and administrative, often dominated by local elites to be sure and unmindful of such fragments of diversity as might live at the edge of town, but rarely productive of group-based animosities and even less often the locus of partisan struggles(Wood, 1959).

Where there is local homogeneity there can be no meaningful pluralism, of course. Political scientists seem to have assumed that because there was social diversity in the national aggregate there would be also in its component parts. In most of the historic past that was simply not so. Moreover, many of the institutional arenas where key social processes occurred - religious worship, for instance, or elementary education - were locally controlled. When the communities were not pluralistic in their composition, disputes among contending groups regarding what was constitutionally permissible practice simply could not arise. No one challenged the consensus. Hence, no cases went to court and no First Amendment jurisprudence developed until quite recently. There has been a veritable explosion of rights litigation in recent decades, of course, and the social process that has been its underpinning is the pluralization within local governmental jurisdictions.

The historic American "flight from pluralism," the recurrent effort to create communities that were socially homogeneous and consensual, has been

falling farther and farther short of its goal. Part of this results from the continuing expansion of population and the consequent increase in numbers and types of people resident within jurisdictions. Congressional districts, for example, are nearly twice the size they were just before World War II, and many places that until quite recently seemed to be genuine communities have become complex SMSAs. Larger numbers almost inevitably mean more variety. Especially will this be true when the laws forbid most forms of discrimination in residential choice apart from price.

The emergence of local pluralism has also been aided by the difficulties many local jurisdictions have had in securing the resources necessary to pay for the collective goods their residents demand. As education, medical care, physical infrastructure, and assorted other amenities grow more expensive and the mobility of capital threatens the viability of every area's real property tax base, neighborhoods look to the city, cities look to the state, and states look to the nation for help. Every shift in level entails a further pluralization of the politics and the possibility that in the ensuing conflict any particular group may lose. And so, despite the resource problem, there is a reluctance to let issues escape to larger jurisdictions. Both the NIMBY phenomenon and the resistance to tax increases at state and national levels reflect this tension between such local homogeneity as survives and the greater diversity of larger political arenas. Mr. Madison might very well have a sense of deja vu all over again.

The Differential Impact of Public Policy. It may seem a bit paradoxical but the growth of national governmental programs has strengthened the centrifugal power of localism. The reason for this ironic effect is that most public policies affect specific geographical areas differently(Bickers and Stein, 1991). Given that the localities are not alike in their resources or their socio-economic and cultural configurations, it is inescapable that whatever government undertakes and however uniform the terms of its writ, the benefits and costs will fall unevenly across space. This is obvious enough when the policy involves a naval base, commodity price supports, or a housing project. Something that is built(or closed) in one place cannot be somewhere else. Subsidies that go to farmers in one part of the country or price controls on natural gas producers in another section have obvious local impact. But even policies that apply broadly to all similarly situated interests - federal gasoline taxes, for example, or college student loans - fall differentially upon different parts of the country(as well as among different income groups, of course), as is made evident by the congressional voting patterns on these issues.

Geographic spaces are not the only units that public policy affects differentially. Institutions such as corporations, universities, and local governments often react in quite singular fashion to the potential incentives and burdens of policy initiatives, depending on their circumstances, and although they try to construct coalitions that can aggregate their political strength and improve their chances of favorable treatment, the centrifugal pressures resulting from their particularities tend to be very powerful. And most of these institutions have quite specific and highly delimited spatial locations. Racial and ethnic minorities are also distributed very unevenly across the map, and this

further strengthens the disaggregative tendencies of policy. Social class, on the other hand, is such a broad and loose construct that is difficult to locate spatially. Apart from some of the wealthy suburbs, at one end of the spectrum, and the industrial slums at the other end, few political units are so clearly rich or poor as to enable an unambiguously class-based response to appear in their politics. Indeed, the power of localism - spatially differentiated political action and reaction - helps undermine the effectiveness of class as a foundation of political consciousness and mobilization in the United States.

The persistent power of localism helps explain why so much of U.S. public policy is cast in broadly distributive form, dividing the benefits among a wide array of recipients and also spreading the costs as widely as possible, even into the far distant future(Lowi, 1964; Schattschneider, 1935; Salisbury, 1968). Some largesse goes directly to individuals, of course, but much is allocated to cities, counties, congressional districts, and states so that officials from those areas can claim credit for the good fortune. It is less common for costs to be allocated with similar exactitude, as credit for paying the policy bills is not eagerly sought after.

So It All Comes Back to Politics

It would not matter very much if localities differed from one another in their social composition unless those differences could be expressed with meaningful force in the arenas where authoritative allocations of values are determined; i.e., in politics. This is not quite as obvious as it sounds. Simply because there is diversity of interests among local areas there may not be corresponding political articulation in terms of those interests or areas. No such correspondence is expected in authoritarian regimes, for instance, and even in democratic systems strong national political parties can build broad coalitions that transcend and may give short shrift to local concerns. Alternatively,in a system with powerful interest groups the interests associated with specific areas may lose out to those of broader scope. Skocpol(1992) argues, for example, that nationally coordinated campaigns of the GAR and later by the Anti-Saloon League, the WCTU, and the General Federation of Womens Clubs overcame localistic parties to enact a variety of "welfare" policies during the late 19th and early 20th centuries.

Localism gets its most powerful expression through structures of governmental authority in which local units are substantially autonomous, undominated by more inclusive or encompassing authorities, and are able either to function effectively on their own or to keep a priority position in a structure of representation. I will not speculate as to whether institutional localism is the inevitable result of a decentralized social structure, though it would surely have led to unbearable tensions had the Founding Fathers tried to create a fully centralized polity. I do wish to argue, however, that the American institutional design has reinforced and strengthened the tendencies toward spatial differentiation of interests.

The importance of locally circumscribed institutions in shaping political outcomes throughout the nation rests upon several pillars of support. One that we have already discussed is the fact that each local

community is served by officials and other elites whose prospects for success are closely bound up in the progress of that place which they seek to advance at every opportunity, political or otherwise. A second is more attitudinal. It is the ancient American belief that local institutions come closer to the ideal of self-government and are more trustworthy than other layers because they are "closer," more approachable, more controllable(See Berry, et al, forthcoming). It is often argued that consolidation or even abandonment of local units would be more efficient or lead to a broader perspective in coping with the interdependent problems of the polity, but the ideology of localism contends that local autonomy is necessary to the liberty of the citizenry and of superior value to mere efficiency. Closely related is the factor we noted near the beginning of this paper; to wit, the affective attachment to or identification with "home places." It is ironic that in the development of American legal doctrine the authority of local government has come to be placed under rather severe constraints, far more limited even for "home rule" communities than state or national authorities must suffer. But despite the excesses of diverse local officials that provided much of the political context for Judge Dillon's Rule and its narrow view of what localities could do, the sanctity of local autonomy remains largely intact as a popular concept.

However well-regarded local government may be in the United States, localism would not have such impressive political impact were it not for "O'Neill Factor," the fact that nearly every elected public official in the country is chosen by and owes office exclusively to a local constituency. No party or regime can put someone in office for more than a few months without the approval of the local district or state voters. No surplus votes can be carried over from one area to help a needy candidate somewhere else. Ambitious candidates and strategic parties cannot shop around. They must stand where they live. And each person elected must reckon with his or her perpetual dependence on the approbation of one and only one specific, geographically defined, aggregation of voters. Every representative must therefore satisfy the desires of a large group of voters in the locality, and it is thus fundamental in this kind of electoral system that spatial configurations of interests rather than those based on function,ideology, or social structure will be the foundation of representation.

This means, in turn, that representatives will behave in ways that connect their official modes of behavior, such as framing policy initiatives, advocating one course of action against another, and ultimately taking authoritative decision, to what they perceive to be the desires and needs of constituents, their geographically-bounded bases of support. Some of these connections may be made in largely symbolic terms; speeches of congratulation to local high school heroes, nostalgic homage to area antiquities, hand-shaking at traditional picnics and barbeques, and so on. At another level, touching base with local elites of various kinds can be seen as signalling one's commitment to the "home place." Whatever its motivation, however, cultivating the constituency is a fundamental of American politics and integral to our localistic form of democratic practice.

Representatives who depend for reelection on local voter approval will find it appealing to claim credit for policies and programs that are thought to generate positive flows of benefits to, or retard negative

effects upon, the constituency. Credit may be claimed and blame avoided at many levels of generality, of course. Some beneficiaries are specific individuals or institutions for which policy has been tailored or bureaucratic obstacle surmounted. Sometimes, it is broader groupings for whom jobs are retained by virtue of a contract renewal, say, or which benefit disproportionately from a legislative enactment such as common situs picketing. Generalized public opinion on issues such as fiscal policy or election finance reform can be appealed to at the level of one's constituency too, but it is more difficult fully to differentiate that kind of appeal. Consequently, such issues tend to evoke partisan voting patterns in the legislature. Inasmuch as incumbents were ipso facto successful in their partisan election campaigns, it is quite sensible for them to vote with their party when no clear differentiated constituency benefit position is available.

The need for differentiated credit claiming leads to the framing of policies in forms that maximize the chances to meet the need. Appropriation of money is always popular because it provides a nicely fungible basis for district-specific satisfaction. Bricks and mortar programs may be even better because they can produce tangible and lasting monuments to the particular officials whose valiant efforts secured them.

Nevertheless, as officials do not spend all of their time on constituency satisfaction (Fenno. 1973; Mayer, 1991;Cox and McCubbins, 1993), and not all American public policy is cast in such terms. Some entitlement programs, for instance, like old age assistance or medicaid are not readily translated into district specific terms, nor is something like interest on the debt. Moreover, legislative party leaders and executive branch officials bring their own pressures to bear which, coming from outside the specific confines of member constituencies, push toward more broadly based coalitions based on factors other than simple log rolls. Nonetheless, the long term growth of government in magnitude and cost has been accompanied and, arguably, driven by the desire of representatives to serve their constituencies, and as Hansen(1991) has shown, the weakening of political parties as mechanisms of electoral success has increased the need to turn toward district-specific policies. In some policy areas, to be sure, cost and complexity have overwhelmed the capacity of elected representatives to manage them. Military pensions for Civil War veterans are a good historical example (Ainsworth, 1993; Skocpol,1992)), The volume of those requests grew so large and lobbyists so skilled at brokering them that Congress finally was induced to pass legislation turning the whole matter over to impersonal formulas and abstract principles administered by faceless bureaucrats.

Not all officials are constrained by spatially circumscribed constituencies. The leading figures in the executive branch are not, at least not as sharply as legislators, and they may therefore frame both their rhetoric and their policy proposals in less geographically differentiated terms. Presidents, governors, and mayors speak more often of macro-social problems and macro-economic effects in counterpoint to legislative emphases on the conditions in particular districts and the needs of specific constituent groups. In addition, however, there is great variation among constituents in the extent to which they are bound to a particular locality. Business corporations and trade associations are

typically located in several subdivisions of our political geography, and insofar as their capital resources are mobile they can and do retain much flexibility regarding the locational effects of public policy. Labor unions are considerably less mobile, on the other hand, and, as we noted earlier, they tend to function as locals politically as well as organizationally and to work most closely with legislators.

At one time the difference in orientation between locals and cosmopolitans was the focus of considerable research(Hacker, 1961; Huntington, 1973), and generally the distinction seemed to cut rather clearly between legislative and executive branches and to differentiate between political careerists and elites in business and other forms of private pursuit. That research thrust seems to have been largely abandoned, perhaps on the assumption that one of its strongest social foundations, growing up in rural or small town circumstances versus a metropolitan background, had largely disappeared in the wake of the comprehensive urbanization of the 20th century. The argument advanced here, however, rests the local-cosmopolitan tension more on structural grounds rather than personal variables. It is the source of political support that counts. but its effects are very like those that once were grounded in the socialization experiences of officials. In any event, the research question might be reopened with profit.

I would not want to be understood as suggesting that legislators seek nothing but pork for their constituents while broad-visioned executives articulate the true public interest. That way of putting things may capture the case rhetorically for those whose interests are currently served better by the executive, and, of course, partisan considerations regularly intrude as well to color or mask the geographical effects of policy decisions. Further, it is clear that fiscal factors operate in compelling fashion to constrain both localist forces and "others." (I hesitate simply to adopt the term "cosmopolitan" to label the "others." The word implies more ton and sophistication than sometimes is warranted, but I have not as yet come up with anything better suited to my purpose.) Budget deficits, tax burdens, and the competing demands from worthy programs all limit what can be done to satisfy any constituency interest however it may be structured spatially.

A good many programs are framed, in effect, at two levels simultaneously. At one level they are cast in terms of macro-social needs and concerns, while at the same time their particulars contain district-specific substance. Defense policy provides an excellent example of a program that operates on both levels at once in motivation and impact. The "strong" defense efforts of the Reagan years and the cuts in spending more recently can be understood in terms of broad foreign policy objectives and the realities of international realpolitik and, as well, by reference to ideological orientations toward the "Evil Empire." But the effects of both spending and cutting on local areas around the country are profound. Base closings and procurement contract decisions are inextricably tied in with the macro issues of how to position the United States to cope with the post-Cold War world and, at the same time, deal with the deficit. Similarly, farm policy has always involved specific commodity support programs with broader objectives of strengthening the economy and preserving some of the virtue-inducing social foundation of rural America.

Tax issues combine macro questions of fairness among broad income classes and overall revenue generation with issues of differential group effects and the plight of very specific industries and even individual firms. Localism does not always dominate the formulation of these policies, of course, but it is invariably present in the process, especially in that portion that takes place in the legislature's halls.

Structure Is Not Enough: The Attitudinal Component

A rational utilization of election-induced political opportunity to advance the interests of groups and elites thereof within local communities may account for much of the observable patterning of American policy formation. It would be surprising, however, if citizen sentiments of loyalty and affective attachment were not also present to reinforce and help legitimate such rational practice, economists' theories notwithstanding. In this concluding section I want to suggest that somewhere in the penumbra of our political affections are attachments that bind real people to particular places, ties of devotion that motivate citizens to frame their sense of their own best interests in terms that are expressed or articulated in the language of place. Inasmuch as we lack much social scientific understanding of these matters, I shall try here only to sketch a framework of research that I hope may eventually improve our grasp of the attitudinal foundations of political localism.

Essentially, attachments to place may be instrumental, affective, or some combination of the two. Insofar as they are instrumental, some kind of self-interest may lie behind the place loyalty. That is, people may be psychologically tied to a location because their economic or social values are thereby enhanced. As individuals they are advantaged by the prospering of the area. If it grows in population or income they will be better off, and so place attachment for them is not really different in kind from other forms of self-interest. Certain kinds of economic and social values are pretty clearly tied differentially to geographically bounded spaces and place loyalty can be an efficient and politically palatable shorthand device for expressing such values. Real estate interests are the obvious example, and it is surely no accident that civic boosterism in all its forms is so often associated with real estate investment. Federal Treasury notes, by contrast, or a TIAA-CREF pension fund has no areal referrent, and if one's money is invested that way one can be quite indifferent to the selective fortunes of various parts of the country.

Much place loyalty undoubtedly has at least part of its roots in economic self-interest. The underlying logic of pork barrel politics is based largely on self-interest assumptions. Congress members bring projects to their districts to enhance the locality's economic well-being, hoping that voters will conclude that they are better off because of the federal bounty and vote for the incumbent's reelection. Part of place attachment may be more expressive, however, and at least to some degree detached from tangible advantage. As with party identification, religious affiliation, and other forms of affective relationships, loyalty to place may not only be emotional and deeply felt in its form but significantly grounded in non-economic values. We know too little to venture very far down this road, but it does not stretch credulity too far to suggest that "caring" about one's "home town" rests more upon a positive assessment of one's family and

formative background than with one's present occupation or social location. For example, and recurring to our earlier reference to the local v.cosmopolitan contrast, it may be that those who grew up in small towns retain certain value orientations quite different from big city products regardless of where they live now. It is apparent, at the very least, that in this age of ubiquitous spectatorism the crowds of loyalists that back home town and home state athletic teams attest to the power of localism as an expressive feature of American life.

But the question remains; do place attachments have an independent impact on politically relevant attitudes and behaviors, an impact that cannot be reduced to economic self-interest without severe distortion? Do people vote differently as a function of their loyalty to their home town? Are certain values or preferences derived from the context in which they grew up or live now? Do they participate more actively if they are long-term residents, or accept civic responsibilities more willingly if they grew up in small towns? There may be diverse and complex answers to these questions and others we might propound, but in order to make progress we must also face another troublesome issue; namely, what do we mean by place.

There is a story that is told about several different baseball umpires of the old school who, when challenged by a rookie on a ball-and-strike call, replied,"Son, until I call 'em, they ain't nothin'." George R. Stewart (1958) has reminded us that in America's beginnings there were no names for any place, natural or manmade. The Indians didn't use names as Europeans did. Every place had to be given a label in order for it to have a distinct identity, and so literally millions of namings have been required in this "New Land." Indeed, from 1890 until 1947 there was a federal Board of Geographic Names to supervise the naming process. Wallace Stegner(1993) adds that in addition to a name, "No place is a place until things that have happened in it are remembered...." Stegner was of the opinion that the "process of cumulative association" had given most of the nation reasonably stable identities by now except in the West where transiency and continuous social and economic change had stunted the growth of collective memory. The questions are empirical, of course, but I believe they are both interesting and important and we could surely get more exact answers.

An American voter, looking around a polling place on election day, will have no difficulty identifying several different "places" of which that particular location is a part. Municipality, county, state, and nation are the most obvious. Congressional district, assembly district, judicial district, and a variety of other special purpose districts also call for voter attention. Then there are the somewhat less formal but often compelling micro-locations of neighborhood, street, and block, and that historically evocative macro-place, region. If voters were asked about place attachments -e.g.,"Where are you from?" - which of these many options would they select. If, as seems likely, they identified with several combinations of space simultaneously, in what sort of hierarchy of importance would these be organized? Would place attachments be more compelling regarding taxes or other domestic issues than on foreign policy? Would local ties weigh more heavily on issues of school spending than on health costs?

To some of these questions we may have some reasonably firm expectations, but for the most part we must admit that at present we simply do not know. We do not know how extensive or how deep the attachment to place may be among Americans (or anyone else, for that matter). We know little about how place attachment is distributed around the country, and we can only guess at how far the symbolic expressions of place loyalty are masks to hide more tangible self-interests.

We do know that place is and has always been an important part of the rhetoric of our politics. The many forms of expression employed to capture the meanings we give to the geographical slices of our lives are among the most powerful metaphors of our political vocabulary and have been throughout our history. Colony, state, nation; city, county, town, district; neighborhood, ward, block; states rights, creative federalism, home rule, the union forever! I, for one, would like to know more about what meanings these load-bearing terms have for Americans who use them every day and give every indication that they matter.

I. INTRODUCTION

Years ago, a movie studio mogul is said to have rejected a script on a social problem with the dictum: "If you want to send a message, call Western Union."[1] Such an attitude has been typical of the industry's general approach to films with political themes. More specifically, motion pictures dealing with the American political system are truly rare.

The very assumption underlying Hollywood's reluctance to embrace political vehicles makes film a valuable source of study for political scientists. Since audiences tend to see movies as sources of entertainment and not for their educational content, they are not likely to flock to theaters featuring films with political themes, especially if the ideas discussed on the screen run contrary to their own values and attitudes. Given their considerable cost, movies must cater to the largest common denominators if they are to be profitable. In their intermittent ventures into political waters, filmmakers would be expected to project messages which are inherently congruent with the views of the majority of the public. It is therefore instructive to analyze the content of political films in search of common themes.

Since all films contain political ideas, a comprehensive review of politics in the cinema would be an unmanageable research enterprise for a single investigator. Conversely, if social scientists handpick only those movies which interest them, their conclusions would be limited to what may be partial snapshots of the studios' outputs. To avoid both problems, I have limited my inquiry to fictional films which specifically purport to represent major actors within the American political system.[2]

In the past sixty years, American studios have issued fewer than 20 films which deal with the American political system.[3] Of these I have evaluated 16 and listed them, together with summaries of their plots, in the Appendix; readers unfamiliar with the movies may wish to peruse through the Appendix before examining my findings. The paper begins with a review of the predominant principles that I identified in the films and concludes with a brief analysis of the significance of these motion pictures as agents of political socialization.[4]

II. GOOD SYSTEM, BAD PEOPLE

The dramatic structure of a work of fiction generally consists of a conflict between the forces of goodness and virtue (usually the heroes) and those miscreants who act with evil intent (the villains). In a political setting, these crises are usually the byproducts of actions by individuals and never associated with structural defects in the system. Problems are

often solved by merely extricating the wrongdoers from their positions of power. Invariably, the movies pay lip service to the marvels of the American political system and then go on to blame any failings on the inadequate performance of politicians. Since all 16 films spotlight political malfeasance, their directors and writers must have concluded that audiences would have no trouble believing that politicians are capable of some rather abhorrent acts.

A. The Politician as Felon

In eight movies, political leaders are guilty of major crimes. Their offenses include extortion ("Advise and Consent," "All the King's Men," "The Great McGinty" and "The Last Hurrah"); perjury and subornation ("Advise and Consent" and "Mr. Smith Goes to Washington"); obstruction of justice ("All the King's Men" and "Dave"); bribery ("The Distinguished Gentleman" and "The Great McGinty"); and murder ("All the King's Men" and "Twilight's Last Gleaming").

The perjury in "Advise and Consent" occurs when Robert Leffingwell lies under oath at his confirmation hearings. Charged with having attended meetings of the Communist Party as a young man, Leffingwell denies having done so. Immediately after committing perjury, Leffingwell visits the White House, confesses and expects the President to withdraw his name from further consideration. Instead, the President becomes an accomplice to the crime by insisting that the nomination go forth. It is the chief executive's stubborn refusal to pull back the nomination that ultimately leads to the suicide of Senator Brig Anderson, a man with more acute ethical sensibilities than the President's.[5]

"Dave", the most recent addition to the field of political movies, conjures constitutional crimes of unprecedented proportions. The Oval Office is the site of criminal activities extending from some unspecified illegalities about the savings-and-loans scandal to the monumental charade of concealing President Bill Mitchell's massive stroke and supplanting him with an imposter. The hero, Dave Kovic, is Mitchell's replacement; captivated by the thrill of playing at being President, Kovic does not grasp the chicanery behind the whole enterprise. When he finally realizes what has been happening, he fires the orchestrator of the conspiracy (chief of staff Bob Alexander) and arranges for the Vice-President (untainted by any wrongdoing) to become President. The film's happy ending omits any reference to the ruse perpetrated on the American people or Dave's role in it.

Criminal conduct is at its most shocking in the preposterous "Twilight's Last Gleaming", where President Daniel Stevens is assassinated through the collusion of other members of the executive branch. Evidently displeased because Stevens is planning to reveal the real reason for American involvement in the Vietnam War, military leaders and some Cabinet officers order

sharpshooters to kill the President. The movie ends with the implication that, as in "Dave," the American people will never learn the truth.[6]

B. The Politician as Philanderer

Political movies often dovetail the political corruption of an initially righteous individual with his[7] illicit sexual conduct. This is the case with Willie Stark (who has at least two adulterous affairs in "All the King's Men"), Bill McKay (who sleeps with a campaign worker in "The Candidate"), Joe Tynan (who has sex with a lobbyist); and Grant Matthews (who is openly cheating on his wife even before "State of the Union" begins). Even that paragon of movie probity, Jefferson Smith, is temporarily distracted from his senatorial duties by the flirtatious entreaties of Susan Paine, Senator Paine's daughter.

Some of these femmes fatales may represent more than mere sexual allurement. They are also tools for forcing the hero to abandon his principles and accede to political corruption. Thus, Kay Thorndyke in "State of the Union" cleverly molds her erstwhile lover Grant Matthews into the kind of politician that suits her newspaper's purposes. Thorndyke wants to create enough confusion among the Republican front runners for the 1948 nomination so that Matthews, the candidate her newspaper will promote, emerges victorious (thereby fulfilling a prediction uttered by Thorndyke's dying father in the opening scene: "Kay, you'll make it to the White House, one way or the other").[8] But the grand plan is quickly jeopardized when Matthews, in his very first campaign speech, makes a stirring appeal to labor union representatives, pleading with them to abandon short-term concerns for the sake of the national interest. Such unorthodox perorations arouse concerns among Matthews' political advisors, especially since their candidate is planning another controversial address for his next appearance. Scheduled to meet with business leaders in Detroit, he warns:

> I yelled my head off about labor and its responsibilities. Well, I'm going to lay it right on the line for industry, too. They are going to hear that capitalism itself is being challenged and if it doesn't survive, it's because men like themselves haven't had the guts and the imagination to make it survive.

But after an off-screen tete-a-tete with Thorndyke (who has rushed to Detroit to re-establish control), Matthews comes back ready to accept the speech which seasoned political strategist Jim Conover has prepared. Instead of challenging his audience, Matthews ends up with a traditional pitch: "The palsied hand of bureaucratic control must be removed from the throttle of industry. ... Industry is not a felon, it can no longer be treated as

one by the binding shackles of government." It will remain for Mary Matthews to recognize this shift ["Up until last night, you had something to say. You had courage. ... The people were for you. But not anymore. You've changed and they'll know it"] and ultimately rescue her husband from "a gang of corrupt politicians."

C. The Politician Redeemed

Mary Matthews is only one of several women who rehabilitates the leading character in a political movie. In "Mr.Smith Goes to Washington," Jefferson Smith is rescued by Senate staffer Clarissa Saunders on two separate occasions. Angry that the naive Smith has been taken in by the glamour of Washington life, Saunders first tells him that his appointment to the Senate was nothing more than a maneuver to slip through a dam project which would enrich boss Jim Taylor. "That's why they sent you in here in the first place, because you don't know a dam from a bathtub." Days later, when a beaten and dejected Smith is headed home, Saunders finds him weeping at the Lincoln Memorial. Suitcase in hand, the disillusioned Boy Ranger wants to "get away from the whole rotten show," until Saunders patiently urges him to stay and fight, setting the stage for the movie's climactic filibuster.

Similarly, in "All the King's Men" Willie Stark only realizes that he is being used by the party bosses when Sadie Burke explains it to him and thereby transforms the dull and inhibited reciter of "facts and figures" into a dynamic orator who practically intimidates his audience into paying attention.[9] When "Dave" seems beaten by the machinations of the evil White House chief of staff, it is the wife of the comatose President who persuades him to continue the hoax in order to implement his legislative agenda. Thomas Jefferson Johnson, a previously sleazy con artist in "The Distinguished Gentleman," emerges as a sensitive reformer through his contact with Celia Kirby, a young public interest lobbyist. Despite the large amounts of illegal funds he is receiving from political action committees, Johnson lets Kirby know that he is developing a conscience: "After I met you, the better I do, the worse I feel." Dan McGinty, an ambitious petty criminal, also undergoes a corrective metamorphosis after marrying his secretary in "The Great McGinty." And in "The Farmer's Daughter," maid Katrin Holstrom uses her encyclopedic knowledge of local politics to raise the consciousness of Congressman Glenn Morley who, before her arrival, was an obedient party member, blissfully oblivious to the organization's corruption.[10]

D. Politicians in Groups

Political parties have fared as badly in the hands of

Hollywood as have individual politicians. In the four films in which a party figures prominently, it is usually seen as a powerful machine functioning for its own benefit. In two instances, the party seems little more than an extension of a particular candidate or leader. Jim Taylor, the boss in "Mr. Smith Goes to Washington," has command over the party in Smith's home state. By censoring news reports coming out of Washington and manufacturing disparaging telegrams and telephone messages, Taylor and his cronies thwart Smith's herculean filibuster. Likewise, the party in "All the King's Men" exists merely to carry out Willie Stark's directives. Once Stark becomes governor, he seems to turn state employees into his own private minions.

In two other movies, the machine is less powerful, but just as anti-democratic. The Republican party in "State of the Union," is reduced to a coterie of interest group representatives who concoct secret covenants in appropriately smoke-filled room. Neither party in "The Farmer's Daughter" comes off favorably. One of them accepts Katrin Holstrom as its candidate purely on the basis of her vote-gathering potential. This is how the state party leader sums up her candidacy:

> She's wholesome looking for the women; a servant girl for the labor vote; corn-bred for the farmers; Swedish for the foreign-born; and for my money, she's got something for the men. We've got nothing to lose.

In other words, a party will select candidates exclusively according to their ability to galvanize the public. Not once does anyone raise Holstrom's lack of political experience or suggest inquiring about her legislative or representative skills. Holstrom's adversaries (which include the man she is destined to marry, Congressman Glenn Morley) fare even worse. Their party nominates Anders Finley, an alderman with such a shoddy record that Holstrom humiliates him at his very first campaign appearance by simply quoting newspaper reports. Despite Finley's questionable past, the party bosses stick with him and later, they even stoop to publicizing a false rumor about Holstrom's sexual practices. Only after Finley has been unmasked as a member of a bigoted Klan-like organization does the party belatedly disown him and endorse Holstrom.

In keeping with their decline in real life, the national parties have disappeared from political movies in the last four decades. Last year, two movies ("Bob Roberts" and "The Distinguished Gentleman") accurately portrayed political campaigns as created, supervised and executed by the individual candidate's own organization, with no references to a party.[11]

III. YOU DON'T NEED A SCORECARD

The individuals and issues in political films are packaged in such a way that the least discerning viewers will be able to identify which characters are worthy of their sympathy as well as their scorn. Through casting assignments[12] and the over simplification of issues, the villains in these movies might as well have donned the dark attire that was a fashion requisite for wicked gunslingers in old Westerns.

A. Simple people

As befits fictional stage or film properties, practically all of the scripts feature clashes between obviously sympathetic individuals and equally conspicuous foes. A review of the central adversaries in each movie demonstrates this striking imbalance. "Advise and Consent" offers the dignified and honorable demeanor of Vice President Harley Hudson and Senator Brig Anderson in juxtaposition to the underhanded methods of Senator Fred Van Ackerman. The genial Everyman of "Dave" has to rid the executive branch of an irascible and crooked chief of staff. Mayor Frank Skeffington, Governor Dan McGinty and Congressman Thomas Johnson do not bring unblemished records to "The Last Hurrah," "The Great McGinty," and "The Distinguished Gentleman," but they are waging battle against the likes of a cold-hearted banker, a crooked political boss, and a treacherous grafter, respectively. War hero and self-made millionaire Grant Matthews in "State of the Union" has to wage battle against the implacable efforts of his former mistress, publisher Kay Thorndyke (a woman who prides herself in "never getting sentimental," ridicules "the little chains of middle class morality," and summarily dismisses her entire editorial board when it presumes to question her judgment). The idealistic and gullible Jeff Smith is nearly destroyed by the seemingly omnipotent forces of greedy tycoon Jim Taylor in "Mr. Smith Goes to Washington." Not quite as fortunate as Smith is Daniel Stevens, the most unpretentious and self-effacing President since Calvin Coolidge, who is murdered by a cabal of cowardly officials bent on perpetuating a governmental cover-up in "Twilight's Last Gleaming."

The only persons courageous enough to stand up against megalomaniacal Governor Willie Stark in "All the King's Men" are an ethical judge and a dedicated physician. In "Seven Days in May," an overworked President must outmaneuver a maverick Air Force general who is about to subvert the constitution. The thoughtful and urbane Bill Russell is matched against a single-minded and obdurate senator in "The Best Man." Incumbent Senator Brickley Paise, a model of reasonableness and refinement, is challenged by "Bob Roberts," whose plastic smile and homespun ditties aside, is a crude and opportunistic fraud. A youthful and compassionate Bill McKay runs against Crocker Jarmon, a slick purveyor of political cliches, in "The Candidate." The All-

American wholesomeness of "The Farmer's Daughter" is matched against a racist bigot who resorts to slander in a futile effort to defeat her. In "Power," a spirited college professor nearly pulls off an upset in a three-way senatorial race in which the stalking horse of a powerful Arab cartel finishes last. Finally, Joe Tynan's nominal rival in "The Seduction of Joe Tynan" is Senator Birney, a man too stubborn to admit that his age and his mental stability should preclude any thoughts of reelection.

B. Simple issues

Should any moviegoers retain doubts as to which characters deserve their sympathies, the array of issues that separates the heroes from the villains will terminate their uncertainty. Half of the movies invoke themes likely to generate sympathetic responses from most Americans. Children's rights figure prominently in six of the movies: "Dave" wants to continue federal funding of a shelter for homeless kids. "The Distinguished Gentleman" is turned into a reformer because the progeny of his constituents are contracting cancer at an alarming rate. Similarly, it is the plight of children living in tenements that persuades "The Great McGinty" to advocate legislative programs designed to help the poor. A low-income housing project is Frank Skeffington's top priority in "The Last Hurrah" and he promotes it by noting the need for children to grow up in a safer environment. Finally, "Mr. Smith" wants to build a federal camp for boys.[13] In all these cases, the heroes' opponents are left with the unenviable task of supporting policy alternatives which would shelve or ignore the well-being of innocent young Americans. As "Dave" puts it when he argues for the funding of shelters and against the Secretary of Commerce's advertising campaign to promote American automobiles: "I don't want to tell some eight-year old kid he's got to sleep in the street so somebody can feel better about their car. Do you want to tell them that?"

In two other movies, racial integration is a major theme. Senator Joe Cantwell, the villain of "The Best Man," grovels for Southern votes under the guise of states' rights. Using the coded language of the period, Cantwell proclaims: "I may not like what they do in Mississippi, but I will fight for their right to run their state the way they want to." By contrast, the Senator's rival William Russell unconditionally supports federally-supervised integration. In "The Seduction of Joe Tynan," Senator Tynan initially promises Senator Birney that he will not lead the fight against Supreme Court nominee Edward Anderson. But when Tynan gains access to a film that shows Anderson making inflammatory racial remarks, he goes back on his word and springs the film on Anderson during the confirmation hearings; the startled nominee never recovers his composure. In what the media proclaim as a political triumph for Tynan, the President withdraws the nomination. By again loading the ideological deck in favor of the hero, the script makes it easier for the audience to

accept Tynan's betrayal of a friend.

On a broader scale, six other films address issues of national and international significance. In "Power," a plan to study and develop solar energy alternatives is at the heart of the Senate campaign in Ohio. The good guys want it and the bad guys (funded by Arab oil money) oppose it. In "Advise and Consent" the salient question is: Should a person who lies under oath be confirmed as Secretary of State? It takes more than two hours, but the movie eventually answers the question in the only acceptable way possible.

The public's right to be told the truth by political leaders is covered in four movies: "Bob Roberts" (there are many unanswered questions about the clandestine activities of Roberts' backer Lukas Hart); "All the King's Men" (where Willie Starks' censorship of the radio and the press has the people at his mercy); "Twilight's Last Gleaming" (where only the soon-to-be martyred President wants the people to finally be told the reasons for U.S. participation in the Vietnam war); and "State of the Union" (where Grant Matthews stops feeding the American people the double talk devised by the political experts).

In "The Candidate," Bill McKay does not follow Matthews' example and ends up saying very little about the issues. At the outset of the campaign, McKay had answered questions unflinchingly: yes, he supported abortion, busing and stricter environmental protection; no, he didn't know enough about property taxes to have an opinion. But the end of the film, McKay is spouting off cliches that are no more substantive than his opponent's rhetorical flourishes; that reduces the voters', and the audience's, choice to one of appearances, personality and charisma. Since matinee idol Robert Redford is McKay and obscure character actor Don Porter plays his antagonist, the outcome of an election based on personal traits is never in doubt.

One film depicts a frontal assault on the Constitution by asking the audience to consider the possibility of a military takeover of the United States government. The coup leader, General Scott, raises serious questions about the President's leadership, the Senate ratification of a controversial disarmament treaty with the Soviet Union and the obligations of military officers faced with a commander-in-chief whose actions may imperil the nation. In order for viewers to be supportive of Scott's insurrection, the script should have provided detailed descriptions of the grave dangers inherent in the status quo. Instead, the movie simplifies the issues in a way that makes the general's concern akin to the ruminations of a beaten political opponent. The President's challenge to Scott ("If you are so unhappy, run for office!") makes eminent sense in the incomplete context provided by the movie. For example, the Senate has heard (and rejected) the gloomy predictions of Scott and his comrades. The drama of "Seven Days in May" flows from the last-ditch efforts of the President to stop the coup without damaging the morale of the military; there is no comparable apprehension about the future of the country if the treaty remains in effect.

C. Simple duties

Perhaps as a logical extension of the notion that public servants seldom act in the best interest of the people who elected them, political movies unanimously blazon the belief that being a member of the government at any level does not require experience. In Hollywood's view of American politics, outsiders with no exposure of any kind to the political process seem preeminently suitable both as candidates and as elected officials. Thirteen of the movies include references to experience as a potential asset for political office and all conclude by praising the inherent qualities of outsiders.

Five men who aspire to the White House do so with undistinguished resumes. Two of them (John Merwin in "The Best Man" and Harley Hudson in "Advise and Consent") were obscure governors of small states; a third is a celebrated industrialist who is openly contemptuous of politics (Grant Matthews in "State of the Union"); the fourth was the reluctant selection of a deadlocked convention (Daniel Stevens in "Twilight's Last Gleaming") and the most recent specimen ("Dave") was in charge of a temporary employment agency before he is hired to masquerade as the President. Since no one in the media, the public, or the executive branch realizes that he is an imposter, "Dave" clearly suggests that by resembling and acting as a president should, anyone can be in charge of the executive branch.

Four men covet seats in the U.S. Senate although they have no political qualifications for the position. In descending order of relevant experience they are: a poverty lawyer who has never bothered to register as a voter (Bill McKay in "The Candidate"); a professor of History--not Political Science!-- (Phil Aarons in "Power"); the leader of a boys' organization (Boy Ranger Jeff Smith in "Mr. Smith Goes to Washington"); and a folk singer ("Bob Roberts"). There are even less qualified contenders for the U.S. House of Representatives and governorships: a maid (Kate Holstrom in "The Farmer's Daughter"); a con artist (Thomas Johnson in "The Distinguished Gentleman"); a small town lawyer (Willie Stark in "All the King's Men") and a hobo ("The Great McGinty").

The amateurs who reach political office in these movies then proceed to perform with remarkable effectiveness. Jeff Smith exposes and presumably destroys the Taylor machine in "Mr. Smith Goes to Washington" and Thomas Johnson uncovers a corrupt politician in "The Distinguished Gentleman." But both Smith and Johnson are outperformed by the spectacular deeds of Dave Kovic in "Dave". By applying a smidgen of common sense and disregarding the restraints which may have impaired a more experienced executive, Kovic keeps a homeless shelter from closing, cuts bureaucratic waste[14] and rids government of a malevolent chief of staff.

IV COMPROMISING PRINCIPLES IS UNACCEPTABLE

With such starkly drawn choices on issues, compromise between competing political camps is not a viable option in most of the films. Those which do refer to negotiated solutions are quick to dismiss them as unacceptable ethical breaches and to brand consensus-seekers as unprincipled weaklings or traitors to their causes.

The central characters in both "State of the Union" and "The Candidate" begin as true defenders of the public interest and then alter their campaigns in order to be successful. Free-thinking industrialist Grant Matthews, is told to tone down his populist rhetoric in order to appeal to the party professionals. (One of them reminds him: "You're not nominated by the people, you're nominated by the politicians," a statement true enough at a time when presidential primaries had yet to emerge to the forefront of the nominating process). Mary Matthews speaks for the makers of the movie when she bristles at that suggestion: "Let him alone ... If you get him to compromise, you'll destroy him; compromise will eat into him like a worm. He won't be Grant Matthews anymore." Matthews dismisses his wife's reservations and seems on the verge of winning the nomination when he reverts to his original independent self just before the end of the movie. He withdraws from the 1948 race, but also warns the political establishment: "I'm not getting out of politics. I'm going to the Republican convention and I'm going to the Democratic convention. ... I'm going after every candidate who compromises and I'm going after every lazy voter who doesn't vote."

In "The Candidate," Bill McKay is not afforded a similar last-minute rehabilitation. Like Matthews, he is initially told that his campaign speeches can be as candid and provocative as he wants to make them. McKay's moment of truth arrives when the polls show him gaining on the incumbent. Should he broaden his appeal in order to win or remain ideologically consistent and probably lose? McKay, without the equivalent of a Mary Matthews by his side, does what he has to do to win and the film ends in a much more ambiguous note than the cheerful "State of the Union."

William Russell is also aware that he should change tactics if he is to win the presidential nomination in "The Best Man." Without hesitation, he rejects the possibility: "All this business of gossip instead of issues, personalities instead of policies. ... If I start to fight like Cantwell, I lose all meaning. One by one, these compromises, these small corruptions destroy character. Once this sort of thing starts, there's no end to it." Russell's sentiments resemble those expressed by Mary Matthews: "A little compromise? That's like saying 'a little garlic.' There's no such thing. The real wealth of the world is in principles, integrity and honesty. ... The world today needs honest men more than it needs presidents."

Yet in reality, the art of amalgamating differing viewpoints into a coherent acceptable policy is crucial to the smooth

functioning of a pluralist democracy. After all, the American constitution was forged out of compromise and the system it created practically compels competing interests to bargain and adjust to opposing viewpoints. Such decision-making is conspicuously absent from the silver screen. Only two of the films even approach a possible defense for this hallowed practice. At one point in "The Last Hurrah," Mayor Frank Skeffington refers to his philosophy of governing: "The trick is to know what the people want and then what you can settle for. You can always promise the first, but really only have to deliver on the second." He is then asked how he accommodates citisens with entirely divergent demands of the system. Skeffington sagely adds: "Then you depend upon man's greatest friend, the compromise." He illustrates his point with an anecdote about the conflicting recommendations he received regarding which personage the city would honor with a statue and how he managed to arrive at a compromise. Such a decision, however, is relatively trivial. On the one issue truly significant to his administration, Skeffington eschews compromise in favor of straightforward bullying. The mayor roars into the staid Plymouth Club and assails the city's bankers for refusing to underwrite a low-income housing plan he favors. His diatribe against the financiers bears no resemblance to the cautious negotiating that precedes the brokered agreements of pluralism.

> It all boils down to the fact that the city is no longer yours, it's ours. You have this musty shrine to your blue-nosed ancestors [the Plymouth Club], but my people have the city hall. And that's what sticks in your craw. You can't swallow it and you can't forget it. Well, I'm going to make you eat it. That housing project is going up as planned!

In "Mr. Smith Goes to Washington," Senator Joseph Paine tries to indoctrinate young Jeff Smith into Washington mores by justifying his involvement with the Taylor machine. In a patronizing lecture, he tells his inexperienced colleague: "Thirty years ago I had your ideals, Jeff. ... But I compromised so that all those years I could sit in the Senate and serve the people in a thousand different ways." Here, at least, there is a realistic illustration of the kind of alternatives that confront a well-meaning legislator. Is the compromise a valuable tool for political leaders or a shameless betrayal of their principles? "Mr. Smith" and all the other films select the second alternative. By associating the compromise with the selfish criminality of a Jim Taylor, a Willie Stark or The Boss, the political movies' heroes are immune to its irrevocable contamination. As Jeff Smith later says: "There's no compromising the truth. There's no place out there for graft or greed or lies or compromises with human liberty." And if there are situations where politicians can reach morally acceptable compromises, they are

not to be found in movie theaters.

IV ENDS AND MEANS

As a corollary to the sanctity of principles, some of the movies go on to disclaim the utilization of extreme tactics even in pursuit of the loftiest goals. Willie Stark's facile explanation in "All the King's Men" ("I'll make a deal with the devil if it helps me carry out my program") is rejected by the unmistakable evil associated with his acts once he is in power. Whatever benefits the people of his state derive from Governor Stark's massive public works programs are overwhelmed in comparison with the graft, corruption and power-grabbing that accompanied them. To Stark, such squeamish objections are hypocritical ("You want to pick up all the marbles, but you don't want to get dirty") because they can always prevent meaningful change. A similar sentiment is articulated by Senator Joe Cantwell when he is questioned by former President Art Hockstader on his qualifications to be "The Best Man."

> Cantwell: You have to fight fire with fire, Mr. President.
> Hockstader: And the ends justify the means?
> Cantwelll: Yes, I believe that.
> Hockstader: Well, son, I got news for you about both politics and life. ... There are no ends, Joe, only means. All that matters in our profession is how you do things, how you treat people and what you really feel about them and not some ideal goal for society.

In the end, when William Russell refuses to sink to Cantwell's level of mud-slinging, the defeated senator replies: "If you don't understand me, you don't understand politics and you don't understand this country. The way it is and the way we are. You are a fool." The outcome of the nomination fight makes clear that Cantwell and his ilk have no place in American politics. "I can't let you be president," avows Russell. "You're worse than a liar. You have no sense of right or wrong, only of what will work."

In "Advise and Consent," Senator Fred Van Ackerman is the quintessential political extremist. Like Stark and Cantwell, he has a gigantic blind spot for the moral price paid in the quest to attain a desirable goal. The petulant Van Ackerman is so convinced that the President's appointment of Robert Leffingwell is vital to the nation's security that he willingly blackmails a Senate colleague and indirectly causes his death.[15] By the end of the film, his party and his fellow senators reject him with such finality that his career as an effective legislator seems to be at an end.

V. CONCLUSIONS

The most striking discovery in evaluating the political content of movies made over a 60-year period is the consistency of their themes. Fashions, language and cinematic techniques have changed through the decades, but the central ideas described above have remained constant: the system is good, compromising politicians are bad, and problems are solved as soon as the right people are in charge.

These values are consistent with the initial hypothesis that major motion pictures with political subjects must reinforce basic ideological tenets. None is more prominent in these films than the superiority of the American constitutional system. The dramatic construction of most political films requires some sort of problem, crisis or conflict which the leading characters (who often find time to fall in love along the way) set out to resolve. These predicaments are attributable to those instances in which evil or incompetent individuals threaten to undermine the American political system. Eventually, the power-hungry anti-democrats are overcome by the actions of honorable people, thereby demonstrating that the system will indeed work if it is in the hands of stalwart citizens.

Inasmuch as movie audiences may represent a cross-section of the American public, they would be in full accord with such a characterization of politics. Practically all U.S. inhabitants (99 per cent) are either "very proud" (89 per cent) or "quite proud" (10 per cent) of being Americans; at the same time, 80 per cent trust the federal government to do what is right only "sometimes or never."[16] Students of political socialization have traced the roots of this "I love my political system, but I hate my politicians" paradox to the intrinsic dissonance between the established myths and traditions through which the society instills patriotism and the political information which individuals encounter as they mature. Just as "Mr. Smith" was disabused of his unquestioning faith by the corruption he found in Washington, so do many Americans become disillusioned with politicians who do not seem to perform according to expectations. Part of the political maturation process seems to consist of a gradual revision or even rejection of the grandiose accounts that American children encounter when they first learn about politics. This shift culminates in the alienation or apathy which prevails among many adults.[17] To the extent that they promulgate the qualities of the system while consistently attacking most of those who hold office, the political movies evaluated in this paper bolster a cynical view of American politics.

The frustration of many voters has been exacerbated by recent political history. For a dozen years, the Reagan and Bush administrations openly repudiated government as a potential source of assistance or of problem-solving. All three presidential candidates in 1992 decried the gridlock which supposedly prevented the federal government from addressing pressing national needs. One of these candidates, H. Ross Perot, endeared himself to television audiences by breaking down issues as

intricate and confusing as the federal budget deficit into a collection of sound bites and flip charts which the average American could readily understand. Such distorted streamlining then forced Perot's two opponents to escalate their own promises and commitments.[18] The concomitant backtracking of President Clinton on some of his campaigns pledges and the subsequent media furor over it illustrate the damage which politicians can sustain in an incremental process which shows no signs of slackening.[19]

The mass media, whether television, radio, newspapers or the movies, miss few opportunities to be critical of politicians. At the same time they seldom educate the public with regard to the operation of the federal government.[20] Political news on television resembles the structure of the films discussed in this paper: "Dramatization, personification and simplification tend to inflate the political expectations of the electorate."[21] When problems go unresolved, undesirable practices are allowed to continue, or campaign promises are broken, the knee-jerk reaction is to blame the politicos. One need not be an apologist for professional politicians to point out that when the system fails to legislate, it is often precisely because it is functioning as it was designed to do. If there are multiple competing interests, no sense of a crisis, a dearth of executive leadership and an uninterested public, the result will be a continuation of the status quo and predictable cries of despair from members of the media who created the expectations in the first place.[22] Seldom do Americans hear or read that the political system, particularly Congress, is most responsive to those who express the greatest interest on an issue--not a bad definition of how democratic systems should function. It should come as no surprise that a large heterogeneous society which prides itself in allowing all citizens and groups an opportunity to engage in political participation may often find itself in gridlock. But by watching any of these political films, the public can come away with the impression that the system's failings are invariably traced to the low caliber of its politicians. The cynicism which is thus reinforced discourages the citizenry from being informed about their government and therefore increases the influence of those who pursue private agendas. Then when those special interests prevail in the public policy arena, skeptical citizens will be further inclined to remain apathetic or alienated. Going to see a political movie will not make them feel any better.

APPENDIX

ADVISE AND CONSENT

YEAR OF RELEASE 1962
DIRECTOR Otto Preminger
SETTING Washington, D.C.
PLOT

The President's nomination of Robert Leffingwell for Secretary of State runs into difficulties in the Senate. Not only is the moderate Leffingwell viewed as an appeaser by conservative senators, but he's actually charged with having once belonged to the Communist Party. Under oath, Leffingwell falsely denies the accusation. Senator Brig Anderson, chairman of the Senate subcommittee reviewing the nomination, learns of Leffingwell's perjury and privately asks the President to come up with another candidate. The President, whose health is precarious, insists that he needs Leffingwell's leadership in foreign policy and, to Anderson's consternation, refuses to withdraw the nomination. Anderson is prepared to unmask Leffingwell as a liar, but he is threatened by anonymous phone calls that allude to a homosexual episode in his background. Fearful of the personal repercussions of such a revelation and yet unable to compromise his principles by voting for Leffingwell, Anderson commits suicide. His unexplained death[23] raises enough questions among wavering senators to produce a tie vote in the Senate. As Vice-President Harley Hudson prepares to break the tie, he is notified that the President has died. Preferring to name his own Secretary of State, Hudson declines to vote and Leffingwell is defeated.

ALL THE KING'S MEN

YEAR OF RELEASE 1949
DIRECTOR Robert Rossen
SETTING Unnamed Southern state
PLOT

Local political reformer Willie Stark is selected by the state party machine to run for governor. The party bosses are only taking advantage of Stark's appeal to farmers to split the rural vote and allow their true candidate to prevail. Stark finds out about the scheme and begins to campaign against the same men who had recruited him. Although he is defeated, Stark uses the experience and four years of organizing at the grassroots level to win the next gubernatorial election. Power corrupts the new governor and he is soon more interested in expanding his personal empire than in benefitting his constituents. Even public work projects become monuments to Stark's largess rather than substantive improvements for the people. Ruthlessly crushing all opposition, Stark breaks the law if necessary. His excesses finally lead to impeachment, but the governor manages to escape conviction. As he celebrates his victory over the state legislature, Stark is shot and killed by a former supporter.

THE BEST MAN

YEAR OF RELEASE 1964
DIRECTOR Franklin Schaffner
SETTING Los Angeles
PLOT

Senator Joe Cantwell (in the Richard Nixon mold) and former secretary of State William Russell (an Adlai Stevenson clone) arrive at the national convention as their party's leading contenders for the presidential nomination. They both hope to secure victory by obtaining the support of former President Art Hockstader. Initially inclined to back Cantwell, Hockstader ends up making no official endorsement and privately working for Russell's nomination. Cantwell has come up with a medical report in which Russell's psychiatrist describes his patient's "breakdown" a few years earlier. Russell's campaign manager has found someone who alleges that Cantwell was a known homosexual during the time he served in the U.S. Army. Cantwell forcefully denies the allegation, but both he and Russell know that even an uncorroborated rumor of that type will destroy Cantwell's candidacy.[24] Russell is torn between resorting to personal innuendo or losing the nomination. He opts for the latter, instructing his delegates to change their vote thus guaranteeing that a little-know dark horse will emerge as "the best man."

BOB ROBERTS

YEAR OF RELEASE 1992
DIRECTOR Tim Robbins
SETTING Pennsylvania
PLOT

Popular folk singer Bob Roberts is challenging incumbent Brickley Paise for his U.S. Senate seat from Pennsylvania. Combining his concert appearances with right wing appeals to the voters and unlimited funding by wealthy industrialist Lukas Hart, Roberts manages to draw even with Paise in the polls. A week before the election, Roberts is supposedly shot by radical journalist Bugs Raplin. He survives the attack, but is expected to be paralyzed for several years. After Roberts wins the election, Raplin is cleared of all charges and there are doubts as to whether Roberts was even shot (he is not paralyzed after all). One of Roberts' extremist supporters murders Raplin.

THE CANDIDATE

YEAR OF RELEASE 1972
DIRECTOR Michael Ritchie
SETTING California
PLOT

Marvin Lucas, a professional campaign strategist approaches Bill McKay, the son of a former California governor, with the idea of running for the U.S. Senate as a Democrat. McKay, who operates a legal aid clinic, is leery of traditional politics, but he is persuaded to run for two reasons: the Republican incumbent, Crocker Jarmon, has effectively blocked most of the

public policy initiatives which McKay advocates and since he is certain to lose, McKay will be free to speak his mind on any issue. McKay wins the nomination against lackluster opposition, but Jarmon is heavily favored to win reelection. As he begins to climb in the public opinion polls, McKay's initially bold and uncompromising statements turn into typically ambiguous messages. His television commercials stress imagery over substance and the less specific his statements are, the closer he comes to Jarmon in the polls. At the end of the film, after McKay has defeated Crocker, he turns to his campaign manager and asks in total befuddlement: "Now, what do we do?"

DAVE

YEAR OF RELEASE	1993
DIRECTOR	Ivan Reitman
SETTING	Washington D.C.

PLOT

When President Bob Mitchell suffers a massive stroke, White House Chief of Staff Bob Alexander and Communications Director Alan Reed decide to conceal the extent of Mitchell's disability. They secrete Mitchell and a medical team to the White House basement and ask Dave Kovic (a look-alike for Mitchell) to impersonate the President for a few days. Alexander and Reed hope to force Vice-President Nance to resign after smearing him with trumped-up criminal charges and to have Kovic appoint Alexander as new Vice-President. Then when Mitchell's irreversible condition is made public, Alexander will become president. However, Kovic becomes interested in policy-making and decides to fire Alexander instead. In response, the ex-chief of staff outlines for the media a long list of criminal acts carried out by Mitchell (and now attributed to Kovic). Facing impeachment, Kovic invents a plan of his own: he appears before a joint session of Congress, confesses to all of Mitchell's crimes, clears Vice-President Nance of any involvement and conveniently "collapses" with what everyone assumes to be another stroke. When Kovic is rushed to the hospital, it is Mitchell's comatose body which emerges from the ambulance. Nance assumes control under the 25th Amendment and Kovic returns to private life. His brush with politics leads Kovic to run for city councilman.

THE DISTINGUISHED GENTLEMAN

YEAR OF RELEASE	1992
DIRECTOR	Jonathan Lynn
SETTING	Washington D.C.

PLOT

When Florida Congressman Jefferson ("Jeff") Davis Johnson dies of a heart attack, Thomas Jefferson Johnson runs for his seat as "Jeff" Johnson. The new candidate is a petty criminal who, together with a group of associates, makes a living through confidence scams. Despite his failure to make a single public appearance, Johnson is elected on name recognition alone. He sees membership in the House of Representatives as a golden

opportunity to reap personal gains through political action committees and wealthy contributors. Once in Washington, Johnson comes under the tutelage of Dick Dodge, another Florida Congressman. The chairman of a powerful House committee, Dodge introduces Johnson to a world of high living and an endless stream of illegal funds. Johnson and his cohorts are delighted with their good fortune, but things change when a constituent brings her cancer-stricken daughter to their office. The woman claims that electric power lines have been built in close proximity to a children's playground with a resulting higher incidence of cancer in the neighborhood. Realizing that Dodge and his business supporters will oppose any efforts to relocate the power lines, Johnson decides to expose his mentor. Through the kind of elaborate con game in which he excels, Johnson traps Dodge into admitting his corrupt activities on videotape. Dodge goes to prison and Johnson, his own criminal past revealed, leaves Congress.

THE FARMER'S DAUGHTER

YEAR OF RELEASE 1947
DIRECTOR H.C. Potter
SETTING Unnamed Midwestern state
PLOT

Kate Holstrom, a Swedish-American young woman, is hired as a maid by the mother of U.S. Representative Glenn Morley. When a Congressman from the same area dies unexpectedly, Morley's party designates Anders Finley to run in the special election called by the governor. Holstrom, who has already impressed her employers with her political awareness, attends Finley's first rally and asks such pointed questions that the opposition party drafts her as its candidate. Mrs. Morley, a powerful political force in her own right, still supports Finley while her son privately assists Holstrom. When the party decides to publicize false sexual allegations about Holstrom, Congressman Morley and Holstrom's three brothers track down Finley and his henchmen (it turns out that they are part of a neo-fascist organization) and force a retraction of the phony charges. On Election Day, both parties endorse Holstrom and she is elected to Congress.

THE GREAT MC GINTY

YEAR OF RELEASE 1940
DIRECTOR Preston Sturges
SETTING Unnamed Midwestern city
PLOT

An American bartender (Dan McGinty) in a Central American country tells his customers how he was once governor of a state. Through flashbacks, McGinty is seen as part of a soup line during the Depression. He is hired to cast multiple ballots on Election Day and his ambition and energy (he votes 37 times), brings him to the attention of someone known as The Boss, a political kingmaker. The Boss hires McGinty as a collector for his sundry extortion arrangements and again the new man excels. The Boss

has him elected alderman and then mayor. McGinty's meteoric rise is primarily based on his willingness to stand up to The Boss, apparently the only individual brave and reckless enough to do so. Along the way, The Boss suggests that his charge's political career requires him to present a more conventional and stable lifestyle and McGinty marries his secretary. Now governor of the state, McGinty seems prepared to institute some real reforms, mostly at the behest of his wife, when a scandal from his days as mayor lands him in jail. McGinty manages to escape, leaves a substantial amount of money in his wife's hands and flees to Central America where the movie ends.

THE LAST HURRAH

YEAR OF RELEASE 1958
DIRECTOR John Ford
SETTING Unnamed New England city
PLOT

Mayor Frank Skeffington incurs the wrath of the local elite when he announces his intentions to seek a fifth term in office. The Yankee establishment, bitterly resentful of the political emergence of the Irish-American bloc as symbolized by Skeffington, endorses his opponent, Kevin McCluskey. Earnest and hopelessly incompetent, McCluskey represents the new age of politics: he limits personal appearances and flesh-pressing for the sake of television commercials. Skeffington, who designates the campaign as his last hurrah, loses the election in a stunning upset, the reasons for which are never explained. On Election Day, the veteran politician suffers a major heart attack and dies shortly thereafter.

MR. SMITH GOES TO WASHINGTON

YEAR OF RELEASE 1939
DIRECTOR Frank Capra
SETTING Washington D.C.
PLOT

The sudden death of a U.S. Senator from an unnamed Western state leads the governor to appoint Jeff Smith, head of the state's Boy Rangers. The state's senior senator in Washington is Joseph Paine, backed by the machine of political boss Jim Taylor. Smith is expected to be little more than an honorary appointee, particularly since Paine has introduced a bill for construction of a federal dam in their state; the project figures to produce large profits for Taylor and his partners. The naive Smith, is to be assisted and watched by Clarissa Saunders, one of Paine's staffers who will work as Smith's secretary. Everything goes smoothly until Smith decides to introduce a bill of his own; coincidentally, it calls for the establishment of a boys' camp on the very site where Paine's dam is located. Saunders, gradually taken by the new senator's sincerity and good will, finally tells him about the dam. When Smith threatens to expose the shady transaction, Paine beats him to the punch by charging that the boys' camp idea was a hoax designed to enrich Smith. The pros-

pects of being expelled from the Senate on trumped up charges dishearten Smith to the point where he prepares to leave Washington. Saunders persuades him to stay by suggesting that a filibuster may allow Smith to mobilize public opinion against Taylor. Smith does get control of the Senate floor and holds it waiting for his constituents to express their support. Instead, because of a news blackout imposed by Taylor's powerful organization, the only messages that reach the Senate are against Smith. When all seems lost, Paine attempts to kill himself, fails and rushes into the Senate chamber confessing that Smith has been right all along.

POWER

YEAR OF RELEASE 1986
DIRECTOR Sidney Lumet
SETTING New York City and Washington D.C.
PLOT

Peter St. John is the head of a highly sophisticated New York firm which specializes in preparing the media component of political campaigns. Sam Hastings, a U.S. Senator from Ohio and close friend of St. John's, makes the surprising announcement that he will not seek reelection because of health problems. St. John is then hired by Jerome Cade, a wealthy businessman who wants to succeed Hastings. An independent candidate, college professor Phil Aarons, enters the Ohio race stressing environmental issues as his primary concern. St. John gradually realizes that foreign oil interests are behind Hastings' decision to retire. The Senator, who had been actively promoting a solar energy program, was forced to withdraw when he learned that his wife owed a large amount of money to an individual associated with Cade. Distressed at the connection and the tactics employed by Cade, St. John leaves the campaign, becoming an unofficial advisor to Aarons. Neither Cade nor Aarons wins the Ohio election (though the professor finishes a strong second); St. John's two other candidates (an incumbent governor in Washington and a Senatorial challenger in New Mexico) win and lose, respectively.

THE SEDUCTION OF JOE TYNAN

YEAR OF RELEASE 1979
DIRECTOR Jerry Schatzberg
SETTING Washington D.C.
PLOT

New York Senator Joe Tynan is approached by opponents of Supreme Court nominee Edward Anderson. Claiming that Anderson is a racist, civil rights groups urge Tynan to lead the fight in the Senate against Anderson. Members of Tynan's staff also see the confirmation of Anderson as a convenient opportunity for Tynan to gain national prominence, bolstering a future run for the White House. At the same time, Louisiana Senator Birney, a good friend of Tynan's, pleads with him not to get involved in the Anderson question. (Birney wants Anderson on the Supreme Court to avoid facing him in the state senatorial primary). Tynan's decision to

openly oppose the nomination is in part based on his sexual infatuation with one of the anti-Anderson attorneys. When Ellie Tynan discovers that her husband has been unfaithful, she is prepared to leave him. The Senator, who has succeeded in derailing the Anderson nomination, ends his extramarital affair and asks Ellie to stay with him. At the end of the film, just as Tynan is to address the Democratic national convention, his wife accepts a reconciliation.

SEVEN DAYS IN MAY

YEAR OF RELEASE 1964
DIRECTOR John Frankenheimer
SETTING Washington D.C.
PLOT

The Senate has ratified a controversial disarmament treaty with the Soviet Union. President Jordan Lyman is firmly behind the pact, but both the public and the military have serious misgivings about the Kremlin's good faith. In fact, the Chairman of the Joint Chiefs of Staff, General James Scott, is so fearful of the treaty's ramifications that he is planning to force the President out of office. General Scott's top aide accidentally learns of the coup and alerts the President. Lyman has no material evidence to prove that there is a conspiracy afoot so he has a cadre of a few trusted advisors investigate the situation. Finally, Lyman faces Scott in a one-on-one showdown in the Oval Office and tries to dissuade the general from following through on his design. Scott refuses and the President nearly confronts him with some incriminating love letters that the general has written to his mistress, but Lyman is too scrupulous to use them. Fortunately for the President, his press secretary (killed in a plane crash) had obtained a full confession from one of Scott's co-conspirators. At a climactic press conference, Lyman, alluding only to the lingering doubts about the treaty, asks for the resignations of the Joint Chiefs of Staff and they all comply.

STATE OF THE UNION

YEAR OF RELEASE 1948
DIRECTOR Frank Capra
SETTING New York State and Washington D.C.
PLOT

Newspaper publisher Kay Thorndyke convinces political handler Jim Conover to supervise the campaign of industrialist Grant Matthews for the 1948 Republican nomination. Matthews, a self-made millionaire with an instinctual dislike for traditional politics, is told that he must appear with his wife Mary in order to convey the desirable image of a family man. Mrs. Matthews knows that her husband has been having an affair with Thorndyke, but she agrees to help him in the campaign. Encouraged by Mary's reformist tendencies, Matthews' speeches are full of radical ideas with a populist twinge and they are well received by the public. Party leaders, however, stay away from Matthews until, as the result of appeals by Thorndyke and Conover, the candidate

tones down his rhetoric and appeals to key interest groups. Mary is dismayed by her husband's metamorphosis into an orthodox politician, but she again consents to play the supportive wife. When Matthews finally realizes that he has sold out his principles, he announces on a national television and radio broadcast that he will not be a candidate for the Republican nomination. Instead, he plans to appear at both conventions to ensure that no candidate compromises the interests of the American people for the sake of the party's narrow concerns.

TWILIGHT'S LAST GLEAMING

YEAR OF RELEASE	1977
DIRECTOR	Robert Aldrich
SETTING	Washington D.C. and Montana

PLOT

Air Force General Lawrence Dell, convicted of manslaughter after a bar fight, escapes from prison and, together with three other inmates, seizes control of a silo at a Montana missile base. Dell threatens to launch nine Titan missiles (pre-targeted to strike at the Soviet Union) unless President Daniel Stevens comes to Montana as a hostage. Dell also demands $10 million in cash, safe passage to another country and release of a secret document related to the Vietnam War. The President has never heard of such a document, but all his close advisors recommend against making it public. They fear that its contents (showing that the only reason for U.S. involvement in Vietnam was to impress upon the Soviet Union American determination to "inflict and suffer punishment") would be damaging to national security. President Stevens agrees to fly to Montana, but he also wants to release the document. When General Dell, another convict, and the President leave the missile base and walk toward Air Force One, snipers open fire and kill all three men. The Secretary of Defense, who had earlier promised Stevens that the documents would be released if anything happened to the President, now tells the dying chief executive that he will not keep his word.

ENDNOTES

---

1. The remark is attributed to Sam Briskin, "a hard-nosed studio executive." David Manning and Richard Averson, The Celluloid Weapon: Social Comment in the American Film (Beacon Press, 1972), p. x.

2. An example of the definitional problem can be found in Edward S. Greenberg and Benjamin I. Page, The Struggle for Democracy (HarperCollins, 1993). This introductory text deserves recognition for its unique attempt to discuss films as aids to the study of American politics. However, Greenberg and Page list any movie "which imparts important insights about the texture of our political, social and economic life" (p. A1) and end up with an imposing total of 110 entries, including such disparate films as "The Big Chill," "The Bonfire of the Vanities," "Boyz N the Hood," "Death of a Salesman," and "It Came From Outer Space." By way of contrast, another introductory text does not even consider films as part of the media ("Media here refers to the print and electronic means of disseminating information. These include television, radio, newspapers, magazines and books."). Robert S. Ross, American National Government: Institutions, Policy and Participation, 3rd ed. (Dushkin, 1993), p. 370.

I have excluded non-fiction films in order to focus on the political values of the production. A filmmaker shooting a non-fiction movie is restricted to the characterizations of real events. While directors' choices of subject matter [e.g., "Abe Lincoln in Illinois" (1940); "Wilson" (1944); "The Magnificent Yankee" (1950); "All the President's Men" (1976) or "JFK" (1991)] may betray their ideological tilt, the opportunities to interject value preferences will be more limited than in a work of fiction. In addition, audiences are more likely to bring with them preconceived notions about historical figures and incidents, further limiting the creative parameters of directors and writers.

3. The only significant production which I have omitted from this paper is Stanley Kubrick's "Dr. Strangelove: Or How I Learned to Stop Worrying and Love the Bomb." Its bizarre plot turns the movie into a farce rather than a satire. While satirical treatments are fertile ground for political analysis (four of the films I discuss are comedies), farces are designed to distort reality through hyperbole rather than to replicate it in a humorous fashion.

4. Space limitations preclude discussion of such central topics as the type of political decision-making which is featured in these movies; their treatment of women and minorities; the accuracy with which they describe the political process; and their treatment of such institutions as interest groups, the courts and the bureaucracy.

5. The 1991 confirmation of Judge Clarence Thomas had some of the same elements as Leffingwell's case. Perhaps Thomas, like Leffingwell, visited the White House after Professor Anita Hill had leveled her charges and was advised to return to the Senate hearing and deny everything.

6. In five other movies, office holders commit no criminal transgression, but they engage in activities inimical to the public interest. Thus, entrenched incumbents are not responsive to their constituents' needs in "The Candidate," (a U.S. Senator), "The Farmer's Daughter," (a U.S. Representative); "The Seduction of Joe Tynan" (another Senator) and "Power" (a third Senator).

Political leaders who are depicted favorably are usually treated as exceptional. In "Power," media expert Pete St. John admiringly tells Capitol Hill veteran Sam Hastings: "You're one of

the three or four guys who makes a difference up there [in the Senate]." A few days later, St. John discovers that Hastings has been deceiving him and hears the senator deny everything. "He was lying to me," St. John says. "For a politician, you'd think he would have been better." At first blush, "The Last Hurrah" may be mistaken as a paean to the career of Mayor Frank Skeffington, but the movie also shows him to lie repeatedly, to browbeat and blackmail his rivals and to take advantage of his office at every opportunity. Only the President in "Seven Days in May," a man struggling to uphold the constitution, and the Senator being opposed by the title character in "Bob Roberts," come across as mostly positive figures.

7. With the exception of Katrin Holstrom in "The Farmer's Daughter," all of the primary political figures in these films are males. Holstrom can hardly be hailed as a feminist role model. When one man (Congressman Glenn Morley) offers to marry her, she is eagerly agrees to abandon her incipient political career until another man (her father) tells her she should not. At film's end, she is being literally carried into the U.S. Capitol by her husband. There are major female protagonists in "First Monday in October" (1981) and "Kisses for My President" (1964), but neither film is suitable for this paper. "First Monday in October" focuses on the first woman nominated to the Supreme Court and offers very little political commentary. "Kisses For My President," a production of the Walt Disney Studios, begins with the election of the first woman to the White House and then uses that opportunity to spin off a long string of sexist jokes. The movie ends when the President becomes pregnant and, in a telling example of traditional gender distinction, resigns from office.

8. Refreshingly, "State of the Union" uses the names of real presidential contenders (incumbent Harry Truman, Thomas Dewey, Harold Stassen, Robert Taft) and "The Candidate" inserts footage of an actual Democratic Party gathering (featuring the likes of Hubert Humphrey, George McGovern, John Tunney, Jesse Unruh and Sam Yorty) "attended" by the fictitious Bill McKay. Apparently fearful of offending any segment of the audience, studios traditionally went to great lengths to avoid specific references to real parties or to states. The worst example of that practice is in "The Farmer's Daughter" with each party continually referring to the other only as the "opposition."

In a concession to realism, more films made in the last 30 years have dropped the aversion to geographical identification. Thus, real states were cited in "Advise and Consent" (1962); Senators represented actual states in "The Candidate" (1972), "The Seduction of Joe Tynan" (1979) and "Bob Roberts" (1992); and "The Distinguished Gentleman" (1992) hailed from Florida. Earlier movies forced viewers to guess where events were taking place: Given its similarities to Huey Long's career, "All the King's Men" (1949) seems to be set in Louisiana, but nobody says so (and no Southern accents are heard); "The Farmer's Daughter" (1947) could be in the Midwest given the abundance of snow and the presence of a sizable Swedish-American community; "Mr. Smith" (1939) represents an unnamed Western state; "The Last Hurrah" (1958) features the mayor of "a New England city" (with a few subtle references to what cognoscenti will spot as Boston); and "The Great McGinty" (1940) operates in a large urban center and a state with no name.

9. Stark would never have become a politician in the first place without the selfless support of wife Lucy who helped him finish his high school education and then worked with him to complete law school in the evenings.

10. Although he is not a politician, Peter St. John, the otherwise extraordinarily perceptive campaign expert of "Power," is also blinded to irregular behavior in the part of people he trusts. As discussed in note 6 supra, St. John has been a close friend of Senator Sam Hastings and is distraught when Hastings announces his withdrawal from politics due to ill health. Investigative reporter Ellen Freeman, formerly married to St. John, does not believe the story and St. John accuses her of being cynically suspicious. Eventually, the evidence shows that Hastings fabricated the story about the illness and that Freeman's efforts have helped St. John to follow the correct course of action.

11. Actually, the candidate in "The Distinguished Gentleman" does have to appeal to a third party. Rather than collecting the thousands of signatures needed to have his name placed on the ballot at the last minute, Thomas Johnson approaches the Silver Fox party, composed mostly of elderly citizens. Johnson charms his way onto the ballot, takes advantage of volunteers provided by the Silver Foxes to win the election and promptly forgets all about the party once he is in Washington.

12. The leading heroes in political films include such familiar faces as Henry Fonda, James Stewart, Spencer Tracy, Robert Redford, Alan Alda and Eddie Murphy. By contrasting that pantheon of celebrities with their respective adversaries (Cliff Robertson, Edward Arnold, Basil Rathbone, Don Porter, Melvyn Douglas and Lane Smith), it is clear that audiences would not require much time to determine where their allegiances should be placed.

13. Such gender discrimination went unnoticed in 1939. Current films are more politically correct: the child who manages to re-awaken some moral sensibilities in "The Distinguished Gentleman" is a girl and in his visit to the homeless shelter, President "Dave" reaches out to an African American boy.

14. The slashing of hundred of millions of dollars from the budget is accomplished through the suggestions of Kovic's friend Murray Blum. An accountant with a modest practice, Blum looks at the federal budget and promptly targets programs worth terminating. He also demystifies the complex budgetary process when he peruses a computer printout and exclaims: "Dave, I've been over this stuff a bunch of times and it just doesn't add up. Who does these books? If I ran my business this way, I'd be out of business!"

15. Van Ackerman's rationalization is echoed by General Scott when he tries to justify the unconstitutional removal of the President in "Seven Days in May." In both cases, the patriotic rhetoric employed is disturbingly similar to public statements made by and on behalf of Oliver North during the Iran-contra scandal. Bob Roberts' principal advisor also makes a comparable pitch when he testifies before Congress: "These hearings are another example of the depths to which the United States Congress is prepared to sink. This is a travesty! These allegations are erroneous at best. How

much more of this fiction does my family have to endure?" Since "Bob Roberts" was filmed years after North had testified, it can hardly be credited with the same prescience as the other two movies.

16. The first finding is from Michael Corbett, American Public Opinion (Longman, 1991), pp. 101-02 and the second from a Washington Post-ABC News Survey reported in "I'm OK; My Government's Not," The Washington Post National Weekly, July 26-August 1, 1993; p. 37.

17. In Why Americans Hate Politics, E.J. Dionne Jr. attributes the voters' despondency to the failure of liberal and conservative politicians to generate new ideas. Given the notoriously low levels of political awareness in this country, Dionne's argument seems to impute too much knowledge to the populace.

18. If Perot with his flip charts can show everyone how simple it would be to balance the budget, it should not be surprising that audiences howl in delight when they see a movie ("Dave") in which a complete novice can move into the Oval Office and get things done with amazing alacrity.

19. With his attacks on Washington insiders, Perot further reinforces the suggestion that the failures of the American political system are the result of incompetent public officials. See Michael Lewis' review of Perot's Not For Sale At Any Price, (Hyperon, 1993) in The New York Times Book Review, August 1, 1993, pp. 13-14.

20. Michael Parenti argues that movies and television, in manufacturing propaganda for the status quo, "... have propagated images and ideologies that are supportive of imperialism, phobic anticommunism, capitalism, racism, sexism, militarism, authoritarian violence, vigilantism, and anti-working class attitudes." Michael Parenti, Make-Believe Media: The Politics of Entertainment (St. Martin's, 1992), p. 2. Except for a one-paragraph summary of "Mr. Smith Goes to Washington", Parenti's book does not refer to any of the films discussed in this paper.

21. Mary E. Stuckey, The President as Interpreter-In-Chief (Chatham House, 1991), pp. 138-39.

22. The classical example of this pattern is gun control legislation. Polls consistently show a large majority of Americans in favor of the federal regulation of firearms, but when such proposals reach Congress, the strongest expressions of opinion come from the minority which opposes the bils. Then the absence of gun control legislation is presented to the public as an illustration of the insidious influence of special interest groups.

23. As has happened in the real case of White House official Vincent Foster Jr., the lack of a suicide note shrouds Anderson's death in mystery. Both Foster and Anderson showed signs of stress and frustration in the last days of their lives, but apparently did not share their suicidal intentions with anyone.

24. The harmful consequences of these kinds of disclosures still seem relevant to candidates' political fortunes. The Russell story anticipates by eight years the fate of Senator Thomas Eagleton who was dropped as the Democratic Vice-Presidential nominee in 1972 after he acknowledged having undergone psychiatry care. Although there are no known instances of gossip about the sexual orientation of a national candidate, it is doubtful that the electorate is prepared to accept a gay or lesbian nominee.

THE ECONOMIC THEORY OF ALLIANCES: A SURVEY

Subtitle: Theory of Alliances

AUTHOR'S NOTE: The author has profited greatly from comments provided by John Oneal and an anonymous referee on an earlier draft. The research for this study was funded by the National Science Foundation (NSF) grant no. SBR-9222953. Sole responsibility for any remaining errors and for the opinions expressed in the paper rests with the author.

THE ECONOMIC THEORY OF ALLIANCES: A SURVEY

This paper surveys the development of the economic theory of alliances over the last quarter of a century since the seminal paper by Olson and Zeckhauser (1966). The pure public good model and the joint product model are presented and then brought up to date. Alternative demand functions for military expenditures are indicated. Issues that concern alliance size, burden sharing, and suboptimality are addressed for the alternative paradigms. Theoretical extensions are reviewed and have involved the technology of public supply, the security function, alternative cost structures, group allocation processes, and institutional arrangements. Finally, theoretical developments are briefly related to the large empirical literature.

THE ECONOMIC THEORY OF ALLIANCES: A SURVEY

In a seminal article, Olson and Zeckhauser (1966) developed an economic theory of alliances by characterizing deterrence as a pure public good. To qualify as a pure public good, deterrence must satisfy two requirements: benefits must be nonexcludable and nonrival among allies. If defense is purely public among allies, then a number of hypotheses can be derived. First, defense burdens are expected to be shared unevenly among allies: large, wealthy allies will shoulder the defense burdens for smaller, poorer allies. Second, defense expenditures are predicted to be at inefficient or suboptimal levels in relation to a Pareto-optimal standard. Third, there is no need to restrict alliance size, since the addition of an ally implies positive net marginal benefits as costs are shared among a larger number of allies, but benefits are not diminished for existing allies. Fourth, an ally's demand for defense depends on relative prices, the ally's income, the level of its allies' defense expenditures, and the perceived threat.

Olson and Zeckhauser examined the first hypothesis for the North Atlantic Treaty Organization (NATO) in 1964 and found a significant positive correlation between an ally's gross national product (GNP) and its ratio of military expenditures (ME) to GNP. Thus, the wealthier allies assumed a greater defense burden, as measured by ME/GNP, than poorer allies. Free riding accusations were leveled at these poorer allies. The Olson and Zeckhauser paper is important not only for its insights on military alliances, but also for its methodology that can be applied to the study of any supranational structure that shares public goods.

During the late 1960s and 1970s, the burden sharing hypothesis of Olson and Zeckhauser no longer seemed to apply to NATO. This was first identified by Russett (1970) and later analyzed by Beer (1972), Sandler and Cauley

(1975), Sandler and Forbes (1980), Sandler (1988), Oneal (1990b), and Palmer (1990b). Something had changed in the motivation of the allies to assume defense burdens. Smaller allies were assuming a greater portion of the defense burdens. To find an answer to this change, researchers generalized the pure public good model so that military expenditures can provide multiple benefits--deterrence, damage-limiting protection in wartime, and the pursuit of nation-specific interests--that vary in their degree of publicness among allies. Joint products are present. The resulting joint product model implies profoundly different hypotheses when private and/or impure public benefits accompanied the output of deterrence. First, burdens of defense are predicted to be shared more in accordance with the benefits received. The presence of ally-specific private benefits and alliancewide excludable benefits motivates allies to share defense burdens based on considerations that do not solely depend on economic size. Small allies that receive substantial excludable benefits may assume a large burden despite their wealth position (see, e.g., Oneal 1990a, 1990b; Oneal and Elrod 1989). Second, defense levels may be nearer to Pareto-optimal ideals when joint products are present. Third, alliance membership restrictions, based on rivalry of benefits received, become relevant. Fourth, an ally's demand for defense may depend on factors not germane to the pure public good paradigm.

The purpose of this paper is to survey the development of the economic theory of alliances over the last quarter of a century. Although the focus here is on theoretical studies, some empirical applications are reviewed. The economic theory of alliances is important for a number of reasons. First, the theory has policy implications for burden sharing and alliance composition. Second, the theory has been used to derive systems of demand equations that can be used for empirical tests (McGuire and Groth 1985;

McGuire 1990; Murdoch and Sandler 1984; Murdoch, Sandler, and Hansen 1991; Sandler and Murdoch 1990; Okamura 1991). Third, these demand equation systems can be used for forecasting purposes. Fourth, the methods used in the economic theory of alliances can be fruitfully applied to the study of other supranational structures, such as environmental pacts, the United Nations, the World Health Organization, and common markets.

Despite the end to the Cold War, the study of alliances is still of current interest. The Gulf War in 1991 demonstrates that allied efforts may be needed to protect strategic resource interests and to stem aggression. Events in the former Yugoslavian republics also might require allied efforts to curb the spread of the conflict. As nations downsize their military forces, alliances afford countries the opportunity to pool forces to meet contingencies.

PURE PUBLIC GOOD MODEL

If defense is a pure public good for the allies, then defense benefits must be nonrival and nonexcludable among allies. The benefits of defense are nonrival or indivisible among allies when a unit of defense can be consumed by one ally without detracting, in the slightest, from the consumption opportunities still available to other allies from that same unit. Deterrence, as provided by a nuclear triad, is nonrival among allies because, once the triad is deployed, its ability to deter enemy aggression is independent of the number of allies, provided that the retaliatory response is automatic. The strategic capabilities and credibility of the response determine its ability to deter aggression. If, however, the credibility of a retaliatory pledge depends on the number of allies on whose behalf that it is made, then nonrivalry may occur as group size expands.

Goods whose benefits can be withheld costlessly by the provider are excludable. Benefits that are available to all once the good is provided are nonexcludable. For the nuclear triad, its benefits are nonexcludable if the defense provider cannot withhold the promised retaliatory response against an invader of another ally. If an enemy invasion causes collateral damage to the provider of the deterrent weapons, then the retaliatory response is likely to be executed. In the case of Canada, a nuclear attack would cause widespread damage and death from fallout in the United States; hence, a U.S. retaliation is anticipated. Canada cannot be excluded from the nuclear deterrence of the United States. The stationing of troops of one ally on other allies' soil ensures collateral damages from an attack and increases the likelihood of alliancewide retaliation against an invasion anywhere within the alliance. The flow of capital and business people among allies collectivizes the security of the allies, thereby increasing nonexcludability of defense benefits.

PURE PUBLIC GOOD MODEL OF ALLIANCES: MATHEMATICAL REPRESENTATION

In the simplest representation, each of n allies is assumed to allocate national income, I, between a nondefense, private numéraire good, y, and a pure public defense good, q. The decision maker is assumed to be some unspecified agent i whose utility,

$$U^i = U^i(y^i, Q, T), \qquad [1]$$

is representative of the nation's population. In equation 1, Q is the sum of all allies' defense allocations,

$$Q = \sum_{i=1}^{n} q^i \qquad [2]$$

in which superscripts denote the ally. Moreover, T is some threat measure and may be represented by enemy collective or aggregate military expenditures.

The use of an unspecified single agent's utility function to represent the tastes for an entire nation is an abstraction that is employed in many studies of international relations. This abstraction can be relaxed to include other decision makers such as the median voter (Dudley and Montmarquette 1981; Murdoch, Sandler, and Hansen 1991). If the decision maker's identity is altered, then the resource constraint must change accordingly. If, for example, the central government is the decision maker, then government revenues, not national income, would be the relevant income variable in the resource constraint. As a consequence, the demand for defense is apt to include different exogenous variables depending on who is the decision maker. The pure public good model presented here is most in keeping with the standard treatment in the literature (see, e.g., Olson and Zeckhauser 1966; Smith 1980; van Ypersele de Strihou 1967).

The notion of pure publicness is embodied in equation 2, in which alliancewide defense is the simple sum of the allies' defense activities. This technology of public supply aggregation implies perfect substitutability of defense among allies, because a unit more (less) of defense in any of the allies equally enhances (detracts from) alliancewide defense. Perfect substitutability is, in large part, behind the free-rider problem, whereby an ally relies on the defense provision of others to underwrite its own security.

The resource constraint of an ally is

$$I^i = y^i + pq^i, \qquad [3]$$

in which the per-unit price of y is set equal to 1 and the per-unit price of q^i is p. For each ally, a Nash equilibrium allocation is found by maximizing utility in equation 1 subject to equation 3 and to the best-response level for defense in the other allies. The aggregate defense level in allies other than the ith ally, $\tilde{Q}^i$, equals

$$\tilde{Q}^i = \sum_{j \neq i} q^j, \qquad [4]$$

and is called a spillin to ally i. A best-response level of spillins, $\tilde{Q}^{i*}$, is attained when each ally optimizes with respect to its choices for defense, given the choices of the other allies; thus, no ally would want to adjust its allocative choices for y^i and q^i at a best-response level.

The Nash problem for ally i is to solve the following problem:[1]

$$\max_{y^i, q^i} \{U^i(y^i, q^i + \tilde{Q}^{i*}, T) \mid I^i = y^i + pq^i\}. \qquad [5]$$

A Nash equilibrium consists of allocations (y^i, q^i) for each ally in which equation 5 is satisfied. This requires y^is and q^is that satisfy the budget constraint and the following first-order conditions (FOCs),

$$MRS^i_{Qy} = p, \qquad [6]$$

for every ally i. In equation 6, MRS^i_{Qy} denotes the ith ally's marginal rate of substitution (MRS) between defense and the private good. As such, it depicts the ratio of the marginal utilities of good Q to that of good y and, hence, indicates the ally's per-unit marginal valuation of defense in terms of the numéraire.

Suboptimality for the pure public good paradigm is established by contrasting the Nash equilibrium level of defense, Q^N, which represents the noncooperative solution, to the Pareto-optimal cooperative solution, Q^P. For the former equilibrium, the ally's decision maker is only concerned with the social welfare of his/her citizens, so that benefits conferred on others, who are within the alliance but outside of the decision maker's borders, are ignored. The Pareto optimum would occur if the allies vested a central supranational authority with the power to choose a level of alliancewide defense that maximizes social welfare for the entire alliance. The Pareto-optimal alliancewide defense level is derived by maximizing the ith ally's

utility subject to the constancy of the other allies' utility level and to the alliancewide resource constraint. The resulting FOCs can be expressed as

$$\sum_{i=1}^{n} MRS^{i}_{Qy} = p, \qquad [7]$$

or the sum of MRSs equals the per-unit price of defense.

Since the sharing of purely public defense among allies is representative of a collective action problem, other allocative concerns can be raised by appealing to the literature on collective action (Olson 1965; Russett and Sullivan 1971; Sandler 1992). As the number of allies increases, the extent of suboptimality is expected to worsen. Thus, small alliances (e.g., the Triple Entente prior to World War I) are apt, _ceteris paribus_, to have fewer suboptimality problems with respect to defense levels as compared with large alliances (e.g., a sixteen-nation alliance such as NATO).

A second collective action problem is the so-called _exploitation hypothesis_, whereby the large, wealthy allies shoulder the defense burdens of the smaller allies (Olson and Zeckhauser 1966). With the pure public good model, defense provision of a large, wealthy ally is a perfect substitute for the smaller allies' defense. When an ally's demand for defense is positively related to national income so that defense is a normal good, wealthier allies can be expected to contribute more defense than less wealthy allies, provided that tastes do not differ significantly among allies. The positive relationship between income and defense arises, in part, because wealth may bring forth a greater threat of invasion while providing the nation the means to protect itself.[2] Almost all studies of defense demand found defense to be a normal good (Murdoch and Sandler 1984). Free or easy riding is often related to the income elasticity of defense, because a positive income elasticity of defense demand is associated with a negatively sloped reaction path, where an ally decreases its defense as spillins from allies increase.

In some cases, free riding may result if there is little need for poorer allies to provide military expenditures in excess of spillins. Consequently, unequal burden sharing, based on national income levels is expected. Olson and Zeckhauser (1966) hypothesized a positive relationship between GNP and defense burdens as measured by ME/GNP. Their hypothesis was borne out for NATO during 1964. Subsequent studies found a positive, but declining, relationship for NATO (Russett 1970; Pryor 1968; Sandler and Forbes 1980; Oneal 1990b). Comparable analyses have been done for the Warsaw Pact (Russett 1970; Starr 1974; Reisinger, 1983).

A third collective action prediction concerns the impact of endowment asymmetry among potential members on the likelihood of group formation. Unequal endowments are conducive to formation, because it is then more likely that at least one potential participant (ally) will get sufficient net benefits from providing the public good even if the agent must bear the entire cost (Sandler 1992).

At this juncture, the simplifying assumptions that underlie the standard pure public good model are highlighted. Relaxation of these assumptions are behind the extensions of the theory presented in the fourth section. First, the resource constraint assumes constant marginal cost of defense provision both within and among allies, because p is a constant. This marginal cost is also identical among allies so that no ally has a comparative advantage in producing defense. Second, the threat variable is introduced as an exogenous variable. The interaction between adversaries, as in an arms race, is not considered explicitly as part of the model. Third, the analysis is a static equilibrium formulation. Fourth, Nash behavior is assumed so that strategic interactions that allow one ally to anticipate the reactions of the other allies are not permitted. Fifth, allied defense levels are aggregated with

the use of an unweighted summation technology in equation 2.

DEMAND AND REACTION FUNCTIONS

We now return to the basic maximization problem of equation 5. This maximization problem yields three first-order conditions (FOCs) that, in principle, can be used to solve for the demands for the private good and the defense good in terms of the exogenous variables:[3]

$$y^i = y^i(I^i, p, \tilde{Q}, T), \qquad [8]$$

$$q^i = q^i(I^i, p, \tilde{Q}, T). \qquad [9]$$

In equation 9, the demand for defense expenditures in ally i depends on its national income (e.g., gross domestic product), the relative price of defense goods, the level of spillins, and the threat level. Most pure public good studies of allied defense demands[4] are based on equations of this form.

When defense is expressed as a function of spillins and other exogenous variables, the associated demand equation is also called a reaction function. If all prices are normalized to 1 and if, furthermore, threat is left out, then the resulting reaction function could have the linearized form:

$$q^i = K - \gamma^i \tilde{Q}, \qquad i = 1,\ldots,n, \qquad [10]$$

in which K is the isolated purchases of the defense good (if spillins are zero) and $(1 - \gamma^i)$ is the ally's marginal propensity to spend income on defense (McGuire 1974). Since γ^i is positive, the reaction function is negatively sloped. Another way of characterizing a Nash equilibrium is to define it as the mutual satisfaction of the allies' reaction functions.

Linear reaction functions can be generated by assuming a Stone-Geary utility function,

$$U^i = (Q - \beta T)^{\alpha}(y^i - \theta^i)^{1-\alpha} \qquad [11]$$

for each ally, in which βT is the minimal or subsistence public good level of defense (based upon threat), θ^i is the subsistence requirement for private good consumption, and α is a positive exponent whose value is less than 1. The parameters β and α could be individualized by introducing an i index. By finding the FOCs associated with optimizing equation 11, constrained by resources, we can derive the following reaction or expenditure function:

$$pq^i = \alpha(I^i - \theta^i) - (1 - \alpha)p\tilde{Q}^i + (1 - \alpha)\beta pT. \qquad [12]$$

Because $\alpha < 1$, the reaction function is negatively sloped in terms of spillins, $\tilde{Q}$. The linear expenditure system analysis of alliance demand has been developed in a series of important articles by Dudley and Montmarquette (1981), McGuire (1982, 1990), McGuire and Groth (1985), Hilton and Vu (1991), and Okamura (1991).

A final implication of pure publicness concerns the neutrality theorem, which indicates that the Nash equilibrium provision level for any pure public good is invariant to income redistribution among an unchanged set of contributors (Warr 1983; Sandler 1992, ch. 3; Sandler and Murdoch 1990; Bruce 1990). This theorem only holds for interior solutions in which all allies provide some defense both before and after the income redistribution, which may come about because of taxes. This surprising result hinges on the assumptions highlighted at the end of the last section. If, for example, Nash behavior is absent, or if marginal cost differs by allies, neutrality is no longer assured.

GRAPHIC REPRESENTATION: TWO-ALLY CASE

We utilize a graphical procedure developed by Cornes and Sandler (1984, 1986) to illustrate the two-ally allocation problem. With some further assumptions, the procedure can be extended to examine an n-nation alliance.

Only two allies are studied, in which each ally faces the following problem,

$$\max_{y^i, q^i} \{U^i(y^i, q^i + q^j, T) \mid I^i = y^i + pq^i\}, \qquad [13]$$

where q^j is the level of spillins for ally i. Henceforth, ally i is ally 1, and ally j is ally 2. By substituting the budget constraint for y^1, ally 1's constrained utility is

$$U^1 = U^1(I^1 - pq^1, q^1 + q^2, T)$$

$$= U^1(q^1, q^2; I^1, p, T). \qquad [14]$$

According to equation 14, budget-contrained utility can be displayed in (q^1, q^2) space for given income, threat, and public good price.

In Figure 1, three budget-constrained iso-utility curves are displayed. Higher values of spillins clearly imply, ceteris paribus, more preferred allocations so that v^2v^2 is a higher level of utility than curve v^1v^1. The weakly preferred sets are indicated in the figure by the cross-hatched areas on and above the iso-utility curves. The vertical line I^1/p indicates the set of allocations that would exhaust ally 1's income.

The slope of the iso-utility curves is

$$\left.\frac{dq^2}{dq^1}\right|_{U^1=\bar{U}^1} = -\frac{\partial U^1/\partial q^1}{\partial U^1/\partial q^2} = -1 + \frac{p}{MRS^1_{Qy}}. \qquad [15]$$

When this slope is zero, the FOC for a Nash equilibrium, as in equation 6, is satisfied. In Figure 1, at any level of spillins, say $\bar{q}^2$, the Nash condition is satisfied where the horizontal line $\bar{q}^2\bar{q}^2$ is tangent to the iso-utility curve at point e. This point of tangency represents the ally's optimal choice for defense, given the prevailing level of spillins.[5] By varying the levels of spillins and locating the locus of tangencies, we generate the Nash reaction path, NN, for ally 1.

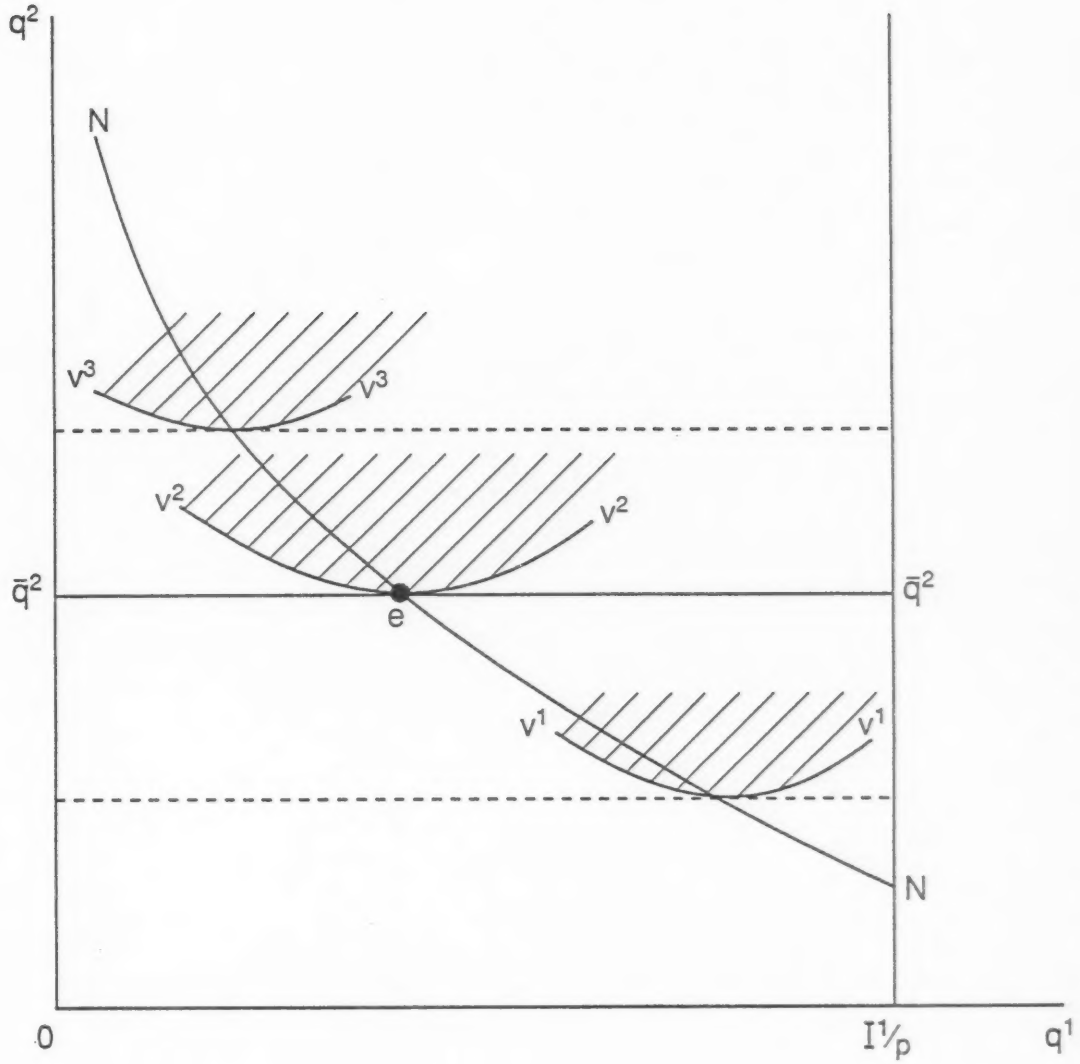

Figure 1: Iso-Utility Curves

The two-ally Nash equilibrium is depicted in Figure 2, where two of ally 2's iso-utility curves ii and i^1i^1 are displayed along with two of ally 1's iso-utility curves II and I^1I^1. The analysis of ally 2 is analogous to that of ally 1, except that q^1 now denotes spillins and q^2 depicts the ally's defense contribution. In consequence, ally 2's iso-utility curves are translated through 90° so that its iso-utility curves are oriented with respect to the q^2 axis and has a slope equal to the reciprocal of $(-1 + p/MRS^2_{Qy})$. Tangencies between the iso-utility curves and a vertical line, corresponding to a fixed level of q^1, define points on the Nash reaction path, N^2N^2, for ally 2. At the intersection of the two reaction paths, point N, both allies' Nash conditions are mutually satisfied; neither ally would want to alter unilaterally its allocative decision.

It can be shown that if all goods are normal with positive income elasticities, then the slope of ally 1's reaction path is negative with a value less than −1 (Cornes and Sandler 1986, 75). Similarly, the slope of the reaction path for ally 2 is greater than −1 in value owing to the 90° translation. Under these circumstances not only is the Nash equilibrium at N stable, but it is also unique. To show the total amount of the public good associated with the Nash equilibrium, we draw line AA with a slope of −1 through point N so that this line makes a 45° angle with the two axes at their intercept. Distance OA along either axis then measures the total contribution to alliancewide defense.

The suboptimality of the Nash equilibrium is easily shown in Figure 2. Points in the cross-hatched region bounded by the allies' iso-utility curves II and ii are Pareto superior to N since the utility levels of both allies are greater--i.e., the iso-utility curves through a point, such as Q, are higher for both allies. The Pareto path corresponds to the dotted curve where the

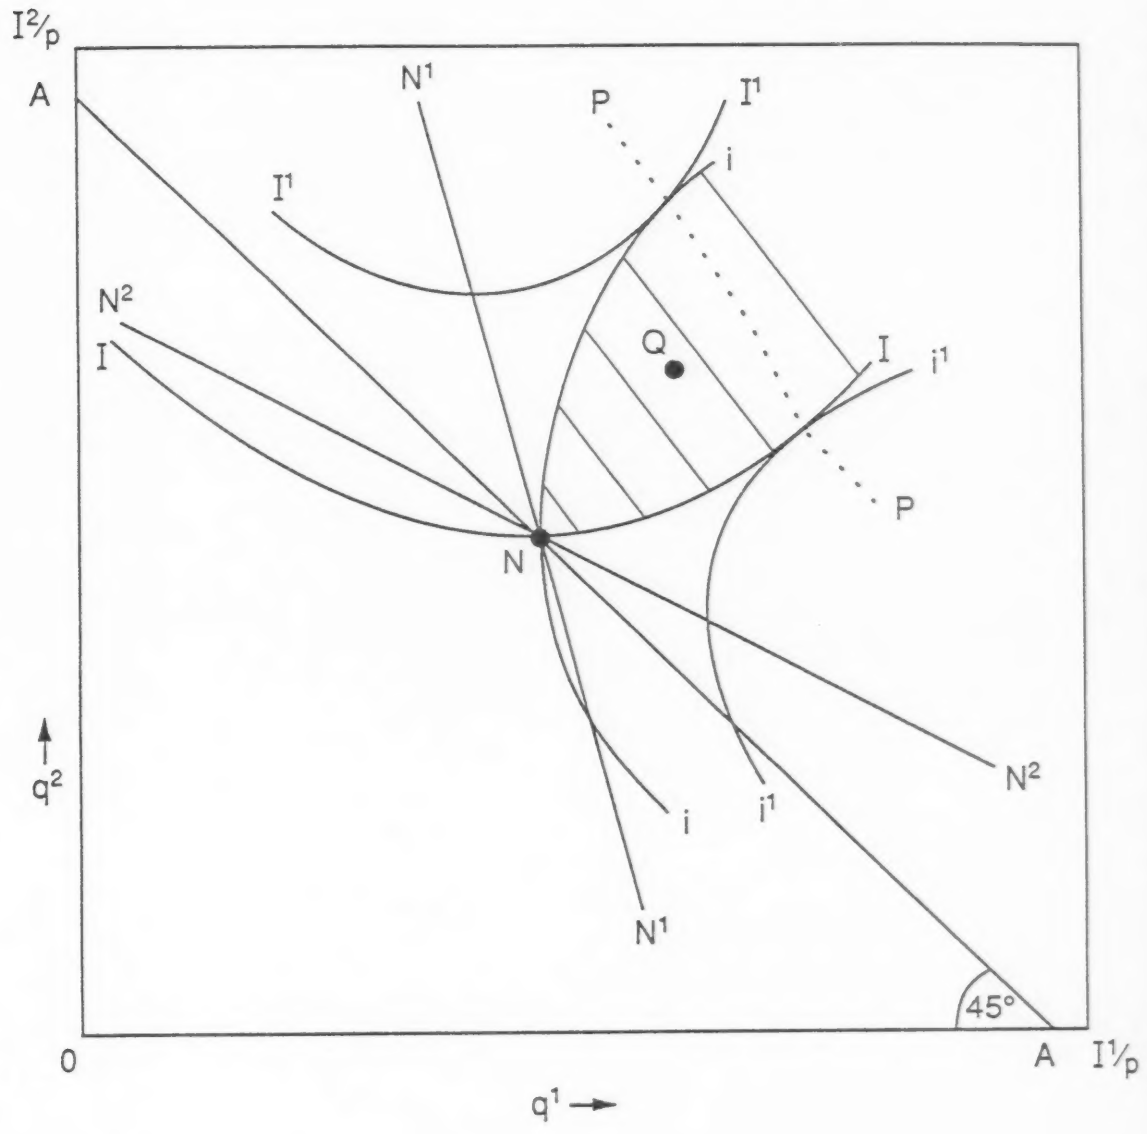

Figure 2: Two-Ally Nash Equilibrium

allies' iso-utility curves are tangent. Along this path, the Pareto-optimality condition $\Sigma MRS^{i}_{Qy} = p$ is satisfied.

The diagram is capable of extension in a number of directions. For example, a nonlinear resource constraint can be used, provided that the constraint defines a convex feasible region. The slope of the resource-constrained iso-utility curve would be of the same form as equation 15, except for the replacement of p by the ratio of marginal costs. For identical allies, the diagram can be extended to N allies.

In Figure 3, we represent the so-called exploitation hypothesis where ally 1 (the well-endowed nation) provides most of alliancewide defense as compared with the efforts of ally 2 (the less well-endowed ally). The income endowment of the ally determines the relative positions of the Nash reaction paths; ceteris paribus, smaller income levels mean that the ally will provide a smaller level of q in response to each level of spillins if defense is a normal good. The small endowment of ally 2 implies a small feasible level of q^2 as indicated by line I^2/p. The Nash equilibrium at N has ally 1 providing q^{1*} and ally 2 providing q^{2*}. If the income of ally 1 were to increase, the Nash path N^1N^1 would shift out and a corner solution with ally 2 providing no defense is a distinct possibility. This demonstration depends on the absence of ally-specific defense benefits.

Note further that a drop in the defense price faced by either ally would increase that ally's feasible set and shift out the Nash reaction path much the same as an income increase. Feasible sets can differ due to comparative advantage if one ally is a cheaper producer of the defense good (Boyer 1989, 1990; Wong 1991). If relative cost advantages were independent of the sizes of the allies, then the exploitation hypothesis need not hold.

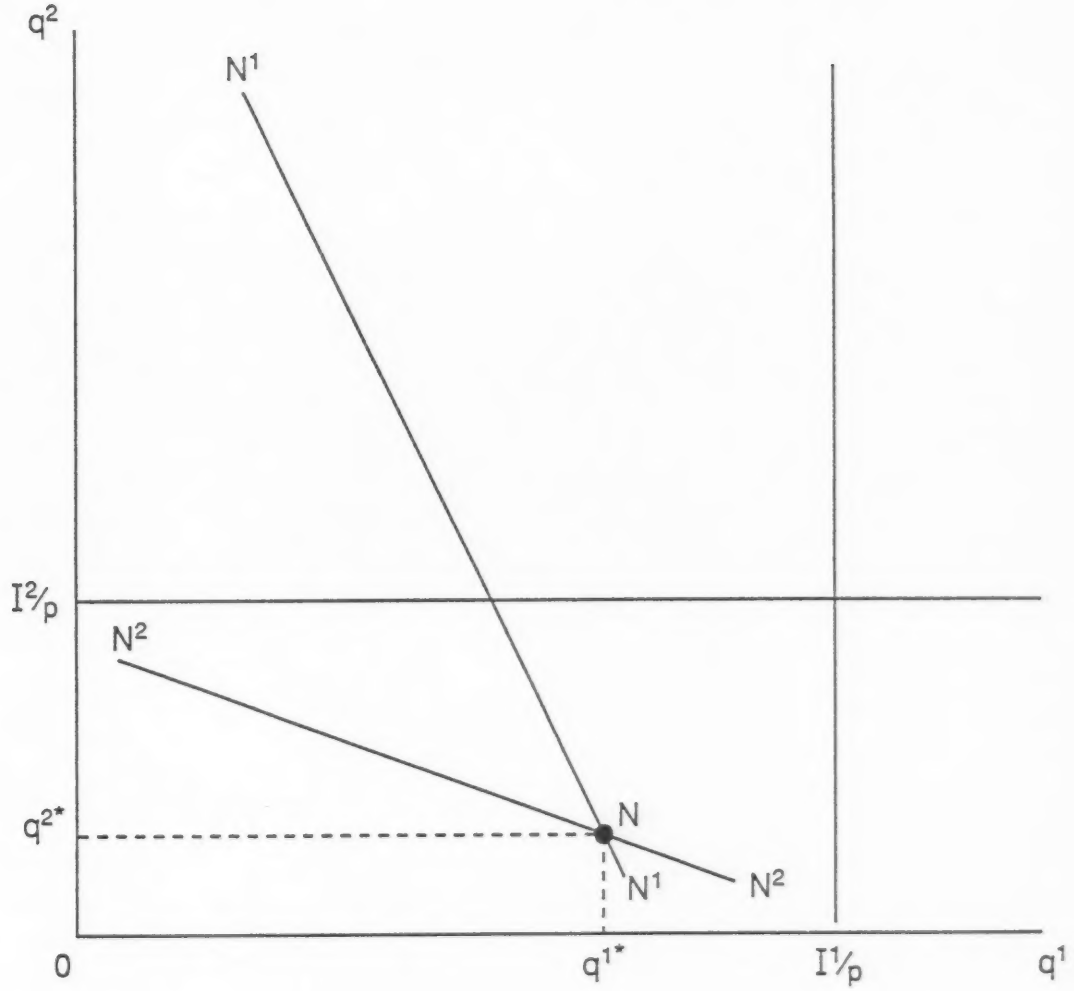

Figure 3: Exploitation Hypothesis

THE JOINT PRODUCT MODEL

Jacques van Ypersele de Strihou (1967) pointed to defense benefits that are private among allies. For instance, an ally might build up its arsenal to maintain control over colonies. This control provides purely public benefits to the nation's population, but does not spill over to the nation's ally. Even if two allies have colonial interests, the stationing of troops in the colony of one ally does not afford protection to the colonial interests of another. Benefits derived from colonial protection are excludable and rival among allies and, hence, are private between two allies. Other examples of inter-alliance private benefits include disaster relief, drug interdiction, protection of coastal resources, maintenance of domestic order, and crisis management during terrorist incidents. Van Ypersele de Strihou (1967) indicated that defense burden sharing in an alliance is more apt to be associated with benefits received when private benefits are a significant proportion of defense benefits received by allies.

The joint product model goes a step further than van Ypersele de Strihou's extension by allowing the defense activity to produce a variety of outputs that may be purely public, purely private, or impurely public among allies.[6] In particular, an alliance arsenal fulfills at least three general functions: (1) deterrence, (2) damage limitation or protection, and (3) private or national-specific goals (Knorr 1985; Russett 1970). Defense outputs are impurely public among allies when defense benefits are either partially rival among allies or else partially excludable by the providing nation. Partial rivalry occurs when the benefits available to other users of a good decline as the number of users or the extent of utilization increases. Conventional forces and arsenals yield both deterrence and damage-limiting protection, needed when deterrence fails and conflict begins. Although the

deterrence benefits may be purely public, damage-limiting protection is subject to consumption rivalry in the form of force thinning as a given amount of conventional weapons is spread to defend a longer perimeter or a greater surface area. In other words, the deployment of conventional forces to limit damage does not afford equal protection to all allies. Moreover, increasing the concentration of troops along one ally's borders may increase the vulnerability of another ally's borders owing to rivalry. Since deployment decisions can exclude one or more allies, conventional armaments possess partially excludable benefits.

In general, defense activities may give forth a vector of outputs to the allies. Conventional armaments yield country-specific private benefits and impurely public damage limitation. Since the strength of the arsenal may deter aggression, some purely public benefits are also present. However, the relative share of private and impurely public benefits are expected to be greater with conventional armaments than with strategic nuclear weapons. The latter are not subject to thinning or spatial rivalry, provided that allies confront a common enemy.

Many factors can contribute to the mix of public and private outputs derived from military activities. First, the strategic doctrine can help determine this mix. A doctrine of flexible response, as adopted by NATO in the late 1960s, permits NATO to respond in different ways to a Warsaw Pact challenge; conventional forces or strategic forces may be used and, in the latter case, a missile exchange may be limited or complete. By allowing for a measured response in relationship to the perceived threat, this doctrine increased the importance of conventional forces as compared with the earlier doctrine of Mutual Assured Destruction (MAD) deterrence, which relied on strategic nuclear weapons.[7] As conventional forces increase in importance, so

do excludable benefits. Second, changes in military technology can alter the mix of private and public benefits. For example, the development of precision-guided munitions (smart bombs) allow some weapons, such as cruise missiles, to be used in conventional and strategic roles. Third, diplomacy can also alter the mix of benefits and costs derived from defense activities.

MATHEMATICAL REPRESENTATION

We now consider a representative ally that allocates its scarce resources between a military activity, q, and a private (nondefense) consumption activity, y. A unit of the private nondefense activity is identical by assumption to a unit of the private good; however, a unit of the military activity is assumed to yield both a private and a public defense output. The model can be easily extended to allow for private, impure public, and pure public benefits. Let x stand for the private defense output and z for the pure public defense output. The joint product relationships are[8]

$$x^i = f(q^i), \qquad [16]$$

$$z^i = g(q^i), \qquad [17]$$

where both $f(q^i)$ and $g(q^i)$ are increasing, strictly concave, and twice-continuously differentiable functions. For equations 16-17, the derivatives (f' and g') measure the respective marginal productivities of the military activity in providing defense outputs. The amount of alliancewide public benefit spillins, $\tilde{Z}$, provided by the other allies is a function of the aggregate military activity, $\tilde{Q}$, in the allies so that

$$\tilde{Z}^i = h(\tilde{Q}^i), \qquad [18]$$

where $h' > 0$ and $h'' < 0$. The total level of pure public defense benefits is

$$Z = z^i + \tilde{Z}^i. \qquad [19]$$

To simplify the analysis, we allow for fixed proportions so that

$$x^i = \sigma q^i, \qquad [16a]$$

$$z^i = \delta q^i, \qquad [17a]$$

$$\bar{Z}^i = \delta \bar{Q}^i, \qquad [18a]$$

in equations 16, 17 and 18, respectively. The representative ally's utility function is

$$U^i = U^i(y^i, x^i, Z, T), \qquad [20]$$

which by equations 16a-18a and 19 is

$$U^i = U^i(y^i, \sigma q^i, \delta(q^i + \bar{Q}^i), T) \qquad [21]$$

in activity space. A Nash equilibrium corresponds to maximizing utility in equation 21 subject to the resource constraint,

$$I^i = y^i + pq^i, \qquad [22]$$

and to $\bar{Q}$ being set at the best-response level for the other allies.

A Nash equilibrium is consequently attained when the following FOCs are simultaneously satisfied:

$$\sigma MRS^i_{xy} + \delta MRS^i_{Zy} = p, \qquad i = 1,\ldots,n, \qquad [23]$$

where MRS_{xy} is the marginal rate of substitution of private defense output x for good y. A similar interpretation holds for MRS_{Zy}. The left-hand side of equation 23 is the marginal benefit derived by an ally from a unit of the general defense activity. Since each unit of q yields varying amounts of the private and public defense output, the marginal value of each must be accounted for and weighted by the respective marginal productivities, i.e., σ and δ. The right-hand side of equation 23 is the marginal cost of q.

The Nash equilibrium is still suboptimal, because the alliancewide marginal benefits that an ally's defense conveys to other allies; that is, $\sum_{j \neq i} \delta MRS^j_{Zy}$ is unaccounted. Surprisingly, the same graphic device as displayed

in Figures 1-2 can be used, with some reinterpretation to illustrate the Nash equilibrium for two allies in the presence of joint products. The slope of the iso-utility curve is now

$$\left.\frac{dq^2}{dq^1}\right|_{\bar{U}^1} = \frac{p - MRS^1_{qy}}{\delta MRS^1_{Zy}} \qquad [24]$$

in which MRS^1_{qy} is the weighted sum on the left-hand side of equation 23. Insofar as the simultaneous satisfaction of the budget constraint, the joint product relations, and the set of allocations weakly preferred to any reference allocation consists of the intersection of convex sets, the iso-utility curves are still shaped like those in Figure 1.

The primary difference in the graph concerns the shape of the Nash reaction path, which can have a positive slope when the joint products are complementary in the Hicksian sense (i.e., $\partial MRS_{xy}/\partial Z > 0$). This inequality means that the marginal valuation or marginal benefit of good x is larger when there is more of good Z available so that the jointly produced outputs are best consumed together. As benefits derived from good Z spill in from the defense activity of its allies, a nation will want to consume more of the complement, good x, and this is only possible if the nation increases its own defense activity level. Hence, an increase in spillins no longer necessarily implies that an ally will decrease its own defense activities, provided that complementarity of joint products are sufficiently strong.[9] If a military doctrine can create a complementarity between the excludable and nonexcludable joint outputs derived from military activities, then allies may increase their own efforts in relation to those of another ally.

The joint product model has a number of implications that may differ from those of a pure public good model.[10] If impure public defense outputs

are present so that force thinning occurs, then alliance membership size restrictions must be based on these thinning considerations. Private and pure public defense outputs are not germane to the size issue. This follows because private benefits are not shared, while pure public benefits do not diminish with increases in alliance size. In terms of thinning,[11] additional allies should be admitted until the marginal benefits from reduced cost, as more allies share provision expense, match the marginal thinning costs imposed on the alliance. The latter stems from a given size arsenal and military manpower being made to protect a longer perimeter as a new ally joins. Another implication concerns the extent of suboptimality. As private and impure public benefits increase as a proportion of the jointly produced defense outputs, allies will increasingly reveal their true willingness to pay either through markets or clublike arrangements. Clubs could charge members for deployments of weapons and troops, not unlike what happened during the Gulf War of 1991. Moreover, the existence of private nation-specific joint products provides an incentive for nations to contribute even though they are relatively small. Defense burdens may be shared in terms of the distribution of ally-specific gains rather than in terms of size. A small ally, faced with domestic unrest and country-specific threats (e.g., Israel), may carry a large burden in terms of the percentage of GDP devoted to defense even in an alliance with a much larger ally (e.g., the U.S.). Another implication concerns non-neutrality when income is redistributed among a set of allies. Thus, burden sharing and the distribution of welfare among allies can be influenced by taxing or other income policy.[12]

FULL INCOME AND DEMAND FUNCTIONS

To devise a procedure for distinguishing between the demand function for

the pure public good model and the joint product model, we introduce the notion of full income, F, which includes the sum of income and the value of spillins (Bergstrom, Blume, and Varian 1986). With the standard pure public good model, real income enters the model in the same manner as spillins, $\tilde{Q}^i$, since both cause a parallel outward shift of the budget constraint when graphed in (y, Q) space.

In the case of joint products, the resource constraint becomes

$$F^i \equiv I^i + p\tilde{Q}^i = y^i + pQ^i \qquad [25]$$

when the value of spillins, $p\tilde{Q}^i$, are added to both sides of equation 22. The utility function of ally i in equation 21 can be rewritten as

$$U^i = U^i(y^i, Q^i, \tilde{Q}^i, T) \qquad [26]$$

by noting that $q^i = Q^i - \tilde{Q}^i$. Maximizing utility subject to equation 25 yields FOCs that can be expressed as ally i's demand for defense:

$$Q^i = Q^i(F^i, \tilde{Q}^i, p, T), \qquad [27]$$

where Q^i is the alliancewide defense activity level.

<u>At a Nash equilibrium</u>, demand level for Q by all of the allies must satisfy equation 27, and, moreover, Q^i must equal Q for all i. With joint products, an ally's demand for the defense activity is influenced in two ways by an increase in the other allies' spending on defense: indirectly through full income (because spillins are part of full income), and directly through spillins. Hence, a change in spillins affects the mix between private and pure public outputs. This follows because no ally-specific benefits are gained from $\tilde{Q}^i$.

DISTINGUISHING BETWEEN PURE PUBLIC AND JOINT PRODUCT MODELS

Unless a full income approach is employed, the reduced-form equations

for defense demand will not be distinguishable between the two models when general utility functions are used and there is no means for observing the δ and σ productivity parameters. These models can be easily distinguished with the use of a nested test procedure, provided that the respective defense demand equation systems are expressed in terms of full income (Sandler and Murdoch 1990). The defense demand equations for the pure public good model derives from

$$\max_{y^i,Q^i} (U^i(y^i, Q^i, T) \mid y^i + pQ^i = I^i + p\tilde{Q}^i), \qquad [28]$$

and equals

$$Q^i = Q^i(F^i, p, T), \qquad i = 1,\ldots,n. \qquad [29]$$

A comparison of equations 29 and 27 indicates that the latter is nested in the former, since only the $\tilde{Q}^i$ term is missing from equation 29. The equation system in equation 27 can be estimated using two-stage least squares (2SLS). An F-test can then be used to determine the significance of the coefficient on the $\tilde{Q}^i$ variable. If this coefficient is not significantly different from zero, then the pure public good model is more appropriate. In a test of a sample of ten NATO allies using data from 1956-1987, Sandler and Murdoch (1990) found the coefficient on spillins to be significantly different than zero for all sample allies, thereby supporting the joint product specification.

THEORETICAL EXTENSIONS

Theoretical extensions to the economic theory of military alliances has primarily involved either an augmentation to the pure public good model or the joint product model.[13] Insofar as extensions to the pure public good model can be easily applied to the joint product model, the presentation is focused

on the pure public good model. Extensions involve the basic structure of the latter model and, as such, concern the manner for aggregating defense contributions (i.e., the technology of public supply aggregation), the allowance of cost differences among allies, and the means for treating threat. Other extensions involve the allocation process, the trading issue, and the institutional structure. Each of these are considered below.

AGGREGATING DEFENSE CONTRIBUTIONS AMONG ALLIES

The technology of public supply or the social composition function refers to the method used to aggregate the defense contributions among the allies. Thus far, a summation technology has been used. Imperfect substitutability is allowed by the following technology,

$$Q^i = \sum_{i=1}^{n} w^i q^i, \qquad i = 1,\ldots,n, \qquad [30]$$

where $0 \leq w^i \leq 1$ for all i. The w^is act as weights. Adjustment of these weights can allow for a wide range of models including the case where defense is private among allies and the case where defense is perfectly substitutable among allies so that the weights are 1. Once unequal weights are added, the defense activity is impurely public among allies.

McGuire (1990) introduced an important generalization of this weighting scheme by defining the technology as

$$Q^i = q^i + \sum_{j \neq i} w_i^j q^j, \qquad i = 1,\ldots,n, \qquad [31]$$

where $w_i^j \geq 0$. On the weights, the superscript identifies the producer, while the subscript identifies the consumer. McGuire allowed for the case where w_i^j exceeds 1, so that some members have "strategic or symbolic dominance" (1990, 19). With the technology in equation 31, the FOCs for Pareto optimality are as follows:

$$MRS_{Qy}^i + \sum_{j \neq i} w_j^i MRS_{Qy}^j = p, \qquad i = 1,\ldots,n. \qquad [32]$$

In equation 32, the indexes on w still relate superscripts to producers and subscripts to consumers, but the roles of the i and j dummies have been switched. McGuire (1990, 21-24) defined three important simplifications for spillins: (1) consumer specific spillins with $w_j^1 = w_j^2 = \ldots = w_j^n = w_j$ for $j \neq i$ and $w_j^i = 1$, (2) producer specific spillins with $w_1^i = w_2^i = \ldots = w_n^i = w^i$ for $j \neq i$ and $w_i^i = 1$, and (3) uniform spilins with $w_j^i = w$ for all $j \neq i$. For consumer specific spillins, the efficiency condition in equation 32 becomes

$$MRS_{Qy}^i + \sum_{j \neq i} w_j MRS_{Qy}^j = p, \qquad i = 1,\ldots,n, \qquad [32a]$$

while for producer specific spillins, equation 32 becomes

$$MRS_{Qy}^i + \sum_{j \neq i} w^i MRS_{Qy}^j = p, \qquad i = 1,\ldots,n. \qquad [32b]$$

Finally, we get

$$MRS_{Qy}^i + \sum_{j \neq i} w MRS_{Qy}^j = p, \qquad i = 1,\ldots,n, \qquad [32c]$$

for uniform spillins.

The implications of these specific structures are drawn out in McGuire (1990, 23-24) and involve the determination of individual marginal prices among allies and, in consequence, the optimal assignment of burdens under ideal circumstances. McGuire also showed the influence that these spillin relationships would have on Nash equilibrium.

Based on the work of Hirshleifer (1983), an important technology for aggregating public supply is that of weakest link in which

$$Q = \min\{q^1,\ldots,q^n\}, \qquad [33]$$

so that the smallest provision level of the alliance determines the security or defense level for the entire alliance. Weakest link may apply to the scenario where a military alliance fortifies a perimeter against a common threat. If alliancewide security depends on keeping the enemy from breaking through, as was true in World War I and II for conventional warfare, then the

least-fortified front can be used to measure collective security. With weakest link, participants tend to match the defense contributions or efforts of the smallest contributor. Suboptimality is less of a concern, especially when allies' tastes and endowments are similar. Moreover, income redistributions among allies can be used to increase alliancewide defense levels.

A contrasting technology is best shot where

$$Q = \max\{q^1,\ldots,q^n\}, \qquad [34]$$

so that alliancewide security solely depends on the largest individualized defense effort. An alliance that relies on the nuclear deterrence of a single ally, such as NATO in the 1950s, is expected to abide by the best shot technology. Suboptimality is a more significant problem with best shot than with summation, since most smaller allies will attempt to free ride with best shot. There is little reason for small allies to fortify when their security only depends on the single largest effort within the alliance. Equalizing income among allies will reduce defense efforts as the largest ally loses endowments. Alternative technologies can combine aspects of best shot and weakest link. In a recent article, Conybeare, Murdoch, and Sandler (1992) attempt to determine the underlying technology of four alliances: Triple Entente, Triple Alliance, NATO, and the Warsaw Pact. The former two alliances were instituted prior to World War I. These authors found the Triple Entente (the aggressor) to abide by best shot and the Triple Alliance (the defender) to abide by weakest link. The latter two alliances appeared to correspond to a summation technology.

COST DIFFERENCES AMONG ALLIES

In Olson and Zeckhauser (1966), all allies were assumed to face the same

relative price for the defense activity in terms of the numéraire. Many subsequent studies assumed no price differences among allies. When cost differences are introduced, burden sharing patterns may not adhere to the exploitation hypothesis, especially if the low-cost producers are some of the smaller allies. Olson and Zeckhauser (1967) were the first to allow for differences in the marginal cost for defense among allies. With cost differences, the low-cost producer should, ceteris paribus, provide more of the defense output. If the marginal costs of defense are constant but differ between allies,[14] then Pareto-optimal conditions like equation 32 would require the prices to be indexed by the country providing defense. Similarly, prices would have to be indexed in the Nash conditions to allow for price differences among allies. The comparative advantage theme has been developed in a series of articles that include Boyer (1989, 1990), Jack (1991), Jones (1988), and Sandler and Cauley (1975). The Boyer (1989) article is noteworthy, since it permits allies to specialize in different public goods, including defense and foreign aid, that are then traded among allies. If the traded public goods possess significant nonexcludable benefits, then difficulties in the analysis can arise. Oneal (1990a, 439-40) correctly noted that the inclusion of foreign aid is unlikely to alter conclusions regarding exploitation, because defense expenditures are so much larger than foreign aid.

In a recent article, Wong (1991) applied modern trade theory to examine burden sharing behavior between two allies that trade private goods, while facing a common enemy. Defense production can now have two influences: a terms of trade effect and an externality or spillin effect. An increase in the defense production of one ally affects the allocation of inputs between tradable private goods and a defense good. When defense production increases,

the demands for factors are affected and this can, in turn, raise input prices. The relative prices of tradable goods or the terms of trade can then be altered. Scenarios can arise in which an ally's production of defense adversely changes the terms of trade faced by its allied trading partner; hence, spillins may come at a costs as terms of trade deteriorate. In such cases, there is less opportunity to free ride and defense burden sharing may be affected. The interested reader should consult Wong (1991) for a fuller discussion of myriad cases in a framework that extends the geometry displayed in Figures 1-3.

ANALYZING THREAT

Thus far, threat has been treated as an exogenous factor. An increase in threat is expected to shift each ally's reaction path in Figure 2 to the right, thereby increasing the alliancewide defense levels in the new equilibrium. A distinction is, however, needed between the role of threat in the alliance model from that in arms race models. The alliance model is a static (equilibrium) analysis, whereas the arms race model is a dynamic analysis. Given its static nature, the alliance model is not particularly well-suited to showing the <u>interactions</u> between allies and adversaries. Reactions to threat are, therefore, rather artificial in the economic theory of alliances. To circumvent this difficulty, the model needs to be extended to a repeated game framework involving two or more periods.

There are a number of ways of introducing threat in the standard model, while maintaining threat's exogenous status. A security function, S, can be defined so that

$$S = S(Q, T), \qquad [35]$$

with $\partial S/\partial Q > 0$ and $\partial S/\partial T < 0$. An increase in the ally's own defenses or those

of its allies augments security, whereas an increase in the opposing alliance's arsenal reduces security (Smith 1980, 1989). A particularly simple form for equation 35 is the linear form,

$$S = q + \bar{Q} - T, \qquad [36]$$

used by Bruce (1990, p. 81). Other forms include the constant elasticity of substitution (CES) form and the Cobb-Douglas form.

If the interactions of the adversaries are taken into account, then the level of threat becomes endogenous, insofar as a Nash equilibrium can be defined in terms of the best responses of the opposing nations. Following Bruce (1990), we intend to tailor the graphic technique to present the case of two adversaries, which are denoted by superscript h for home and e for enemy. In the absence of allies, the home country faces the following problem:

$$\max_{y^h, q^h} \{U^h(y^h, q^h - q^e) \mid y^h + pq^h = I^h\}, \qquad [37]$$

where q^e is threat or T and a linear security function is assumed. By interchanging the h and e superscripts, we have the problem for the enemy country. The demand for security, S^i, is

$$q^i = S^i(I^i - pq^j, p) + q^j, \qquad i,j = h,e, \quad i \neq j, \qquad [38]$$

in the opposing nations, where $I^i - pq^j$ is now full income. These equations are derived from the FOCs associated with equation 37.

The budget-constrained utility function can be displayed in (q^h, q^e) space, as in Figure 4. Since q^e decreases the utility of the home country, the iso-utility curves for nation h have the opposite convexity to those of Figure 1; the convex set of weakly preferred allocations are on or below the iso-utility curve. Curve I^1I^1, which is closer to the q^h horizontal axis, represents a higher level of utility than that of curve II. The Nash reaction path connects the points of zero slope and is expected to be positively

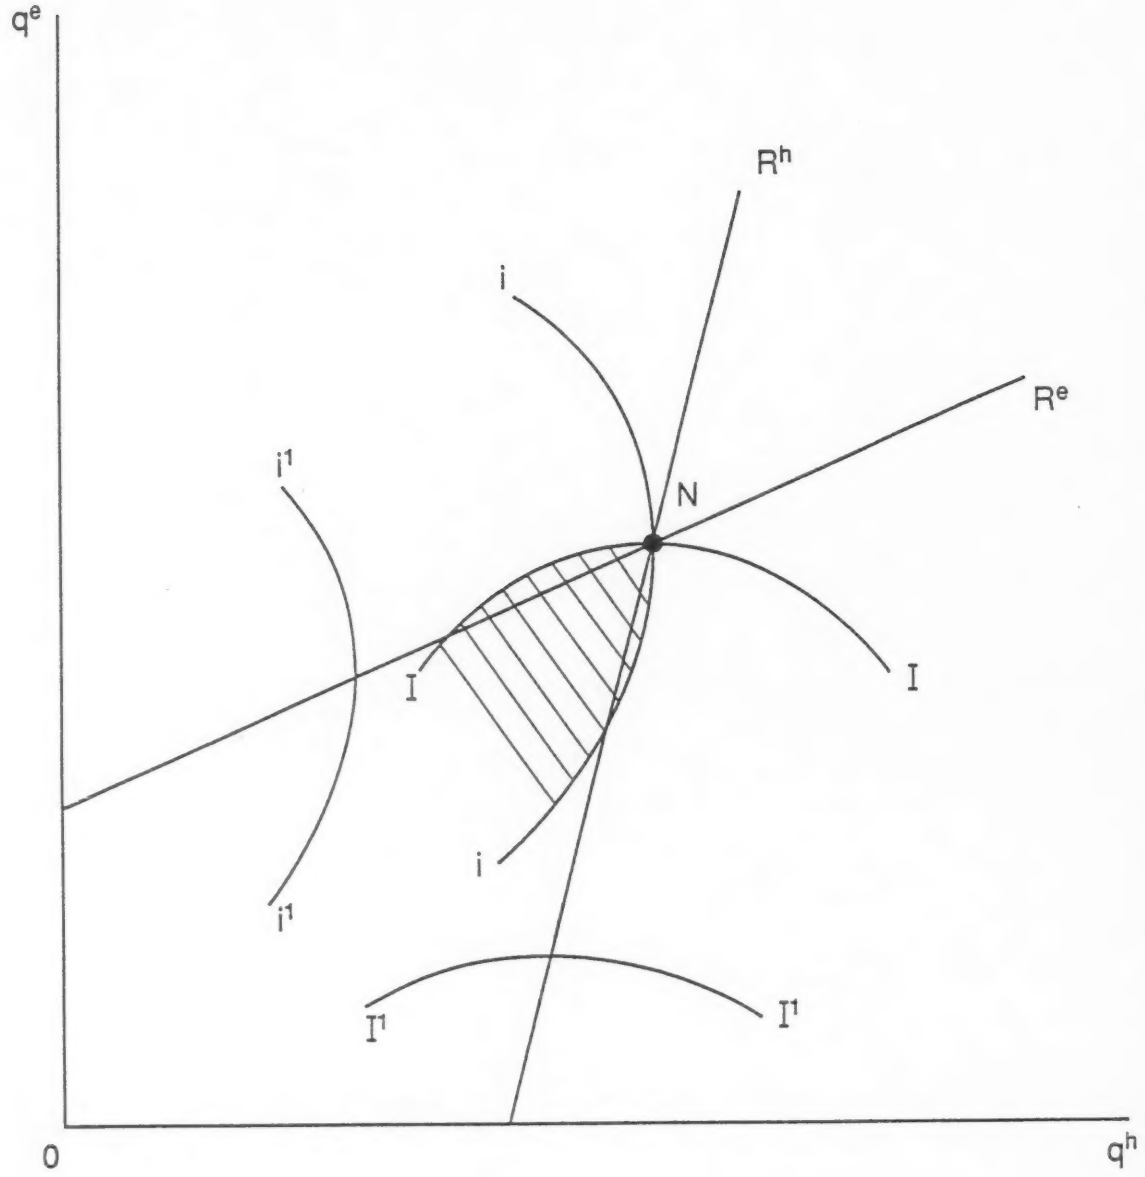

Figure 4: Adversarial Iso-Utility Curves

sloped, since

$$\partial q^h/\partial q^e = 1 - \partial S^h/\partial F^h > 0, \qquad [39]$$

for normal goods where $F^h = I^h - pq^e$. A similar analysis holds for the iso-utility curves of the enemy, also shown in Figure 4 The Nash equilibrium is at point N where the two reaction paths intersect. Both nations can be made better off if they were to agree to reduce defense expenditures. An increase in the defense levels of an adversary is apt to lead to the other country increasing its own defense level.

The analysis can be extended to include adversarial alliances that contain multiple allies. For this more general case, security in the home alliance becomes

$$S = q^i + \sum_{j \neq i} q^j - \sum_{k=1}^{m} q^{ek}, \qquad [40]$$

where q^{ek} is the defense level in the kth ally of the m-member enemy alliance. Weights could be applied to the defense efforts to distinguish between alliances or among allies. The mathematical analysis is easily extended when allies and adversaries are present. With more than three nations, symmetry assumptions must be introduced to extend the graphic analysis (see Bruce 1990, 189-93). An interesting result is the case in which a cooperative agreement among the allies to supply more defense leads to a perverse outcome that worsens the well-being of the allies and the adversary (Bruce 1990, 190-93). This follows because the increased spending of the allies over the Nash noncooperative level induces the adversary to spend more on defense, thereby leading to a scenario where more is allocated to defense all around but security stays the same. The whole notion of suboptimality of defense provision must be reconsidered when adversaries' reactions are included. Increased military expenditures, whether through greater cooperation among the

allies or unilateral actions on behalf of an ally, do not necessarily boost security when enemy defense expenditures respond positively to these increased allied expenditures.

Thus far, adversary expenditures have been introduced in a very simplistic fashion as a linear offset to the ally's own defense efforts. More complicated and realistic mappings for including enemy defense efforts exist. For instance, the incremental effect of an enemy's defense effort on ally's security may diminish as the enemy's arsenal is expanded. If enemy and allied defense efforts are made interactive in the theoretical model, then the empirical model must include enemy and allied demand equations in an interactive simultaneous-equation system that recognizes that the error terms are not independent between equations. To date, most empirical studies have treated enemy defense expenditures exogenously.[15]

THE ALLOCATION PROCESS

The standard allocative process that underlies the economic theory of alliances is Nash, so that a noncooperative, zero-conjectural equilibrium is assumed. By zero conjectures, we mean that each ally assumes that the other allies will not react to its defense decision. This is a consistent expectations equilibrium whenever each ally assumes that its counterparts use a best-response defense level and all choices are simultaneous.

McGuire and Groth (1985) have extended alliance theory to include other kinds of allocative processes. In particular, they considered a Lindahl process in which allies are assumed to meet and exchange information concerning the level of defense, whose costs are met by individualized cost shares. That is, the ith ally pays t^i of the total cost, pQ, of defense. Moreover the shares must sum to one so that full costs are covered. For the

pure public good model, the ith ally's problem is

$$\max_{y^i, Q^i} (U^i(y^i, Q^i, T) \mid I^i = y^i + t^i p Q^i). \qquad [41]$$

A Lindahl equilibrium is obtained when there exists a set of cost shares such that the associated FOCs are simultaneously satisfied for all allies at an identical level of alliancewide defense; hence, $Q^i = Q$ for all i. The FOCs can be used to derive a system of defense demand equations that can be tested against the Nash-based system (Sandler and Murdoch 1990). Alternatively, Oneal (1990b) developed an empirical test for Lindahl versus Nash behavior based on a graph from McGuire and Groth (1985, 921) that relates defense expenditures to wealth. For unit prices, Nash behavior implies a linear expenditure function with a negative y-intercept; Lindahl behavior implies an expenditure function out of the origin with a smaller slope.[16] Thus, Oneal (1990b) regressed ME shares on GDP shares for NATO and examined whether the slope and intercept declined with time to test for increased cooperation. Other tests for cooperative behavior were given in Oneal (1990b) and Palmer (1990a, 1990b, 1991).

McGuire and Groth (1985) also examined hybrid cases in which Nash and Lindahl behavior are combined so that one set of allies abides by Nash and another set by Lindahl. Bruce (1990) investigated leader-follower behavior, in which the leader (presumably the larger ally) moves first and the follower moves second. Leader-follower behavior may well apply to an asymetric alliance with a large dominant ally--e.g., the U.S. in NATO or the former Soviet Union in the former Warsaw Pact. The follower is assumed to take the leader's defense level as given, so that the follower behaves as in a Nash model. In contrast, the leader takes the follower's reaction path as given and optimizes utility subject to its own budget constraint and to the

follower's reaction path. In a figure like Figure 2, an equilibrium occurs when the leader's iso-utility curve is tangent to the follower's reaction path. The slope of the follower's reaction path constitutes the leader's conjectural response for the follower and is nonzero. Since this conjecture is negative, the leader's defense level and alliancewide defense are expected to fall relative to the Nash equilibrium.

INSTITUTIONAL ARRANGEMENTS

A Nash framework ignores the institutional issue by making alliance behavior noncooperative. Allies pool their arsenals, while making allocative decisions independently. In the standard theoretical model each ally is represented by some unspecified decision maker (see, e.g., Oppenheimer 1979). Institutional structures can be investigated in at least two ways: (1) specification of a cooperative structure among allies, and (2) specification of a different set of decision makers within the ally. The first can be handled by designing a supranational structure that can tax its allies or enforce decisions on its members. In a recent article, Weber and Wiesmeth (1991, 191-96) considered a quasi-equalitarian equilibrium, whereby tax shares are assigned by the alliance based on individual benefits received by the allies. Sandler and Forbes (1980) and Cauley, Sandler, and Cornes (1986) indicated that the analysis of institutional structures for alliances must include transaction costs and transaction benefits associated with alternative structures. The structure with the greatest net transactional benefits is the best. Analyses such as Weber and Wiesmeth (1991) do not incorporate the transaction costs component and, hence, remain partial in nature.

The second means for accounting for institutional considerations is to focus on the decision maker within the alliance. For example, a public choice

approach might permit defense spending levels to be determined by a referendum. If this is the case, then a median voter model may apply, so that the median voter's demand for defense determines allocations. Another possibility is a bureaucratic model in which a defense bureau decides defense levels.[17] Each alternative institutional arrangement has its own equilibrium outcome. Transaction cost considerations also concern group or alliance formation. Large fixed transaction costs inhibit formation and may depend on group size. Furthermore, transaction cost involves the determination of optimal alliance size. More work in this area is needed.

TESTS OF THE THEORY

Since 1966, a great deal of attention has been paid to testing the economic theory of alliances. A number of issues are relevant. First, the form of the variables is important. In some studies (e.g., Murdoch and Sandler 1984), real military expenditures (ME) is the dependent variable and GDP and spillins are the independent variables. In other studies (e.g., Russett 1970), defense burdens (measured by defense expenditures as a proportion of GNP) and GNP are the variables. The form of the variable depends on what is being investigated and the antecedent theory. When the demand for defense or reaction function is being estimated, then ME, GDP, and spillins are usually among the relevant variables. If, however, Olson's exploitation hypothesis is examined, then a measure of defense burdens, such as ME/GNP, and a size variable (GNP) are appropriate variables. When free riding is studied using the demand for defense function, a negative and significant coefficient on the spillin variable reflects free riding. If, instead, free riding is associated with the exploitation hypothesis, then a positive and significant correlation or relationship between ME/GNP and GNP is

indicative of free riding. The two tests usually, but not always, give similar conclusions. A second issue concerns the pooling of data across allies when testing relationships. In the case of demand estimates, time-series data should be used to estimate each ally's demand equation separately or within a demand system. Tests can then be performed to determine whether some or all of the equations are sufficiently similar to justify pooling. When testing for overall alliance behavior (e.g., cooperative versus noncooperative), the researcher often pools over the alliance or some cohort, such as the small allies. A third issue involves the antecedent model. For demand studies, the antecedent model is utility maximization that may include a general or specific utility function. In studies concerning exploitation, the antecedent model is Olson's collective action formulation.

Much important work has been done on the exploitation hypothesis. Olson and Zeckhauser (1966) presented a distribution-free or nonparametric correlation test to demonstrate that defense burdens were positively correlated to the NATO allies' GNP in the mid-1960s. Russett (1970) used nonparametric statistics to test the exploitation hypothesis for a number of alliances and found a significant positive correlation for the Warsaw Pact, CENTO, SEATO, and NATO. Starr (1974) also uncovered a significant positive correlation between defense burdens and GNP for the Warsaw Pact for 1967-1971. Other studies of the exploitation hypothesis included Oneal (1990a, 1990b, 1992), Pryor (1968), van Ypersele de Strihou (1967), Sandler and Forbes (1980), and Murdoch and Sandler (1982).

Most empirical studies of alliances have used parametric test statistics based on either single-equation or simultaneous-equation regression estimation. Although the bulk of the studies focused on burden sharing in the NATO alliance, some have examined other alliances such as the U.S.-Israeli

alliance, the Triple Alliance,[18] the Triple Entente, the Australian-New Zealand-U.S. alliance (ANZUS), and the U.S.-Japanese alliance. In Table 1, some representative empirical studies are listed along with the alliances that they studied. As indicated, the underlying theoretical models for these studies were either a variant of the pure public good model or the joint product model.

Many parametric tests attempted to estimate an ally's demand for defense or its military expenditures equation. Most estimates can be encompassed by the following general function,

$$ME = f(INCOME, PRICE, SPILLIN, THREAT) \qquad [42]$$

in which ME is military expenditures of the nation, INCOME is some GDP measure, PRICE is the relative price of defense (if available), SPILLIN is the aggregate military expenditures of the other allies, and THREAT is the military expenditures of the enemy. Insofar as the allies' demands may be influenced by similar factors, the error terms are often not expected to be independent. To account for this influence, investigators have either allowed for contemporaneous correlation between equations, or else a simultaneous-equation system. In the former case, seemingly unrelated regressions are used to derive estimates; in the later case, two-stage least squares is employed.

Table 1 indicates the estimation procedure under the heading "empirical model." Important conclusions or results for each of the investigations are also listed, as is the time period of estimation. A number of features are worth highlighting. First, when tested against one another, the joint product model outperformed the pure public good model (Sandler and Forbes 1980; Sandler and Murdoch 1990). Second, studies increasingly used simultaneous-equation estimations in recent years to account for the underlying interactions between the allies. Many of the earlier single-equation

estimates used lagged spillins. Third, only a few exercises built a simultaneous-equations model in which enemy demand is one of the equations (e.g., McGuire 1982). Fourth, many studies found allies to respond positively to spillins, thus supporting the notion of complementarity between defense joint products. Fifth, threat did not always perform as hypothesized, since in a number of studies defense demands did not respond positively to threat. Sixth, some studies found that military doctrine affected the demand for defense (Murdoch and Sandler 1984, 1986; Sandler and Murdoch 1986), but other studies presented opposite findings (Oneal and Elrod 1989; Oneal and Diehl 1992). Methods differed significantly between these researchers and may be responsible for the alternative outcomes. Seventh, free riding was not as prevalent as presupposed in the demand studies of alliances (e.g., Conybeare and Sandler 1990). Free riding was more frequently identified in the studies based upon the exploitation hypothesis. Eighth, the demand-based study that estimated separate equations for the allies supported Nash behavior over Lindahl (Sandler and Murdoch 1990), while studies that used pooled data supported the Lindahl or bargaining model (Palmer 1990a, 1990b, 1991; Oneal 1990b).

CONCLUDING REMARKS

Based on the theory of public goods, the economic study of alliances has a long tradition. As modelling advances have occurred in public good analyses, these have been subsequently incorporated in the study of alliances. Theoretical extensions have included the introduction of joint products, the endogeneity of threat, the variation of the underlying game structure, the utilization of different technologies of public supply, and the allowance of cost differences among allies. Future extensions should build more complex

interactions between opposing alliances, while accounting for intra-alliance interactions. Moreover, allocative processes other than Nash, Lindahl, and leader-follower need to be examined. A repeated game structure should also be given to the alliance model so that a sequence of actions between opposing alliances and among allies is allowed. In addition, informational asymmetries within and between alliances need to be incorporated into the analysis. Alliance configurations should be studied for partitioning a set of nations. This extension involves finding the core in which no alternative grouping of allies can do better. Finally, work is needed to sort out empirical findings that appear contradictory.

FOOTNOTES

1. The utility function is assumed to increase in y^i and Q, and to decrease in T. Moreover, the utility function is assumed to be strictly quasiconcave in y^i and Q.

2. A nation may choose to self protect against invasion. That is, the nation raises its defense expenditures to increase its probability of survival.

3. If the associated 3 by 3 Hessian determinant of second-order partials of the Lagrangean function is strictly positive, then the three-equation FOCs can be solved for y^i and q^i in terms of the exogenous variables.

4. Examples include Conybeare and Sandler (1990), Dudley and Montmarquette (1981), Gonzales and Mehay (1990), Hansen, Murdoch, and Sandler (1990), McGuire (1982, 1990), McGuire and Groth (1985), Murdoch and Sandler (1984, 1985, 1986, 1991), Sandler and Murdoch (1986, 1990), and Smith (1989).

5. See Sandler (1992, ch. 2) and Cornes and Sandler (1986, ch. 5) for a fuller discussion of these iso-utility curves.

6. On joint product models see Conybeare and Sandler (1990), Cornes and Sandler (1984, 1986), Hansen, Murdoch, and Sandler (1990), McGuire (1990), Murdoch and Sandler (1982, 1984, 1985, 1986, 1990), Murdoch, Sandler, and Hansen (1991), Oneal and Elrod (1989), Sandler (1977, 1988), Sandler and Cauley (1975), Sandler and Forbes (1980), Sandler and Murdoch (1986, 1990), and Thies (1987). On private benefits, also see Knorr (1985), Oneal (1990a, 1990b), Russett (1970), and Oneal and Diehl (1992).

7. For a further discussion and additional examples, see Murdoch and Sandler (1984) and Sandler (1977, 1988). For a dissenting view, see Oneal (1991) and Oneal and Diehl (1992).

8. The $f(\cdot)$, $g(\cdot)$, and $h(\cdot)$ functions can be allowed to differ among

allies to increase the generality of the model.

9. For a proof, see Cornes and Sandler (1986, 118-21). This positive slope to the Nash reaction path is especially noteworthy regarding Palmer (1990a, 1990b), who tested for cooperative behavior based on there being a positive relationship between U.S. defense burdens and those of the allied states. For complementary joint products, a positive relationship may be consistent with Nash noncooperative behavior.

10. These implications are developed in Sandler (1977), Murdoch and Sandler (1982), Sandler and Forbes (1980), and Sandler and Posnett (1991).

11. The thinning relationship depends on a host of factors including geographical consideration, topographical factors, and technological factors.

12. See Andreoni (1989, 1990), Cornes and Sandler (1984), and Sandler and Posnett (1991).

13. See Conybeare (1992) for a new approach in which alliances are characterized as diversifying risk. Also see Jack's (1991) dissertation.

14. In fact, marginal cost is decreasing over some range of output. If marginal cost decreased without end, then a single ally should supply the defense needs of the other allies through market transactions.

15. Exceptions are McGuire (1982) and Hilton and Vu (1991).

16. The Lindahl result depends on the utility function being Cobb-Douglas. This and other assumptions limit the generality of the test.

17. See Dudley and Montmarquette (1981) and Murdoch, Sandler, and Hansen on median voter models, and Gonzales and Mehay (1990) and Jones (1992) on bureaucratic models.

18. On historical alliances, see Thies (1987), Conybeare and Sandler (1990), and Conybeare, Murdoch, and Sandler (1992).

GENDER IN THE 1992 ELECTORATE

Virginia Sapiro

Prepared for the Annual Meeting of the American Political Science Association, Washington, D.C., 1993

GENDER IN THE 1992 ELECTORATE

One of the perennial questions in the study of gender politics is whether there are gender differences in mass level political thinking or action during elections. For a long time both conventional wisdom and some research claimed there were many important differences. Certainly men were more active in campaigns and more likely to vote than women from the time women gained the right to vote until recently. Men used to claim more interest in elections. American women leaned more toward the Republican party than men during the 1950s, but this pattern reversed since the 1960s. Gender differences were especially stark during the 1980s elections, giving rise to widespread discussions of the "gender gap."

The scholarly literature has often discussed other possible gender differences in electoral politics. Conventional wisdom has long claimed that regardless of the existence of "bottom line" gender differences in voting during any given election, women and men engage in different kinds of thinking and decision-making to cast their votes, perhaps using different criteria. Women were said to be more candidate-oriented than men and, in particular, to pay attention to looks and personality. Scholarly evidence for this claim, however, has not been uncovered (Shabad and Andersen 1979).

Continuing interest in gender differences in public opinion and, specifically, a "woman's point of view" (Sapiro 1983) has led many observers to posit the existence of gender differences in issue attitudes that, in turn, lead to different political judgments or behavior during elections. The interdisciplinary influence of Carol Gilligan's (1982) developmental theory of gender difference and, more generally, the renewed interest in gender difference in feminist studies since the 1980s has led to widespread speculation about men's and women's thinking is structured by different value orientations. In the ubiquitous search for gender differences in public opinion empirical results reveal relatively few consistent differences over time other than in attitudes toward war and violence (Shapiro and Mahajan 1986; Conover and Sapiro 1993).

Research on gender differences, especially in political thinking and behavior, often pass silently over the fact that an important underlying question is not just whether women and men differ in their opinions, attitudes, values, or behavior, but whether their thinking and behavior is structured differently. The implication of some of the claims of difference, especially that sparked by literature on cognitive and moral development, is that while men and women might vote differently because their votes are driven by different elements of political evaluation (e.g. candidates versus issues or justice versus care), we could witness men and women voting similarly but for different reasons. The pursuit of similarity or difference in attitudes or votes does not tell us all we need to know.

Nor can we leap to the conclusion that gender differences in electoral responses stemmed from any simple gender-based pull of "women's issues," conventionally understood; the gender gap has been most convincingly attributed to different responses to economic and defense issues (Frankovic 1982; Mueller 1988). Nevertheless empirical

research does suggest that these differences may emerge most specifically between men and feminist women, or that gender or feminist consciousness may be the medium through which gendered points of view are created (Conover 1988, Tolleson Rinehart 1992). In other words, the gender gap may emerge from the interaction of feminist and other attitudes. In order to pursue this possibility further it is necessary to explore the structure of political thinking and not just attitude differences.

Just as many leaders in the gender politics field were arguing there was too much emphasis on electoral research, curiosity about gender differences in electoral behavior was piqued by the varying appearance of the "gender gap" since 1980. This variability points to another probable element of electoral gender difference that requires research: The gender gap is due not to "constant" gender differences in attitudes or attitude structures, but rather is driven at least in part by context. Gender gaps may appear and disappear, rise and wane because some aspect of the electoral context must trigger or cue gender as politically or symbolically important in a given election. The cuing might occur because of the confluence of issues or personalities in an election or because of historical events or circumstances surrounding the electoral period.

Context may cue gender relevance in an election in a very direct manner. This is what would happen when gender is regarded as "an issue" in a campaign. But there may also "spillover" effects that occur when gender is cued. Theoretical work on symbolic politics suggests that given the multiple possible meanings of any given event or problem, their specific political meanings are at least partly socially constructed and will differ in the eyes of observers placed at different vantage points (Edelman 1964, 1977). Issues may take on gendered meanings or not depending on context and perspective. The mere presence of gendered pronouns in a sentence changes the way it is interpreted, (cite); the mere presence of women or "women's issues" in an electoral campaign may change its meaning as well.

The dynamics of gender politics became especially interesting during the 1992 presidential election. Anticipation grew during the course of that year as press hyped the "Year of the Woman." Instantly developed conventional opinion within the press, supported by claims on the part of many interest group leaders and some candidates painted the election as one in which gender would play a key role: Women were energized by the Thomas/Hill hearings, and perhaps further bolstered by two major rape trials. The two major party candidates offered apparently clear choices on "women's issues," conventionally understood (abortion, women's rights, parental leave) and on other sometime gender-divided questions such as defense, health care, and other social policies. The culture wars skirmish at the Republican convention and the continuing symbolic importance of Hillary Clinton during the campaign seemed to lend an emotional element to the gender component of the election. Finally, the extraordinary number of women candidates at all levels was expected to affect the electorate's thinking and behavior on the basis of gender. Thus many observers expected that (1) women would be especially mobilized (2) there would be a gender gap in presidential vote; (3) there would be a gender difference in what interested and motivated the electorate during the electoral campaign.

After the dust settled, what happened? There was certainly an increase in the number of women in office, but most analysis shows this is more the effect of higher rates of female candidacy in open seats higher election rates among women candidates. The gender gap was not as impressive as expected; indeed on national level there was not much of a gender difference in the vote. Clinton attracted a slightly higher proportion of women's votes and Perot garnered more of men's. This gender difference was especially pronounced among the youngest and oldest voters, the most and least educated. It appeared at least as much among African-American as white voters ("Portrait of the Electorate," 1992). But it emerged more in certain states (such as California and Illinois, where there were important races with women candidates), localities, and races. Reports also indicated gender differences emerged in voting where there were referenda relating explicitly to gender issues, such as those on gay rights.

Although demographic portraits of the electorate are useful, more detailed survey analysis is necessary to understand the role of gender in structuring electoral thinking and behavior. The remainder of this paper further explores the mass-level gender politics during the 1992 presidential election using data from the 1992 American National Election Study (ANES), partly to understand the dynamics of that particular election better, and partly to add to and expand on earlier case studies of gender politics in the mass electorate.[1]

METHODS

Our analysis encompasses three general aspects of the election. We focus first on citizen involvement in the election to see the degree to which gender shapes the amount of people's interest in and attention to the campaign, and their final choice to go to the polls. Second, we ask whether gender shapes the ways that people perceive and react to the two major party candidates. What emotional reactions do they provoke? How do citizens interpret their traits and character? Finally we investigate the effect of gender on support for the three alternative candidates in the home stretch. Who voted for them and how enthusiastically?

In each case we employ basic multiple regression models first, to look at the direct impact of gender on electoral responses and second, to investigate the degree to which men's and women's responses are differently structured. The independent variables are selected for any or all of three reasons. First, we include predictors known through prior research to help explain electoral behavior such as race (in this case, whether respondents are African-American or not), age, family income, and education; assessments of federal policies have made the state of the national economy and the state of respondent's family economy better or worse; internal and external political efficacy; core values such as egalitarianism, symbolic patriotism, traditional moralism, and liberalism/conservatism; and, of course, partisanship and retrospective assessments of the incumbent candidate.

Second, we included variables that tapped into the specific circumstances of the 1992 election including relative assessment of Clarence Thomas and Anita Hill; the core

value of traditional moralism; and key issues such as health care, defense, and abortion. Finally, we included variables tapping characteristics and attitudes presumed either theoretically or conventionally to involve gender and gender politics including assessments of Thomas and Hill, feminist consciousness, abortion attitudes, and attitudes on child welfare policy including day care and parental leave. The feminist consciousness variable incorporates not just attitudes toward gender equality, but the degree to which respondents identify emotionally with women.[2] Clearly, many of these variables were justified in more than one of these ways.

Throughout the analysis we begin with analysis incorporating sex as a predictor variable to see its impact while taking account of others reasonably hypothesized to shape electoral behavior. We then divide the sample by sex and run the same analysis to see whether, regardless of direct effects of gender, the same predictors structure electoral thinking and behavior for women and men.

Finally, in some stages of the analysis we take account of a remarkable aspect of the 1992 electoral season: the large number of women running for high office. We coded respondents according to whether they lived in districts in which (1) no women were running for House or Senate seats or for governor or (2) at least one woman was running for one of these offices. We hypothesize that whether the campaigns for the highest offices provides a "stag" environment or not should make a difference for relevance of gender more generally. There are two reasons for hypothesizing that gender context matters. First, in accordance with theories of symbolic politics, because politics is still regarded as a primarily male activity, if even one high-level campaign involves a woman, gender becomes more salient in that political context more generally (Sapiro 1993). But second, and more practically, women's campaigns may have emphasized some issues more than men's did. For one example, women may have calculated that keeping memories of the Thomas/Hill hearings would underscore the need for electing women, especially in a year in which being a "newcomer" was seen as a plus.[3]

POLITICAL INVOLVEMENT

To what degree did gender shape citizen involvement in the 1992 presidential election? We consider three indicators: self-reported interest in the campaign, how often respondents followed news about the campaign, and whether they voted. At the bivariate level men were more interested in the campaign than women (r=.06**) and followed news more (r=.10**), but voted at about the same levels.

The story looks different when also take account of other predictors of political involvement **(Table 1)**. Gender shows no significant direct effects on interest or news attention, but women were more diligent than men in voting when we take account of these other associated variables.

To delve further, let us consider whether different things seem to push women's and

men's involvement as was so often hypothesized in commentary on that election. Were women especially motivated into involvement by reactions to the senatorial treatment of Anita Hill? No; indeed the only significant relationship shows men who felt more warmly toward Hill than Thomas followed the news more than other men. Otherwise, relative feelings for Hill and Thomas bore no relationship to political involvement. Did feminist women become especially involved in the election? To the contrary, if anything those with feminist consciousness -- especially men -- showed signs of distance from the race. Certainly feminist men were less likely to vote than other men. The more strongly people felt about abortion policy (regardless which side they were on) the more interested they were in the campaign and the more likely they were to vote, but strength of feeling about abortion does not play a different role in shaping women's and men's interest. Other results displayed in Table 1 suggests that women's campaign interest was more motivated by the condition of their pocketbooks than was true of men and that this also gave them a bigger push toward the voting booth. Age also played a greater role in women's than men's campaign interest and attention; the older they were, the more involved they were.

It has often been claimed that women were energized into campaign involvement by the presence of so many female candidates; our context variable allows at least a partial test of whether this is true. As **Table 2** shows, the presence of women running in high-level races makes no significant difference for how gender is related to electoral involvement. Although the gender difference in turnout is statistically significant only where women were running, the coefficients are too similar to distinguish.

Although the gender context of the election does not affect gender differences in involvement per se, it does seem to affect the relevance of the Thomas/Hill hearings to the election. Leaning toward Anita Hill was significantly associated with greater campaign interest and following the news more where women were running for office while this was not true in "stag" contexts. Indeed, for all three variables the signs are reversed between all-male and mixed contexts so that support for Hill is associated with involvement in mixed contexts, while support for Thomas is associated with involvement in all-male contexts. Context does not seem to make a difference in how much either feminist consciousness or strength of feelings about abortion moves involvement. The education gap in voting is bigger in all-male contexts than in those where women ran for high office; in contrast the importance of feeling a pinched pocketbook was more important for turnout in mixed contexts. A strong sense of internal political efficacy boosts citizens' likelihood of going to the polls in mixed contexts; it makes less difference in all-male environments.

A closer look at the effect of context shows some different effects on men and women. In all-male contexts family income makes a difference for women but not for men in whether they are interested, follow the news, or vote. In mixed contexts high income does not appear necessary to move women into electoral involvement. Perhaps the presence of female candidates compensates women for lack of the resources usually required to get them involved.

In summary, then, our main findings are that this election continued the recent pattern of women showing at least as much psychological involvement in the election as men, all things considered, but an unusual edge for women in voting turnout. The electoral context played an important role in shaping political involvement, but indirectly, through heightening the relevance of the Senate harassment hearings the year before.

EMOTIONAL REACTIONS TO THE CANDIDATES

The 1992 was in many ways a candidate-centered election. There was an unprogrammatic, unideological incumbent who tried to focus attention on the personal character failings of his main opponent, while a third candidate rested his claim in large part on his own character -- his ability and willingness to "get under the hood" -- and his personal relationship to "the people." The 1992 ANES included four questions asking respondents what emotional reactions the two major party candidates evoked in them. We combined them into two additive indices tapping positive (hopeful, proud) and negative (angry, afraid) reactions. At bivariate level, women had more negative reactions to Bush (r=.07**), less positive reactions to Bush (r=-.08**), and more positive reactions to Clinton (r=.06**) than men, but there were no gender differences in negative reactions to Clinton (r=-.02).

Our multivariate analysis includes the standard demographic variables (sex, age, race, education, and family income), perceptions about the impact of policy on the state of their pocketbooks and the national economy; core values including egalitarianism, liberalism-conservatism, moralism, and symbolic patriotism; feminist consciousness; attitudes toward abortion policy, and partisanship. At multivariate level the direct effects of gender wash out except we still see women reacting more negatively to George Bush **(Table 3)**.

Considering the other bases of emotional reactions, partisanship plays an unsurprisingly large role, although it is especially important in supporting positive emotional reactions to Clinton generally (as though it was relatively difficult to have positive reactions toward him unless one was a partisan) and more important in supporting positive emotional reactions to Bush among women than men (ditto?). Feminist consciousness gave Clinton a more consistent boost among women than among men; indeed men displaying feminist consciousness had more negative reactions to Clinton than men without. Feminist consciousness bore no relationship to positive reactions toward Bush, but did seem to stimulate negative reactions among women and men.

One of the more emotional aspects of the campaign was the "culture wars" struggles revolving largely around a mélange of issues such as feminism, gay rights and other sexual and family matters. Important aspects of the personal campaign against Clinton, including attacks on his wife, were intended to raise fears over character and fears about the moral impact of the electoral outcome. Although certainly involving ideological questions, the "culture wars" theme was expressed largely through rhetorical and emotional appeals rather than through coherent and programmatic policy proposals. Is this aspect of the campaign

reflected in the emotional responses of the electorate as reported in this survey? Certainly traditional moralism moderately depressed positive reactions to Clinton and stimulated negative reactions to him and positive ones to Bush. But our analysis shows no differential effects for men and women. Nor do economic concerns play different roles for men and women in structuring their emotional reactions.

CANDIDATE TRAITS

There is considerable evidence showing that gender can structure person perception which, in turn, suggests that gender can shape perceptions of candidate traits (Hyde 1991, Lips 1993). In other words, we should ask not just whether candidate perceptions play different roles in women's and men's voting decisions, but also whether women's and men's perception of any given candidate's traits and character is necessarily the same in the first place.

The ANES included a series of questions asking respondents how well certain terms described the two major party candidates. We combined one set into a composite trait, LEAD, (intelligent, inspiring, provides strong leadership, knowledgeable, gets things done), another into a composite trait, CARE (compassionate, really cares about people like you), and a third into a composite trait, MORAL (moral, honest). These traits correspond well to those often at issue during the course of the election campaign.

Although for the most part gender had no direct effect on candidate traits perceptions, all things considered women were more convinced of George Bush's moral character than men **(Table 4)**. In light of this it is especially interesting that traditional moralism played a greater role in men's than women's assessment of Bush's moral character. Negative assessments of the economic impact of government policy dragged men's but not women's judgments of Bush's morality down. In contrast, conservatism and family income were positively related to judgments of Bush's morality among women than men. (Indeed, although the coefficients do not reach acceptable levels of statistical significance, the signs show the reverse for men.)

Although gender had no direct impact on judgments of Clinton's morality (and traditional moralism played the same role for men and women), gender shaped these views to some degree. Once again, family income shaped women's views, with wealthier women seeing Clinton as less moral than did less wealthy women. Men's but not women's perceptions of Clinton's morality were shaped by liberal-conservative ideology. Women's view of Clinton's morality, in contrast, was shaped by the core value of egalitarianism; the more egalitarian they were, the more they judged Clinton as moral.

Turning back to the range of traits, feminist consciousness had little or no impact on trait assessment, and did not distinguish women and men. Relative warmth toward Anita Hill suppressed men's and women's perceptions of Bush's leadership, caring, and morality equally but had no impact on assessments of Clinton's character. This result supports the claim that trait assessments are not just extensions of partisan support or even more global

candidate support but are rather made specifically about each candidate. Nevertheless, partisanship shapes women's and men's assessment of candidate traits markedly.

There is some evidence of gender difference in the sources of trait assessment other than morality. Traditional moralism shaped men's views of Bush's leadership and caring moral than it shaped women's. Economics affected men's views of Bush's leadership more than it affected women's. Economic factors played very little role in assessment of Clinton's traits, although the more economically hurt women felt by government policy, the more they thought of Clinton as caring. Men's reaction, if anything, was the opposite. Men's judgements of Clinton's character was also more shaped by their degree of conservatism while women's judgements of Bush's character were shaped by their degree of conservatism.

CANDIDATE SUPPORT

Finally, we turn to overall support for the three presidential candidates. To analyze the role of gender in candidate support we used a dependent variable for each candidate reflecting whether the respondent voted for him and if so, how enthusiastically. For this analysis we employed the same demographic, economic, and other variables as before, but also added questions tapping other key issues in the campaign (child welfare, defense, and health care policy), as well as candidate-centered variables including retrospective assessment of President Bush's performance, positive and negative emotional reactions to the candidate in question (as measured earlier in this paper) and a composite trait assessment obtained by summing the individual traits and ranged from negative to positive.

Our results are surprising at first blush **(Table 5)**. Taking account of the other variables we would expect to play a role, women remain less supportive of Perot than men, as poll results generally show, but more supportive of Bush. Considering the remainder of this analysis as well as that of other analysts of the 1992 election, this result must be explained in terms of the three-way race and especially, the Perot candidacy. Simple demographic analysis shows that Perot drew his support disproportionately from young, white men. Table 5 shows that his support was also disproportionately wealthy among men and generally, was found among those leaning Republican rather than Democratic. The effect of gender on Bush support revealed in Table 5, then, does not suggest that there was an absolute "gender gap," conventionally understood, within Bush voting, but that there was a gendered effect in the trade-off between Bush and Perot voting. Within the camp composed of potential Bush or Perot supporters, there were strong gender effects that kept women in the Bush camp and sent men to Perot.

Turning first to feminism and gender issues, feminist consciousness had no effect on Bush or Clinton support, but it did inhibit support for Ross Perot, especially among women. Warmth for Anita Hill was unrelated to Bush support although it was positively related to Clinton support. More interesting is the connection between Thomas-Hill attitudes and Perot support: male supporters of Perot seemed to lean more toward Clarence Thomas than Anita Hill, although the difference is not statistically significant. Of the three candidates, then,

Perot seems to have drawn the most consistent direct gender basis for support: male, nonfeminist, and (among his male supporters) more sympathetic to Clarence Thomas. Attitudes toward the defense budget and retrospective judgments about the state of the economy played a larger role in determining men's support of Perot, while partisanship distinguished women's support more.

Other interesting gender differences in candidate support emerged as well. Retrospective assessments of Bush's performance as president were not as strongly related to women's support for him as they were to men's support. Nor was women's degree of support for him based as much on their own attitudes toward defense and health policy.

The bases of men's and women's support for Bill Clinton were also somewhat different. Egalitarianism underpinned men's but not women's level of support for Clinton, while women's attitudes seemed shaped more by the specific issues connected with family policy. Also, while income was positively related to Clinton support among women, there was no connection among men. Considering Perot's base of support, race and income had more effect on men in their judgments of Perot than on women.

Overall, then, very similar elements went into men's and women's judgments of the candidates. Partisanship and retrospective assessment of the incumbent played a role for all three. The Republican emphasis on traditional morals made a difference for his support, if not as much for the others'. Whether or not voters had a positive emotional response to Clinton made a difference for him. Overall the range of issues so often discussed in the campaign seemed to make less clear difference for candidate support than might have been expected at the time. But as we have seen, gender did play an important role as well, especially in the politics of Perotism.

As we pointed out earlier, poll results indicate that the size of the gender gap in presidential voting varied from place to place and seemed to be especially pronounced either where there were notable races with female candidates or where referenda seemed to call attention to gender issues. We therefore considered the effect of context on the gender basis of presidential voting, again using the context variable measuring whether the respondent was exposed to any race in which a woman was running for high political office. **Table 6** shows the results.

Gender differences in candidate support are statistically significant for all three candidates only in mixed contexts. In fact, in examining the unstandardized forms the difference between the stag and mixed coefficients statistically significant only in the case of Perot voting. Nevertheless, we are impressed by the consistent results.

Context also made a difference for the relevance of the Thomas-Hill hearings to candidate support. As we hypothesized, warmth toward Anita Hill helped Clinton in mixed contexts more than in all-male contexts. This is largely because of the large impact of context on women. Where women were running for high office, women voters made a

connection between warmth for Anita Hill and support of the Democratic candidate.

A less expected finding was that context also determined the relevance of the Thomas-Hill hearings on Perot support, but in the opposite direction. That is, in mixed contexts warmth for Hill or Thomas had no overall bearing on Perot support, but in all-male contexts warmth for Clarence Thomas was associated with Perot support. Inspection of gender differences within context discloses the dynamics. The association of Thomas with Perot support in all-male contexts can be attributed more to men than to women. For men this association almost disappears in mixed contexts. Among women there is a small but not statistically significant tendency for Thomas and Perot support to coincide in stag settings, while in mixed settings there is a small but not statistically significant tendency for Hill and Perot support to coincide.

Another contextual difference in Perot support fills out the picture some more. While abortion attitudes have little or no bearing on Perot support in stag all-male contexts, in mixed contexts Perot support is drawn disproportionately from the pro-choice camp. This is true of women and men alike. In contrast, in all-male contexts support for larger defense budgets appears disproportionately among male Perot supporters, whereas defense attitudes bear no relationship to Perot support among men or women in mixed contexts. In mixed contexts women who believe their families' pocketbooks have suffered due to government policy are especially drawn to Perot; in all-male contexts this is not the case. In summary, while Perot support was especially white, male, and -- among men -- wealthy and young, the gender context of the election helped to create different bases of support, both among men and women. In stag contexts Perot found favor among men who preferred Thomas to Hill and who resist cutting the defense budget. In mixed contexts although the simple gender difference is reduced, this more conventionally masculine set of attitudes fades as a base of support and instead find some female support (presumably from a potential Bush constituency) encouraged among pro-choice, economically hurt women.

Turning to Clinton support, we note that both retrospective assessment of Bush's performance and evaluation of Clinton's personal traits played less role in determining support for him in mixed contexts than in all-male contexts. This is true of both women and men. For men, by and large, the set of predictors outlined here simply explains less variance in mixed contexts. For women we see some factors come into play in mixed contexts that did not appear in all-male contexts, notably egalitarianism and support for Anita Hill. In all-male electoral contexts higher family income made women more supportive of both Clinton and Bush, whereas wealth made no difference in mixed contexts. In all-male contexts male support of George Bush hinged partly on their liberal-conservative ideology; this was not true in mixed contexts.

To summarize, gender played important direct and indirect roles in sorting out support among the three major presidential candidates. The gender-based electoral context appears to have helped to structure candidate support and its basis.

LOVED HIM, LOVED HER: WHAT DIFFERENCE HILLARY DIDN'T MAKE

Women who are prominent in public life -- especially in politics -- often become endowed with symbolic meanings that reflect not just attitudes toward women in politics, but anxieties about gender and sexuality (Sapiro 1993). Hillary Clinton seemed to serve as a lightening rod for the "culture wars" taking place during the electoral campaign and, indeed, for the early months of the Clinton administration. Hillary Rodham Clinton's name and hairstyle were headline news, and in some quarters she became synonymous for radical feminism or at least some interpretations of it.

With the existence of parallel feeling thermometers we can find out whether there were different bases of evaluation of the candidate and his wife. As **Table 7** shows, the most important predictors of evaluation of these two figures are evaluations of each other, and partisanship. Men seemed to base some of their judgment of Hillary (but not Bill) on their basic political ideology and on their degree of symbolic patriotism (remarkably the "patriots" were positive), and they based some of their judgment of Bill (but not Hillary) on egalitarianism, feminist consciousness, and low traditional moralism. Women's support for Hillary (but not Bill) seemed partly based in their reactions to the Thomas-Hill hearings, and their support for Bill (but not Hillary) was partly based on symbolic patriotism and feminist consciousness. There were no race differences in feelings about Hillary Clinton, but African-American women were disproportionately favorable toward Bill. Hillary Clinton may have taken on rhetorical and symbolic importance for those who were opposed to the Democratic candidate or his party in any case, but the explanation of general mass attitudes toward her is very much bound up with people's orientations toward her party and its candidate for the presidency.[4]

CONCLUSION

As many scholars have been arguing, the simple direct effects of gender pale in comparison to other, mostly more traditional and well-known explanations of electoral behavior. The hype about the year of the women momentarily led some pundits -- generally those not familiar with gender research -- to expect dramatic gender differences overall. This did not happen. Likewise, the growing scholarly view in some quarters that women and men have consistently and substantially different bases and structures of thinking about their social world misses the mark.

This said, our analysis adds to the argument that there are interesting, although often subtle gender differences that, given the right context and circumstance, can make important differences in mass public choice. Certainly gender had interesting and important significance roles during the 1992 elections. But the significance might be missed if we attend only to the simple broad-sweep stories.

People meant different things -- and often vague and ill-defined things -- by the "Year of the Woman." In the first instance this term applied to the unusually large number of women running for public office, especially at the state and federal levels. There were

many reasons for this influx, including especially the simple fact that over the years there had been a build-up of women in the "recruitment pool" of political activists. Two conditions made the structure of opportunities favorable for politically active women contemplating public office. First, there was unusual number of open seats, providing a good setting for newcomers. And second, there was generally a view that the electorate wanted "outsiders," and women remain outsiders to politics symbolically, even though most of the "outsider" women who ran for high office were anything but political neophytes.

In the second instance the "Year of the Woman" referred to the possibility that more women than ever would not just run for high office, but would win. This indeed occurred. But did women win more seats because they ran for more seats or did they win more because they had a higher success rate? At least at the congressional level, the answer seemed to be that their successes could be predicted by traditional models: Women succeeded in winning new seats where they were not challenging incumbents and where their party could normally expect to have a good chance of winning.

The "Year of the Woman" also referred to characteristics of the mass electorate, especially the view that women generally would become especially involved in the election because of a series of events in the run up to the election. Our analysis lends some support to this idea. Although, all things considered, gender played no direct role in interest or following the news, gender did affect electoral turnout, with women more active than men, especially in areas in which women were running for office. The Thomas-Hill hearings boosted political involvement, but only in contexts in which women were running for political office.

Finally, the "Year of the Woman" also referred broadly to the view that gender and gender issues <u>were</u> at issue in the election and campaign. The gender of candidates was news, as was their stand on a number of issues conventionally designated "women's issues." Both major parties, in their own ways, placed the quality of women's and men's lives <u>as</u> women and men on their agendas, at least as talking points. The culture war battles of 1992 were unmistakably about gender and sexuality.

These arguments and campaigns did not create fault lines in public response that ran cleanly between the sexes or even between those with and without feminist consciousness. There was no reason that should have done so. By and large the things that shaped reaction to the candidates -- at least the two major party candidates -- affected men and women in roughly similar ways. Partisanship, despite its long-touted weakening, is a powerful shaper of electoral responses. The Republican emphasis on traditional moralism did help sort out opinion on Clinton and Bush. But we also found that the mix of elements that created male and female responses to the three candidates -- especially Ross Perot -- differed in some respects.

Perhaps the most intriguing aspect of the gender basis of this particular election story is that the key gender-based conflict was not as much between George Bush and Bill

Clinton as it was between Ross Perot and his opponents, and especially George Bush. Here is where we find the cleanest evidence suggesting that gender did indeed make a difference, both directly and indirectly.

Returning from this election to the continuing scholarly issues in gender politics, we emphasize two aspects of this analysis that offer prospects for further research. First, it is important to consider both the direct impact of gender on political orientations and behavior and to continue pursuing the possibility that, at least under certain circumstances, the modes and bases of thinking may reveal gender differences.

Second, and both least explored up to now and most important, we must identify more clearly the circumstances under which gender does come into play in political thinking and action. In our case we have taken one very crude measure of political context -- whether our respondents lived in a district in which a woman was running for governor, the House, or the Senate -- and found that it did make a difference. This can happen, we hypothesize, for two reasons. One is that the presence of a woman made it more likely that certain issues would be raised or strategies used. Many female candidates trying to wrest office from men found it expedient to remind their constituents, and especially the women among them, of the picture of cameras glaring on a woman trying to explain the experience of sexual harassment to an all-male senatorial committee. Another avenue through which context makes a difference is through the symbolic transformation of the setting because of the presence of a woman. It is important to note that the dependent variables we explored concerned the all-male presidential contest, not these races in which women were running. We thus regard these "spillover" effects as worth further exploration.

Reading context into our attempt to understand the role of gender in this particular election has much wider implications. It reflects a growing concern to integrate theories drawn from political psychology with those of institutional politics, getting beyond the purely psychological in attitudinal research (Franklin 199 ; Searing 1991). But just as we have raised questions about the effects of the electoral context on the significance of gender, gender issues, and feminist consciousness on an election, so aspects of the electoral context should affect the role of other groups and issues on elections. Although one might argue that it is considerably easier to study electoral institutions and contexts in multiple simultaneous elections such as House or Senate races (Franklin 1991), it is also true that the contexts of voters in a presidential election in different districts are indeed exposed in many ways to a different electoral context. One only need remember that although in many presidential election years congressional candidates scurry to appear with the person at the "top of the ticket," this is not always the case. Sometimes, as with Republicans in 1992 and Democrats in 1988, the simultaneous races create a very different electoral condition for the presidential candidates. Electoral context should matter.

In an era in which many public commentators and scholars have so over-drawn gender difference it might be tempting to interpret our results to say that gender difference is merely chimerical. This, too, would be a mistake. Much of the exaggeration of gender

difference, we believe, is caused by the fact that our day-to-day sources of information about how the public thinks is drawn from evidence derived from political and cultural elites, including interest group activists and journalists. These people followed hours of Senate hearings and knew, at least vaguely, what the Children's Defense Fund is, and were likely to weave together a conscious interpretation of the election in its relationship to gender and gender issues. But as we know from long years of public opinion research this is not true of the mass public. Add to this the fact that, in reality, gender and sexuality create complicated and even anxiety-producing public issues, and we should be impressed that gender effects emerge as clearly as they do here.

ENDNOTES

We would like to thank Cynthia Bowling for her valuable research assistance. We are grateful to the Institute for Research in the Social Sciences, UNC, for a summer grant that supported Pamela Conover's work on this paper.

1. In all 2,255 were interviewed in both the pre- and post-election waves of the study. Complete study design information is available in Miller, Kinder, Rosenstone and the NES 1993.

2. We discuss this variable further in Conover and Sapiro 1993.

3. Question wording and coding for all variables appears in the Appendix.

4. We also ran the candidate support equations with the Hillary Clinton feeling thermometer. Not surprisingly, warmth toward Hillary makes a moderate but significant positive contribution to explaining support for Bill except among men in all-male contexts. Nevertheless we do not find that contribution of HRC to BC differs significantly between women and men within context, or between contexts among men or women.

"Democracy's Identity in America's Liberal Tradition: Philosophical Views of Ordinary Politicians, 1820-1850"*

Laura J. Scalia
Department of Political Science
UNIVERSITY OF HOUSTON

Abstract

Scholars of our political tradition describe post-constitutional America as essentially liberal. They describe her leaders as committed to the protection of certain private inalienable rights and willing to embrace self government *conditionally*, i.e., provided it protected the fundamental rights of man. In this paper, the author argues that this account of democracy's identity in the liberal tradition only partially reflects the early marriage of inalienable rights and popular sovereignty. She does so by examining the political positions of early nineteenth-century state representatives as they debated the role of popular input in the good society. As is documented herein, these representatives may have agreed private rights deserved great consideration and respect. However, at least for some, the rationale for the inalienability of private concerns also mandated the inalienability of self government. Numerous advocates of democracy revised the state of nature theory and reinterpreted America's original compact so that popular political power derived its value from the same sources as those *private* rights and freedoms good governors were bound to protect. It derived legitimacy from both a Lockean-like theory and earlier American political practices.

"Democracy's Identity in America's Liberal Tradition:
Philosophical Views of Ordinary Politicians, 1820-1850"

Laura J. Scalia
University of Houston

In the past and occasionally today, Americans hail two competing sovereigns: the people and inalienable rights. For the most part scholars of our political tradition agree that the latter ultimately assumed supremacy, both in rhetoric and practice, for by the early 1800s political speeches and laws relegated popular sovereignty to a secondary status, subservient to rights. The people reigned because of and to the extent that they protected rights and freedoms; written laws and carefully crafted institutional checks limited and directed their authority accordingly. As I argue in this paper, this account of democracy's identity in the liberal tradition, embraced by theorists and historians, only partially reflects the early marriage of inalienable rights and popular sovereignty. Yes state builders debating the role of popular input in decision making emphasized the priority of natural rights and limited government. However, as liberal ideology evolved during the first half of the nineteenth century in the United States, numerous advocates of democracy integrated self government directly into their abstract theory of rights. They revised the state of nature theory and reinterpreted America's original compact so that self government derived its identity and value from the same sources as those inalienable rights and freedoms good governors were already bound to protect. It derived legitimacy from both a Lookean-like theory and earlier American political practices. The views of these earlier politicians tell us something about our own misunderstandings regarding liberalism and the American political tradition.

America's Early Views on Good Government: Private and Public Liberty, Liberal and Republican Foundations

Various scholars of our political tradition research and debate the origin and nature of America's commitment to popular rule and private rights. Although some stick to the original Hartz thesis that Americans looked to Locke, unconditionally embracing *private* inalienable rights *only* and denying any inherent merit to active political participation (e.g., Diggins, 1984; Greenstone, 1986; Hofstadter, 1948; Huntington, 1981), a

growing number of scholars admit that, at least for a time, Americans openly praised both public and private liberty, that they relied on other great theorists besides Locke, including thinkers from fourteenth-century Italy and ancient Greece, to form their opinions about ideal government. Some historians compare the political positions of early American state builders to pre-enlightenment republican theorists (e.g., Pocock, 1975: chapter 15). Political pamphlets and letters illustrate revolutionary concern with independence and the avoidance of political enslavement (Bailyn, 1969: chapter 3 and 272-301; Pole, 1969: 531-532). Original state constitutions, which contained powerful popular legislatures, demonstrate political commitment to public liberty and exercised popular virtue (Lutz, 1980:38-48; Nevins, 1969: chapter 4; Main 1973: chapter 5). Rhetoric of Anti-federalists show opposition to the national constitution came not just because it lacked a bill of rights but because it greatly reduced local popular control (Lutz, 1980: chapter 8; Wood, 1969:513-516). Studies from the left and right, of discussion and laws prior to the national constitution, chronicle earlier rhetorical support for *both* private and public liberty.[1] Of course, most of the scholars mentioned above would readily admit that America's infatuation with virtue, independence and activity never perfectly replicated earlier republican theory or practice.[2] Yet many would admit her embrace of popular sovereignty had its origin in traditions distinct from or tangential to liberalism.

For some whether and how much republican ideals influenced early Americans soon became beside the point for by 1787 American leaders spoke less about public freedom from political enslavement and more about private freedom to pursue actions free from arbitrary or excessive government. Liberal ideology soon came to dominate America's intellectual landscape![3]

---

[1] Beside those mentioned above, others who make this case include Appleby (1984: chapter one), Hanson (1985: chapters 1-3), Ketcham (1984: chapters 2-4), and Peters (1978: chapters 1-2)

[2] On this specific issue, see Banning (1986: 3-19) or Rahe (1993: 543-572).

[3] There is some debate concerning when liberal ideology dominated earlier republican ideals. The advocates for the continued importance of republicanism throughout the early nineteenth-century include: Banning, McCoy and Pocock. Those who see its death by the time of the constitution include: Appleby, Pangle and Wood.

What did that mean for the role democracy would play in America's understanding of the good state? According to studies of the time, leaders increasingly discussed the innate tensions between simultaneously embracing private freedoms and popular rule and usually agreed to reduce popular input accordingly (Appleby, 1984; Hofstadter, 1966: 26-30; Pangle, 1988: 117-119; Wood, 1969: 475-499). Certainly changes in fundamental legal documents illustrate an increased skepticism. State constitutions designed in the 1780s contained new complicated checks and balances, aimed at diminishing the direct popular power present in original revolutionary constitutions (Main, 1973: 212-221; Nevins, 1996: chapter 5; Wood, 1969: chapters 10-11). The national constitution contained only one popular branch--the House of Representatives. The Federalist papers contained many "excuses" for limiting popular input and local controls (Beard, 1913: 324-325; Miller, 1988: 100-110; Smith, 1966: 5-9). Even the rhetoric supporting popular input changed. "[T]he American Framers tend[ed] to honor political participation...less as an end and considerably more as a means to the protection of...personal rights" (Pangle, 1988: 53). Seemingly state and national constitution builders rarely spoke about the independent value of popular participation and worried more about the preservation of rights.[4] Whether this shift was a clever avoidance of a delicate political issue (Pangle, 1988: chapter eleven) or a calculated "transform[ation of] the Americans' understanding of politics" (Wood, 1969: 525), this new rhetoric (as described) entailed the theoretical sacrifice of popular sovereignty in the name of rights protection.

Studies of the nineteenth century rhetoric and law support the growing strength of liberal commitments to rights and freedoms. Some scholars note that republican concerns and language still appear on the scene but alongside it exists unabashed commitments to rights and bourgeois individualism (e.g., Banning, 1986; Ketcham, 1984: chapter 5), alongside Whig desire for patriotism and government moral direction lies Democrat emphasis on self interest and private rights (Ashworth, 1983: chapters 1-2; Howe, 1979:18-21, 32-35, 204-205). Government aims became increasing liberal-looking. Jacksonian and Whig economic policies strove to give

---

[4] Also see Diggins (1984: 133-135), Reimer (1967) and Wood (1969: 523-524).

citizens autonomy to pursue their economic fortunes (Hurst, 1956: chapter 1; Meyers, 1957: chapter one, especially 28-30; Wilson, 1987: chapter one, especially 6-11). Constitutions increasingly contained separate declarations of rights (Poore, 1898). And Americans debated popular sovereignty in terms of its ability to protect rights and freedoms, with Jackson and his followers embracing democracy as the best means to prevent corruption and protect liberties and Whigs questioning this connection, believing the art of government required a virtue and patriotism not widespread among the populace (Ashworth, 1983: 10-12, 56-57; Howe, 1980: 81-86, 236; Remini, 1981: chapter two; Welter, 1975: chapter 7). As portrayed here, nineteenth-century rhetoric and law tells the story of a slow but sure emergence of private rights and freedoms as the *raison d'etre* for the American nation and her states. Yes the people ought to rule but mainly to protect America's personal freedoms.[5]

Theorists and historians continue to *suppose* that because Americans talked about self government as the protector of rights, they wholly rejected any independent value for sovereignty and believed only private, individualistic rights formed the theoretical basis of the good state. These assumptions, however, ignore the whole body of historical scholarship that chronicled the influence of republican ideals regarding public liberty on the minds and souls of early American statesmen. They pigeon-hole rhetoric into a particular paradigm, mostly resembling the Locke Machpherson (1962) described. But are these assumptions accurate? Was the language of rights strictly private? Should we not expect America's liberal paradigm to differ from the one created by theorists lacking any prior ideological commitment to the sanctity of popular rule? Is it not more realistic to assume the rise of liberalism included the messy job of finding a prominent place for republican (and for that matter other) ideological components once important to Americans?

---

[5] In addition to the historians listed throughout this section, one can find the same historical account among democratic theorists, most especially those critical of what they describe as the liberal, anti-participatory, democratic tradition (Barber, 1984; Levine, 1981: chapter 1; Macpherson, 1972: chapter 1, especially 5-11; Pateman, 1970: chapter 1, especially 14; Walzer, 1984: 305).

In partial attempt to address these larger questions, I ask a more narrow one: What place did public liberty acquire as liberal ideals conquered American thought? In this paper I argue that early nineteenth-century American statesmen did not wholly ignore earlier independent reverence for popular sovereignty. Although not all politicians struggling to find balance between the sovereignty of the people and their rights would acknowledge them equal partners in the good state, some politicians defied the instrumental passive role most liberal theorists devise for popular rule. Yes nineteenth-century Americans worried first and mainly about the inalienable rights of man. However, for a number of political spokesmen self government was among those important concerns, deriving its merit from the very same origin as other agreed-upon inalienable rights. In this sense American political thought did not follow the simple Lockean path Hartz and company laid out for it. Nor did republican values just disappear. Rather liberal rhetoric subsumed certain aspects of republicanism. In the sections that follow, I present some of this modified view and discuss what it tells us about the liberal tradition in America then and now.

The Data

The first half of the nineteenth century was a time of reform, when state governments became not only more liberal-minded but also more democratic. Prior to 1800 all but a couple of states had taxation or property qualifications for suffrage. Less than half the states directly elected governors or state senators. Nearly all had ad hoc representational schemes more reflective of geographical land masses than population. By 1850 states had lifted all pecuniary qualifications for suffrage. All governors and state senators were popularly elected as were many county judges and sheriffs. A few states now based representation explicitly on the voting population only (Porter, 1918; Williamson, 1960). How could it be that at the very moment politicians supposedly emasculated popular sovereignty of its independent value and made it conditional on its protective abilities, politicians also increased its practical force? To unpack this apparent contradiction I examine political debates surrounding democratic change.

During the first half of the century, Americans repeatedly convened to revise laws and procedures outlined in their state constitutions. As

democratic reform--no ordinary legislative matter--was then high on the agenda, constitutional delegates found themselves repeatedly discussing related issues, including (1) how far to extend the suffrage, (2) how to apportion representatives--e.g., how much power to give to property holders or tax payers and (3) whether to popularly elect presently appointed officials, including governors, judges and sheriffs. In this paper I examine ten conventions, each of which contains debates on at least one of these issues: four from the South (Louisiana 1845, North Carolina 1837, Virginia 1829-30 and 1850), three from the North (Massachusetts 1820, New York 1820-21 and 1846(, and three from the West (Iowa 1844 and 1846 and Ohio 1850-51).[6]

State politicians seemingly used these constitutional conventions to debate the ideological foundations of the ideal society, to discuss and reformulate the connections between these abstract ideals and legal practice. There appears to be amazing consistency across conventions regarding what matters in questions of electoral reform. The speeches quoted throughout this paper come from debates over the issues listed above, not from debates over how to revise state rights declarations or limit specific government branches. It is no clever manipulation on my part that I offer so many quotes revering fundamental law, natural rights and liberty. At each convention, delegates discuss democratic reform in terms of the same general issues: (1) the importance of rights and their protection, (2) the character of liberty and (3) the proper limits of good government. They offer numerous unsolicited comments regarding the importance of maintaining a limited government, one that protects inalienable rights, maintains free decision making. Thus these debates offer good data for understanding how early nineteenth-century American statesmen envisioned the relationship among rights, popular rule and the good state.

In this paper I mostly focus on the views of those favoring reform. These delegates (whom I often call "democrats" or "expansionists") argued

---

[6] Even though close to sixty conventions were actually held during the first half of the century, there exist only twenty records of debates, all from 1820 to 1850. For a list of all documentary material relating to state constitutional conventions between 1776 and 1912, see Shearer (1915).

for extending the franchise, reducing the qualifications for elected officers, making representation based on population only, and increasing the number of state officers popularly elected. Often these speakers were members of the Democratic (and earlier Republican) party, but sometimes Whigs (and earlier Federalists) voted with them for reform.[7] Whenever I quote from one of these delegates I follow the quotation with the state and year of the convention, the speaker's name, and (when unclear from context) the issue he is discussing. On occasion, for contrast purposes, I offer the opinions of their opponents who argued to restrict popular sovereignty by maintaining property and taxation requirements for voting and running for office, by minimizing the number of state officers popularly elected, and by weighing property holdings into representation so as to give extra political power to large landlords and/or slave owners. Whenever I quote from one of these delegates I follow the quotation with the state and year of the convention, the speaker's name, and the word "anti" to signify he was among those who desired to restrict popular control. I concentrate on the views of expansionists mostly because they offered views of the good state different from those outlined in present depictions of nineteenth-century American liberalism. Those against reform claimed a subservient role for self government much like the one described in the previous section. Concentrating on their views might illustrate just how destructive it was to relegate popular rule to secondary status (for they *opposed* expanding democracy), but it would primarily reinforce the partial understanding already well documented in historical and theoretical studies of democracy's instrumental identity in the good state. By highlighting the views of their adversaries--the democrats--I can paint America's currently obscure, yet essentially liberal depiction of popular sovereignty's inherent value.

Characterizing America's Liberalism

i. General Agreements on the Rights of Man

A quick glance at the record from any state constitutional convention readily demonstrates the nature of the commitment representatives had to

---

[7] For example, in New York and Ohio, Federalists voted for the enfranchisement of Blacks. For the behavior of New York Federalists, see Fox (1919). On the political positions of liberal Whigs regarding suffrage reform, see Ashworth (1983: 147-170).

liberal-like goals. They did not worry about moral relativism or free sexual expression. These are twentieth-century liberal concerns! Most commonly, delegates worried about preserving, enhancing and protecting certain inalienable rights which constitutional and natural law dictated to be the ends of good government.[8] In some form or another, whether in support of or against the reform issue at hand, over half--close to two-thirds--of the speakers, specifically mention life, liberty, property or security as inalienable rights and/or among the essential aims of good government. In certain states, e.g., Virginia and New York, nearly every speaker designated these aims as important and worthy of serious independent consideration. The whole point of the convention was to create a constitution that "secure[d] the rights of all classes of people" (Massachusetts, 1820; Ward, anti: 254). Delegates gathered "to lay the foundation of a constitution,....to organiz[e departments] ...which control the lives, liberty and property of the people" (P.P Barbour, anti; Virginia 1829-30: 90-91). America's commitment to the inalienable rights of man served as proof of her righteousness. A government limited to these ends was not arbitrary but limited by fundamental written laws as well as the rational laws of nature.

In somewhat under a half the recorded speeches delegates refer to nature, fundamental constitutional law or compact to explain the immutability of rights and liberty. Mostly they reference to all three. In Virginia, Iowa, Massachusetts and Ohio, where constitutions contained declarations referring to the inalienability of life, liberty and property, delegates often reminded each other that fundamental law demanded rights support. Delegates there and in other states also noted the national constitution decreed the unconditional protection of rights.[9] When arguing to maintain a religious

---

[8] A few isolated speakers, always arguing against reform, adamantly proclaim all rights derive legitimacy from convention and nothing more (e.g., Upshur of Virginia). However these same speakers are usually among the most vocal in favor of the intrinsic importance of property and economic freedom. For different interpretations of American's use of nature versus historical precedent in describing the foundations of the good state, see Diggins (1984: 61) and Pocock (1975: 545).

[9] Delegates sometimes debate how to apply article iv, section 2 of the constitution which says "The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States." This debate, widespread in New York, is mostly over the specific right of suffrage. See below.

oath for elected officials, Webster reminds his fellow delegates that "there are certain rights...which the whole people--or the government...--owe to each individual....These rights are stated with sufficient accuracy in the tenth article of the Bill of Rights in this constitution. Each individual in society has a right to be protected by it, in the enjoyment of his life, liberty and property" (Massachusetts, 1820: 161). When Woodbury of Ohio, in an argument to enfranchise blacks, says that "all men are by nature free and independent and have certain inalienable rights, among which are those of enjoying and defending life and liberty, acquiring, possessing and protecting property and seeking and obtaining happiness and safety" (553), he specifically notes he is reciting from his state's constitution. Nicholas, who advocated maintaining a property qualification for voters, reminded his fellow delegates that Virginia's Bill of Rights "speaks of inherent rights of which men, when they enter into society, 'cannot by any compact deprive or divest their posterity.'" The explicit rights therein declared are "the enjoyment of life, liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety" (Virginia 1829-30: 364).[10] References to the constitutional sanctity of rights reminded fellow delegates of the goals they explicitly shared: to construct a new constitution that preserved America's fundamental principles. Because well established, long standing documents supported certain rights so must delegates as they gathered to reform government procedures.

Most commonly, delegates explained the great priority of rights by establishing their connection to nature.[11] "All men must have same natural rights. For the protection of these rights governments are instituted among men" (Ohio, 1850-51; Townshend, pro black and women suffrage: 550). Man "has natural rights: life, liberty, the pursuit of happiness and the means of acquiring and enjoying property" (Virginia, 1829-30; Thompson,

---

[10] Virginia's constitution has much the same declaration as the Ohio constitution which from which Woodbury quotes above.

[11] By some historical accounts of American political thought of the early nineteenth century, referring to nature was the main means for exonerating rights. See Rodgers (1987: chapter three) for a discussion of just how frequently and how prevalent this philosophical conception was during the early nineteenth century.

enfranchise all taxpayers: 412). Saying rights were natural established them as inalienable since legitimate government aimed precisely to perfect nature's inconveniences, i.e., to make rights secure. How often and with how much detail speakers proclaimed rights as natural varies from state to state. Delegates from states in the North and West tend less often to declare openly rights as natural. They usually show their concern with rights indirectly by speaking about the importance of their unqualified protection. They may occasionally use the adjective natural but they rarely explain in detail what that adjective means. Southerners more likely give long speeches about the rights of man, and it is here one finds numerous and detailed references to nature. This is especially the case in Virginia--both at 1829-30 and 1850 convention--where *every* delegate mentioned the inalienable rights of man and nearly all referred to them as rights of nature.

Although this claim of rights as "natural" often stands alone, without explanation, most delegates likely understood the philosophical context of this claim, i.e., that natural rights belonged to man *prior* to the institution of government. Throughout the late eighteenth century, politicians read and quoted from Locke, who offered an extensive state of nature theory (Lutz, 1984; Kramnick, 1990: chapter 6). At the conventions themselves a number of speakers reached back to Locke's hypothetical state of nature to explain the origin of government and why or which rights have (or do not have) inalienable status. Looking specifically at Virginia's 1830 debates over the basis of representation serves as an instructive case. Close to half the delegates there specifically talked about a state of nature, sometimes referring to Locke, often times explicitly describing that hypothetical world prior to the formation of government. Delegates reminded each other that the state's "declaration speaks explicitly of *a priori rights,* which are supposed to exist in a state of nature and are retained by men in society so as to be social rights secured by the social compact" (Virginia, 1829-30; Doddridge, number basis: 83). Man has "certain inherent rights, of which when they enter into a state of society, they cannot by any compact deprive or divest their posterity, namely the enjoyment of life and liberty, with the means of acquiring and *possessing property* and pursuing and obtaining happiness and safety" (Virginia 1829-30; Campbell, number

basis: 119).[12] Delegates occasionally referred to Locke himself as the man who described this world and whose theories American government had put into practice. For example, when speaking against a mixed representation basis, one delegate tells his comrades that the rights enumerated in the Bill of Rights are the "great and sacred truths...of Locke, of Sydney and Milton" (Virginia, 1829-30; Cooke, number basis: 54). Another delegate, who actually did not believe the state of nature in truth ever *really* existed, recalled that the first article of the Bill of Rights, which refers to man's natural freedom and independence, comes from Locke who spoke of "rights in a condition of man which is supposed to have preceded society," a condition "termed the state of nature" (Virginia 1829-30; Johnson, number basis: 261-262). Yet another noted: it is "the insecurity and inconveniences" of the state of nature that "render[s] it of transient duration." This "is a condition in which not Locke only, but all moral and nearly all political writers have supposed men to exist, for the sake of establishing, by the light of reason, his moral as well as his political rights and obligations" (Virginia 1829-30; Mercer, number basis: 193).[13] Certainly in Virginia, delegates were well versed in the state of nature theory.

Although elaborate speeches about the state of nature were less prevalent outside the South, delegates from all states note that people form government to protect rights--natural or otherwise. In addition to those who speak about the state of nature, many discuss state constitutions as social compacts, their own jobs as similar to the very first state builders in nature, after independence and in the "Wild West." In theory men agreed to a social compact when they left nature and joined government. They contracted to protect those inherent rights left insecure in nature as well as to define the boundaries of legitimate government. At every convention, at least a couple of speakers discuss the social compact and the theoretical importance of its content. Sometimes they seemingly mean that first agreement to leave nature.

---

[12] Twelve Virginia delegates referred to a state of nature either by name or by description as in the quotes above.

[13] At this convention, Locke is specifically mentioned in eleven speeches, two of which reject his theories as metaphysical and useless in practical government.

> The great object of civil society is the protection of life, liberty and property of the members and 'to furnish them with the means of enjoying in tranquility their natural rights and the blessings of life,' and those entering into it have a right to agree upon such a system as in their opinion will best promote these great objects....The people of this Commonwealth are a voluntary association. (Massachusetts, 1820; Saltonstall, for maintaining oaths declaring belief in God: 205)

"The very nature of the social compact that all who enter into it surrender a portion of their natural rights, in exchange for...other rights derived from the compact" (Virginia, 1829-30; P.P.Barbour, mixed basis: 91). Other times delegates appear to mean their state's original or present constitution. In theory the compact always has the same aim--to protect rights and define the boundaries of government. Since existing and proposed state constitutions have the same protective and definitional roles, they too are social compacts too. Here as in the past delegates gathered at the convention precisely because the people voted to dissolve existing government and form a new one. Such gatherings were to result in a new agreements, ones that still protected rights and offered boundaries to government power, ones which the people themselves would then accept or reject mainly on that basis. The people called forth delegates to form a "compact of government for the protection of their lives, their liberty and for the security of their property" (Virginia 1829-30; Powell, number basis: 104). "All the rights of Government are founded in the consent of men and that consent is ascertained through the social compact, or in other words, the written constitution" (Virginia, 1829-30; Giles, mixed basis: 237). "We have a government founded on social compact" (New York, 1821; Williams, suffrage extension: 248). In each of these cases, the constitution represents a voluntary union, an agreement to maintain and protect certain inherent rights, which was first formed after independence and continues to serve as the definitional basis of government. Just as originally the people formed the social compact, now the people revise that contract via representatives at conventions and then directly by their vote. All the same, revisions must stay true to the intent of the original compact and secure what rightfully belongs to all. In this sense, delegates had a responsibility to ensure the rights of man remained secure under each and every new constitutional provision they constructed.

These snippets exemplify a repeated theme articulated at state conventions. Constitutional delegates must heed the inalienable rights nature and fundamental law dictate. Because originally men agreed to form government precisely to protect these rights, good legal provisions (like American state constitutions) must be constructed with this in mind. Such arguments surrounding the origin and nature of good government are quite familiar: they resemble arguments from early liberal philosophers, most especially Locke. Nineteenth-century politicians may have no longer read him and other liberal theorists with meticulous care, but delegates at these conventions could and often did borrow from the language of these theorists to establish and legitimate what constituted the fundamental aspects of good government.

Neither side of the reform debate appears to take the inalienable rights of man lightly. These were the foundational aspects of good government, the kinds of things good statesmen always took into account when redesigning governments. However, just what rights were representatives obliged to consider carefully? Delegates on both sides of the debate agreed that the good state enhanced and protected certain inalienable rights, rights which included important *private* concerns such as economic liberty and private property. But was that all? As I discuss in the next section, counter assumption, Americans did not simply parrot Locke and their British ancestors, designing a state mostly equipped to enhance prosperity and economic freedom. Some politicians altered the views of early liberal theorists in important ways.

ii. Disagreements Regarding the Essential Rights of Man

Much of the debate surrounding questions of democratic reform centered on the issue of enhancing and protecting rights. Around three-quarters of the speakers focused on perfecting protection, thus emphasizing the instrumental relationship between private rights and popular rule. Questions addressed included: Were the people good protectorates? If so, which people? How much direct participation was sufficient? Was there such a thing as too much popular input? Over half the speakers also debated the narrow premise underlying the instrumental argument. Here discussion included specifying the fundamental rights and liberties. Questions in this regard included:

Was America's commitment to popular rule of the same importance as her commitment to say property rights? Did founding documents mandate equal political power? Was self government among the inherent rights of nature? The prevalence of these two general issues demonstrates that Americans did in fact struggle to find a place for popular rule within liberal rhetoric. Delegates recognized that laws regulating self government influenced rights and freedoms. The question was how. For some popular rule had only an instrumental role to play, for others the merit and purpose of popular input was far more basic and fundamental. The latter view represents America's unique addition to liberal theory.

Much of what delegates say against reform (whether it be to keep various judiciary and executive officers appointive, to maintain restrictions on who votes and runs for office, to make districts formerly represent property) their positions strongly resemble the skeptical kind our historians and theorists often attribute to the Founders and Whig constitutionalists (see above). For quite a number of those against reform, good government mainly aimed to enhance and protect property; the rights of man do not include political power. Although there exist variations from state to state and among delegates themselves, speakers against reforms mostly discussed economic and property rights, their innate importance or the need for their special security.[14] Property represented permanent interest in the state. People left the state of nature solely and strictly to protect property, thus making it the *main* concern of the original compact and the *priority* of all resulting legitimate governments. The process of acquiring property built good character and virtue. Property holders brought the greatest prosperity to the state. Property holders were the chosen people of God. Restrictions avoided transgressions on this revered right. The masses could not be trusted to sacrifice their personal desires and protect the property of others. Their political activities would conflict with that most basic private right.

Not only do these advocates of restraint recognize tensions between public and private rights, not only do they argue to restrict popular input

---

[14] In Massachusetts, New York, Virginia and Louisiana this is particularly the case.

accordingly, they also legitimize the tradeoff by purporting self government has value only for its protective capacities. In over two-thirds of the speeches *against* greater popular empowerment, delegates referred to the instrumental merit of popular sovereignty. "The right to vote is aventitious. It is resorted to only as a means of securing our natural rights" (New York, 1820-21; Young, anti: 189). Thus insecure circumstances perfectly legitimated restrictions. If expanding popular rule diminished the effectiveness of popular rule, it could not occur. Although "the majority had the right to govern" *in theory,* in order to protect rights, delegates must decide "how they ought to govern, whether any and what limitations ought to be imposed upon their power" (Virginia, 1850; Scott, anti: 350). Rights protection justified provisions, including popular restrictions.

In addition, these delegates denied self government had equal value to inalienable rights of man. In speeches against reform delegates almost never use the word right to describe political power and often deny it has any origin except in government creation. These delegates mostly describe the vote as a *privilege,* as something granted by *convention,* as wholly separate from the main values of the state, values such as those rights and freedoms granted by God, nature, and/or original compact. Again and again speeches against reform most explicitly explain that "the elective privilege was neither a right nor a franchise" (New York, 1821; Judge Platt, anti: 278). Thus, ongoing tensions between the public and private were not intellectual dilemmas. Only rights of the latter kind constituted the basic elements of the good state. Popular political power was the mere instrument of that aim.

In response to the skepticism of their adversaries, expansionists often countered by assuring that expanded popular power was in fact the *best* means to secure the private rights and liberties of the people. Yes when tensions arose, rights violations could occur. However, these violations would be infrequent for the people had sufficient virtue and good will to preserve and protect rights, freedoms and economic liberty. Mostly restrictions had no practical purpose, for the people were not the callous, rights-ignorant tyrants certain statesmen had supposed. If anything restrictions caused

practical harm, for the politically silent had no protection. An individual's voice secured his rights, not his neighbor's, so for expansionists those presently restricted from a voice in government precariously held their rights and freedoms.[15]

Because close to half the speeches in favor of reform aim to quell their adversaries' fears, assuring them the people would serve as good protectorates, one can safely assume expansionists agreed that self government had important instrumental value (at least for those who had the opportunity to exercise it). At the same time this does not say they saw the instrumental value as the main issue at stake. Nor does it verify they agreed with their adversaries that the only rights to be protected were personal rights, most especially property rights. In fact, not a single speaker in favor of increasing popular control called property the most important right or economic freedom the pillar and foundation of the American regime. Yet in every state I examined, a great number of these speakers extolled the independent importance of popular rule.[16] Expanding popular rule would enhance--not a merely protect--fundamental rights. This meant even in the face of possible tension between public sovereignty and particular private rights, the former could not be sacrificed on behalf of the latter.

The scope and extent of such claims vary somewhat from state to state, with articulated positions in the North and West being far more brief and atheoretical than those in the South.[17] Although the approach, forcefulness

---

[15] For a more detailed and extended explanation of the views summarized here see Scalia, 1991: chapters three and four.

[16] Practically every speech in favor of reform contained some inherent independent principled reason to embrace popular sovereignty. I concentrate on only those relating to its connection to inalienable rights and fundamental liberties in order to show the extent to which delegates gave popular rule liberal value as well as to contrast their views with the straightforward liberal arguments of their contemporary adversaries and our modern scholars.

[17] This is due partly to the variation in state rules regarding how long speeches may last (e.g., in Massachusetts delegates could only speak for two minutes at a time) and partly to how recorders chronicled debate discussions. For Iowa, only fragments of the debates remain. In Ohio, New York and Massachusetts, although transcribed speeches exist for each day, sometimes the recorder only briefly summarized the arguments; sometimes he omitted entire speeches since occasionally one speaker refers to another speech not in

and philosophical rigor with which delegates make their case varies from delegate to delegate and from state to state, one always sees a marked difference between the claims of democrats and those against reform. Around two-thirds of the recorded speeches in favor of reform contained at least a couple of sentences describing political power as an essential right. At *each* state convention expansionists made this rights equation to justify suffrage extension, popularly-based representation, direct election of governors, sheriffs and judges. Reforms would expand rights; without reform rights remained constrained. Any proposal excluding certain citizens from running for office was "a restriction on the rights of the people" (Louisiana, 1845; Marigny: 259). In New York nearly every delegate calls suffrage "an inalienable right" (New York, 1821; Clark: 187), "among...the common rights of man (New York, 1846; Bruce: 785). Every delegate speaking in favor of reform at Virginia's 1829-30 convention and three-quarters at her 1850 convention defined questions of suffrage and representation in terms of "the sovereign rights of the people" (Virginia, 1830; Morgan, extension of suffrage: 377). "[Man] has, in my judgment, certain inherent and inalienable rights....Amongst those is the right of a voice in government, to which he is to submit" (Virginia, 1830; Campbell: 388). Two-thirds of Massachusetts delegates speaking in favor of reform saw it as a direct question of rights. Representation by property left certain citizens "deprived of the rights of freemen," for equal representation was one of "the rights of citizens" (Massachusetts, 1820; Austin: 252). "The right of voting was a grand and essential privilege of freemen" (Massachusetts, 1820; Richardson: 253). Unlike those against reform who almost never use the word right to describe political power and almost always deny it has any origin except in government creation, for most expansionists the equation is second nature.[18] Those who deny the inherent nature of popular sovereignty gravely misunderstand America's ideological

---

the journal. In all four states, delegates discussed each issue for five to ten days, with five to twenty delegates speaking each day. In Virginia and Louisiana, the recorder seemingly kept much more careful accounts of daily speeches. For some issues (e.g., whether judges should be popularly elected) delegates discussed issues much as they did in the North and West: for a few days, with a number of speakers daily. For other issues (e.g., the basis of representation), debates continued for months, with some individuals speaking for a two to three days at a time.

[18] Only one or two speeches across conventions could be construed as inconsistent with this equation between political power and other inherent birthrights.

commitments. The inalienable rights do not include *merely* the private rights articulated by their adversaries; they include the essentially human act of political decision making.

In about a third of the speeches favoring reform delegates vividly portray the public nature of the state's inalienable concerns by connecting political power to liberty and its absence to a lowly unhuman existence. "The power to remove, or abolish any governor....is the root and source of all liberty" (Iowa, 1844; Wilson: 308-309). "The question before this convention [the basis of representation] is whether the people of Virginia shall be free. I am told they are free. Social freedom they have....But are they politically free?...No!" (Virginia, 1850; Stanard: 6, end section). The ability to make decisions both in and out of government made individuals essentially human. The power to influence government distinguished American citizens from slaves, animals and machines. The following characterization of why someone cannot give up his right to re-elect governors exemplifies the personal and essential nature of the liberty democrats describe as being denied without reform:

> Can he surrender the right of liberty? If he does, he ceases to be a man--he becomes a mere automaton--not a freeman...but a mere machine turned at the will of he who works the machinery by which he is governed. (Virginia, 1850-51; Hoge, number basis: 171)

Alternatively, take the following excerpts from a speech in favor of extending the franchise:

> [W]hat is this right? It is that of thinking, willing and expressing his will...God has given to man the power of thinking, willing and speaking his will....the exercise of which every man has by nature as good a reason as another. (Virginia, 1829-30; Campbell: 122)

Without the liberty to govern himself, a man lost his status as a free thinker and a free moral agent. He lost his ability to express his will and therefore resembled something less than human.

At least two to three speeches at each convention express the essential human aspect of participating in political decisions by comparing those without power to slaves of the South, individuals who had no private liberty. "Men who have no property [the presently disenfranchised] are put in the situation of slaves in Virginia" (Massachusetts, 1820; Foster, extend

suffrage: 246). "[Nonvoters] are degraded to the condition of slaves, without the right of exercising an opinion of their own" (New York, 1821; Ross, extend suffrage: 246). Denying the vote to the poor is like "placing them on an equality with slaves...denying them the most important privilege of freemen" (Louisiana, 1845; Downs, extend suffrage: 116). Expansionists took a similar position in favor of equal representation. The people losing under the weighted system in Virginia, the Westerners, "are reduced to the miserable and dependent condition of serfs--serfs to the east" (Virginia 1850-51; Smith, population basis: 289). "This thing, property, while possessed, makes you a Sovereign, and the loss of it a slave" (Virginia, 1829-30; Doddridge, white basis: 88). By equating the political condition of the disenfranchised with that of chattel slavery, expansionists vividly captured just how degrading and subhuman restrictions really were.[19] Those without full and equal political voice were no different than those who could not make any private decisions on their own, no better off than those whose economic livelihood depended on the whim of a master. If economic freedom so concerned their adversaries, so should political participation in government, for life without either was slavery plain and simple.

In some sense these arguments greatly resemble the eighteenth-century message of politicians who parroted their republican forefathers and explained that the absence of participation constituted enslavement. However, the views of these nineteenth-century delegates put forward here differ from their eighteenth-century predecessors in two essential ways. First, they talk mostly about individual--not corporate--enslavement. The whole state does not lose independence at the political silence of the poor; only the poor are degraded and enslaved. Earlier more corporate republican rhetoric allowed and encouraged restrictions among who voted. Individuals less capable could and should be sacrificed in the name of the greater whole. Corporate republicanism did not have space for the language of equal participation (Smith, 1985; Shklar, 1991).[20] A second difference between the

---

[19] Shklar (1991: 39-52) discusses the rhetorical power of this frequently used nineteenth-century argument favoring democratic reform.

[20] On the corporate nature of eighteenth century views regarding political slavery see Appleby (1976: 24-26) or Wettergreen (198x).

views of nineteenth-century delegates and their predecessors arises from a study of the context of their speeches.[21] In at least half the speeches describing the disenfranchised as less than human--i.e., enslaved and/or reduced to an automaton--expansionists explicitly explain the origin of that freeman's right. Invariably it had the same origin they and their adversaries agreed legitimated the other essential, inalienable rights of man.

Scattered through the debates, in some states more often than others, democrats explained what made political power an inalienable right of intrinsic merit, beyond government manipulation. For example, at a few conventions expansionists discussed the connection between popular rule and the state of nature. In that pre-governmental state, inhabitants had the power of deciding whether to join together at all. They initially selected the form of regime as well as those who would rule them. Legitimate governments, based on the initial compact, must continually respect the right of sovereignty found in nature. This kind of argument is especially prevalent in Virginia, where at both conventions over a quarter of the speakers favoring reform explained, in detail, the natural origin of political power. To deny people the right to re-elect their governor is "depriving the people of that power that *naturally* belongs to them" (Virginia, 1850; Carlile: 119, emphasis added). "*Qualified voters are the sovereign people and have the right to rule*....From whence is this right of the people derived? It is derived from the law of nature" (Virginia, 1850; Stanard: 7, end section). "Man has an original, inherent Right of Suffrage....He did not derive it from the social compact, for it existed previous to the existence of the compact" (Virginia, 1830; Naylor: 130). These speakers often accompanied such statements with stories about how government originally formed or how it might form today on a desert island or in the wild west. In each case, when left in "nature" to organize a system of rule, not only did all the people initially participate in the decision, they selected a democratic set of procedures which included equal representation and universal male suffrage. In other words, individuals in

---

[21] With a different goal in mind, Ashworth (1983: 30-31) makes a similar case regarding Jacksonian rhetoric.

nature did not give up their directive powers upon entering society. Now since individuals enjoyed the right of self government in nature, originally chose to preserve it in government, and never chose to alter since then, they deserve to have it now. That present government reflected unsanctioned inequities (e.g., giving power only to the propertied) was an unfortunate mutation. Delegates ought now return the constitution to its original compact form.

In the remaining states, one finds a few scattered allusions to the natural origin of popular power. "[T]his right of the people [to popularly elect judges] is...descending to us as one of our sacred birth rights" (Iowa, 1844; Wilson: 301). Nowhere is the argument as prevalent as among Virginians. However, recorder notes from some state journals imply this argument may have been made more frequently than appears in the written record. For example there are no recorded speeches at New York's 1846 convention claiming the vote a right of nature. Yet, a number of those at the convention speaking against reform designed their speeches around refuting what they referred to as the all-too-common claim that the vote was a natural right.[22]

The vast majority of delegates favoring reform grounded the inalienability of equal and meaningful participation in its sanction in fundamental laws (in the bill of rights or constitution of their particular state, in the national constitution and/or in the original Declaration of Independence).[23] In each state, democratic delegates claimed that America's founding documents--both at the state and national level--included everyone's *right* to participate equally in government, and therefore, in reverent recognition of the authority of these documents, they must respect that right as well. In states like New York and Louisiana, state constitutions did not include a specific declaration of the inalienable rights of man. Delegates there and elsewhere referred to the Declaration of Independence and its declarations regarding the equality of rights.

---

[22] For an example of this, see the speeches of Kennedy and Stew against Negro suffrage, which took place at the New York convention, on October 1, 1846.

[23] Only in Massachusetts did less than half the delegates (i.e., one fourth) tie the right to vote with established doctrines in one or more of these fundamental documents.

Exclusions denied the fundamental truth of "that sacred document" the Declaration of Independence, which clearly states *"that all men are created equal" "and that they are endowed by their creator with certain unalienable rights,"* rights which include the vote (New York, 1821; Clark: 186). Delegates from New York also liked referring article iv, section 2, of the national constitution which mandated each state recognize the rights granted citizens by other states. In Iowa, Massachusetts, North Carolina, Ohio and Virginia, debaters mostly relied on the authority of state documents to make their point. "It is asserted in the bill of rights all men are born free and equal... [therefore] a right of voting...belongs to all persons" (Massachusetts, 1820; Baldwin: 255). The Declaration proclaims "that all men are by nature equally free" thus "[t]he Declaration of Rights means numbers only;" it *mandates* representation by population (Virginia, 1830; Doddridge: 88, 89). Unqualified embrace of popular sovereignty was also found in national and state documents. "To deny the right of the people [to elect their judges] is to deny at once, that truth asserted in the Declaration of Independence...asserted in the Bill of Rights that 'all power is inherent in the people'" (Louisiana, 1845; Read: 745). "The whole Bill of Rights [is] a sacred instrument, ...the foundation upon which the whole superstructure of Government should rest." This document sanctions the right of a majority of the population to rule (Virginia, 1830; Moore: 225). In over half of the speeches arguing to expand the *right* of political power, delegates rely on founding documents for underlying supporting principles. These documents do not explicitly say all shall vote, with equal power in representation, for all officials of any consequence. However they do say all deserve equal rights and power lies with the people, which translates into the doctrine that fundamental law protected self government as an intrinsic good and inalienable right.

Arguments in favor of democratic expansion mostly built upon America's rights tradition. Nature and fundamental law gave life, liberty, property, happiness and security revered status. According to expansionists, having a say in political decision making had the same status, not just because without that power one resembled a machine or chattel slave. Like other rights men held the right to self government in nature, and various founding documents noted its inalienability. By virtue of one's commitment to the

rights and freedoms of nature and fundamental law, delegates needed to ensure states protected and enhanced the people's political influence. "Government is, or ought to be instituted, not for the restraint of rights, but for their security and enlargement" and popular rule was one of those rights (Virginia, 1830; Morgan: 377). Sovereignty was an "inalienable right...of which no government can deprive him" (Virginia, 1850; McComas: 197). Man "has...certain inherent and inalienable rights of which he cannot be divested with impunity. Amongst those is the right of a voice in the government" (Virginia, 1830; Campbell: 388). "The right of voting...is a sovereign right, and one of first importance in free Governments" (Virginia, 1830; Morgan: 377). As one of man's fundamental inalienable rights, equal and meaningful political participation could not be rightfully denied any citizen. Yes over the prior fifty years or so individual states had avoided giving self government the same immutable status as other revered rights and freedoms. However, that unfortunate reality did not belittle the fundamental status of popular input. It only showed that work remained to make actual America mirror ideal America.

If one were to read the entire speech of any partial selection offered here, one would find that calls for equality between the right of self government and the other fundamental rights were built into a Lockean-like argument. Democratic delegates sought to specify rights in order to avoid arbitrary government. They used reasoned arguments to discover what constituted the basis of human freedom and then aimed to make sure government enhanced and protected it. Just as Locke and his followers had used the hypothetical state of nature to explain the basis of just government, so did those for and against reform. They too believed the fundamental laws arising from the compact determined the boundaries of legitimate government. The difference between expansionists on the one hand and Locke, his followers and anti-reformers on the other was the former's "special" reading of what nature mandated and the original compact codified. Expansionists described active popular consent not just as a means to avoid injustices but also as an end in itself, one of those rights that the inconveniences of nature threatened, one of those rights that men compacted to keep after the formation of the state, one of those rights just constitutions included as inalienable. Although most interpreters of the

Second Treatise deny any direct democratic aspect therein and would therefore find such early nineteenth-century American interpretations "unLockean," Ashencraft (1977, 1980) would argue that this democratic reading is precisely what Locke intended all along, that other less participatory understandings have been mistaken. Whatever the case, nineteenth-century expansionists used the liberal language and rhetoric of their ancestors to explain why self government was an essential right of man, something just, non-arbitrary government sought to enhance, not restrain. In this sense, public liberty, an innate value of republicanism, became incorporated into liberalism; not as an expendable instrument of the liberal state, but as one of its inalienable rights.

Public Versus Private Liberty:
America's Priorities Then and Now

As noted in the first section of this paper, scholars generally agree that liberalism, complete with its embrace of the inalienable importance of private rights and freedoms, took hold in America just prior to the nineteenth century. They associate this triumph with the demise of classical republicanism, including any independent value for popular sovereignty. The triumph of liberalism meant the people retained their power on condition, depending on whether they could protect the inalienable rights of man. As the previous sections demonstrate, the views of early nineteenth-century American politicians only partially vindicate this interpretation of democracy's identity within the liberal state. Yes by the early 1800s Americans cared greatly about the enhancement and protection of rights, but that did not mean the private triumphed over public. At least for some Americans a commitment to rights meant a commitment to popular sovereignty, for self government was an inalienable right, held in nature and currently sanctioned by fundamental law. Numerous politicians used liberal language to explain the continued importance of earlier republican ideals. This constitutes the main finding of this paper, i.e., that at least one strand of American liberalism included an inherent place for democracy.

What does this finding tell us about American liberalism? Can a philosophy committed to the enhancement and protection of private rights

also incorporate an independent value for public liberty? Are claims to shared commitment pure fiction? For many a skeptical reader today, the rhetorical stance taken by expansionists does not further our understanding of the development of liberalism, not even its particular American incarnation. The views presented in this paper are the scattered observations of state representatives, not careful thinkers who struggled to create a coherent notion of the good state. Liberalism constitutes the embrace of private rights no matter what petty politicians purport.[24] The fact that claiming equal origin and value for both popular sovereignty and private rights did not erase inherent tensions between public and private liberty, between majority rule and private rights, verifies the lack of rigorous thinking behind such orations. One will always have to choose between them! For other skeptics actions not political posturing constitutes true American ideology, and America's actions did not mirror her words.[25] State constitutions included checks and balances that restricted popular power. The existence of such legal restraints seemingly verify America's long term preference for private rights and economic freedom. To agree with with either type of skeptic is to say the above-described positions of nineteenth-century democrats were nothing more than useless rhetoric. I would like to briefly address the assumptions behind these skeptical readings of what constituted nineteenth-century American liberalism.

The liberal tradition has always encompassed ideals which threaten one another. The intrinsic value of any particular right does not arise from its internal consistency with other inalienable concerns. Value emerges from reasoned accounts of what freedoms differentiate humans from lesser species (Peters, 1978: chapter 3). In practice liberal states have valued somewhat conflicting goals, but aim to retain all as equal partners. For example, no one doubts the free market occasionally infringes upon the sacredness of life, as it does in dangerous yet essential industries. We permit workers in coal mines to confront life threatening conditions, long-term respiratory illness, etc., in great part because we deem coal

---

[24] For a telling example of the consequences of this position see Levine (1981: 125-126).

[25] See for example the debate between say Diggins (1984: chapter 1) and Wood (1966).

excavation necessary for America's industrial survival. The need for coal takes precedence over the life expectancy of individual miners. Here market mechanisms prevail and workers receive high compensation for their risks. Other times however the sanctity of life triumphs as it does in each decision to reduce pollution or avoid some environmental destruction despite the burden restriction places on jobs and market competition. Perhaps the most contentious struggle today centers around the tradeoff between the liberty of a pregnant woman and the life of her fetus. Theorists and politicians may find such tensions disturbing and troublesome but in recognition of shared commitments, they continue to balance them and seek case by case practical resolutions.[26] Conflicts do not lead "good" liberals to automatically give one right, say life, consistent secondary status among the rest. Each concern is deemed fundamental to the good state, part of a whole package--the liberal value system of inalienable rights passed down through America's intellectual forefathers and her political practices. (We no longer speak of the state of nature!) Theorists and politicians thus resolve conflicts by balancing, not by relegating some rights to permanent secondary status. The tradition of liberalism has always been a tradition of diverse ideals. Why should the addition of self government as another sometimes conflicting addition be a special case?

Expansionists asked this precise question of their adversaries. How could rights-minded Americans ever think of deserting the priority of self government? Although not discussed in great detail above, democratic delegates recognized popular rule might infringe upon private rights.[27] However they refused to bargain away the independent, inherent value of the right of self government. Those who would give political participation in government secondary status among a list of concerns (whose legitimacy originated from the same place) blatantly misunderstood the American tradition. There existed certain inalienable rights which defined one's

---

[26] Sometimes tensions are even inherent in a particular right. The state secures freedom to practice the religion of one's choice. Yet one cannot freely practice one's religion in public schools or their recreation centers precisely because of the separation of church and state the original freedom implies.

[27] On their explicit views regarding the tensions between majorities and minorities, see Scalia (1993).

humanity. Reason, history and fundamental law--not expected internal consistency--determined that list. As self government was on "the list," expansionists could not prioritize and reject it at the first sign of tension. This may seem like a simple semantic ploy, but how is their position any different from why liberals today embrace life, liberty and property despite inherent tensions among them? How is balancing self government as an equal partner with these other rights any different from the way politicians currently resolve conflicts among *private* rights and freedoms?

Some might say the difference lies in Americans political responses, i.e., in her actions toward perceived tensions. Since 1787 politicians have fought for and maintained categoric restrictions on popular political rule. Certainly nineteenth-century practice still retained many restraints on popular power. At each constitutional convention discussed above, reforms flourished *alongside* continued restraints. Qualified black suffrage accompanied white universal suffrage. Sheriffs became popularly elected while most judges remained appointive. Some states created legislative districts according to the voting population; many explicitly made property the basis of representation. The people ruled more freely in some areas, less in others. Perhaps that means the majority of convention delegates did not buy the logic behind the arguments described in the previous section. However that does not mean those who equated political participation with the inalienable rights of man did so just for rhetorical effect. Nor does it imply each and every restriction on popular power represents yet another explicit denial of its inherent worth. Restraints may simply represent *practical* considerations, attempts to balance the delicate relationship between liberty and license, something liberal theorists and politicians have long tried to do with each private right as well.

The history of liberalism has always included the expansion of rights alongside appropriate restrictions. John Milton wanted freedom of the press but he expected morality and religion to set explicit boundaries.[28] Even John Stuart Mill, the great spokesman for much permissiveness, set limits to private liberty. He spoke of a harm principle which allowed free enjoyment

[28] See his argument in *Areopagitica*.

of individual rights only to the extent actors never harmed the rights and freedoms of others. Milton, Mill and most every pre-twentieth century writer on behalf of rights expansion recognized the difference between liberty and licence and admitted that restraints--albeit ones minimizing resultant rights violations--must limit behavior to avoid potential harms. American law and practice reflect this understanding and include explicit restraints on private rights precisely in order to protect them. For example, during at least the first century of independence, freedom of conscience mostly meant freedom to chose which religion to practice, not freedom to be an atheist. Americans then considered atheists unable to follow laws and likely to harm neighbors. As Locke had advised, they restricted free conscience to protect public order.[29] The same caveat still restrains freedom of speech. Speech that may physically harm another does not enjoy constitutional sanction. Whether inherent in the theory of why we left nature or documented in our written laws or part of our general tradition, all private rights have limits. Qualified rights are not thereby secondary to some grand state plan which gives other rights theoretical supremacy. Restrictions simply acknowledge the fine line between license and liberty, between my rights and my responsibility toward others' rights. Any privilege granted to a person by virtue of his humanity belongs to all, but by virtue of its shared status, explicit rules must accompany its use. Thus the question arises whether restrictions on political power should be categorized any differently from legal restraints on other rights? Early nineteenth-century politicians in favor of reform thought not. By restraining self government you restrained liberty. To call it otherwise obscured the gravity of such actions.

Put together, the above suggests that nineteenth-century calls to incorporate self government among the inalienable rights offered no special tensions or inconsistences. Liberalism has always been a package of values at odds with one another. Does that mean there exists the potential to revive this forgotten view and recreate an independent liberal value for self government? Let me close by saying the kind of world view which could have maintained self government as a right continues to fade from our

---

[29] See his *Letter Concerning Toleration.*

liberal identity. Amid our current rhetoric regarding individual rights, we speak more of entitlements and less of responsibilities. Clearly, *unrestrained* self government can never be practically implemented given America's commitment to other rights and freedoms, for popular rule forever requires some sacrifice and restraint in its exercise. *The right of self government is a great responsibility.* To the extent we no longer applaud rights which entail such restraint, self government can never sit comfortably within today's liberal rights entitlement rhetoric. This means the nineteenth-century view outlined in this paper will likely remain just that: a nineteenth-century view!

Scapegoats or Sacred Cows?
Anti-Party Critiques in Germany

Susan E. Scarrow

Scapegoats or Sacred Cows?
Anti-Party Critiques in Germany

Susan E. Scarrow

The question about the fate of democracy in Germany is therefore implicitly and above all a question of the relationship of the German people to their parties. The discontent with politics and democracy which is so widespread in Germany, and about which people recurrently complain, is first and foremost discontent with the political parties.

-- Karl Friedrich Kindler, 1958

Thirty-five years after it was written, Kindler's diagnosis about German discontent with political parties still sounds fresh, even if this discontent no longer seems to pose an immediate threat to German democracy. Anti-party arguments have played a recurrent role in German political life ever since the mid-nineteenth century, when political parties began to organize in legislatures throughout Germany. Despite the success of the parliamentary democracy that emerged after 1945 in the western part of Germany, even this so-called "party state" [Parteienstaat] has been haunted by ambivalence towards the very parties which are granted special status in the country's Basic Law. This ambivalence has again come to the fore in (re)united Germany, as the country once again faces serious questions about the effectiveness and desirability of particular democratic institutions. In the 1990s, opinion polls and electoral behavior seemingly revealed growing alienation of Germans from their party system and from their party state. As a result, German political analysts have been heatedly debating the causes of the growth of popular Parteienverdrossenheit (vexation with parties). But while Germany in the past 120 years provides rich opportunities for observing the interplay between attitudes towards political parties and attempts to stabilize (or destabilize) the political system, neither in the 1990s nor in the past have Germans been alone in their disenchantment with political parties.

Italy's recent popular revolt against established parties reached a new high in the spring of 1993, when 90% of voters (69% of the electorate) voted to abolish state subsidies for political parties, and when the new "movements" (self-proclaimed anti-parties) registered strong support in local government elections (Graham). In the same season, French voters showed their lack of enthusiasm for traditional party alternatives by casting 2.1 million spoiled ballots in the March 1992 parliamentary elections (three to seven times as many as in recent elections) (Davidson). Meanwhile, the surprising story of the US presidential race in 1992 was the mobilizational ability of the non-party candidate, Ross Perot.

This list, not meant to be exhaustive, suggests that the contemporary success of anti-

party appeals is not confined to a single country--something that should come as no surprise in an era where other political ideas (Eurocommunism, Ecology parties) have routinely transcended national borders. Nor is there anything new about anti-party appeals outside of Germany. Anti-party populism has a long pedigree in the United States: since the foundation of the first American republic, US politicians and scholars have tended "to deal uneasily with the necessities of partisan political organization because of their widespread belief that political parties are, at best, unavoidable evils whose propensities for divisiveness, oligarchy, and corruption must be closely watched and sternly controlled" (Ranney, 22; Skrownek). And American unease with partisan political organization was itself inherited from British political experiences (Hofstadter).

Yet despite the recurrence and reach of anti-party appeals, few scholars have attempted to provide either cross-national or cross-temporal perspectives on the nature and consequences of charges levelled at political parties. Perhaps because most European and American political scientists in the past half century have themselves been firmly committed to "multi-party democracy", there have been relatively few attempts to dissect either the sources, or the implications, of dissatisfaction with existing multiparty systems. Yet both types of analysis are necessary if we are to gain a better understanding of anti-party phenomena.

Anti-party sentiment can fruitfully be studied at both the mass and the elite level. On the one hand, anti-party sentiment can be viewed as an aspect of mass public opinion. Studies that start from this perspective describe the dimensions and possible causes of popular anti-party attitudes in one or more countries (for instance, Abromeit; Berger; Lawson and Merkl). On the other hand, anti-party sentiment can be studied as an aspect of elite debates about the desirable shape of the political system. Within this second context, anti-party sentiment can be viewed as a mobilizational appeal, as a weapon used by those endorsing political change. Studies that start from the second perspective, like the one presented here, examine the link between elite debates and system changes--changes that may occur whether or not studies of the first sort actually uncover evidence of widespread popular discontent with existing parties or party-based institutions.

The question explored in this paper is, "what kind of system change(s) does anti-party sentiment promote?". This paper argues that part of the answer to this question lies in the ways in which opinion-forming elites frame debates about the "problem(s) of parties". Political elites channel, amplify and even increase discontent with political parties by bringing specific charges against parties and their roles in the political system. The ways in which

anti-party arguments are framed provide clues about the type of changes which may result from particular waves of anti-party populism.

The Problem(s) With Parties: Diagnoses and Cures

There have been only a handful of systematic considerations of the nature and probable consequences of specific varieties of anti-party criticisms. In his study of two centuries of efforts to reform American political parties, Austin Ranney divided party critics into two categories: Abolitionists, who wanted to rid the Republic of the divisive influence of political parties; and Reformers, who wanted actual parties to more closely approximate various ideals of parties as they should be.[1] These labels point to important strands of party criticism, but Ranney did not attempt to precisely define these categories, nor did he aspire to provide a framework for the comparative study of party criticism.[2] In a 1970s discussion of British politics, the comparativist Jean Blondel listed three primary charges against Western European political parties: that they have oligarchical organization, that their leaders squabble among themselves, and that they cannot act decisively when in government (Blondel, 7). While this list is less comprehensive than Ranney's, it does usefully specify types of anti-party criticism in a way that points to proposed solutions attached to these charges.

The best guidance in the search for a vocabulary for analyzing elite anti-party arguments comes from a recent article by Hans Daalder. In his examination of scholarly attitudes towards political parties, Daalder suggests four broad categories of party criticism: "the denial of party" (all parties are a danger to society); "the selective rejection of party" (some parties are good, others are bad); "the selective rejection of party systems" (some party systems are bad); and "the redundancy of parties" (parties are being supplanted by other institutions and actors). Daalder's intent in detailing these different "bodies of thought" is to demand a recognition of the normative assumptions that often underlie

---

[1] His third category is Defenders, who responded to such attacks by emphasizing parties' virtuous functions.

[2] Ranney implied that cross-national studies are unlikely to shed much light on the subject of American party reform, asserting that, "[f]rom our national beginnings, America's political and intellectual leaders have had a good deal more to say than their counterparts in other lands about the proper role and organization of parties," and "[t]he extensive changes made in the historic course of American party reform add up to a volume of reform far greater than in any other Western nation" (Ranney, 30, 20).

political science discussions of the "role of party in European systems". However, the perspectives described by Daalder have played a more general role in academic and popular debates about party roles inside and outside Europe. Daalder's perspectives can be more parsimoniously condensed into three varieties of anti-party arguments. Each of these arguments carries with it distinct implications about the best remedies for the perceived problems of party democracy. These criticisms, and their implied solutions, can be briefly summarized as follows:

1) **Functional Critiques** Parties or party systems exhibiting certain (ideologically neutral) characteristics endanger the proper operation of political institutions. Those making functionalist (system effectiveness) arguments, like Ranney's Reformers, accept that parties play a vital role in the polity, but want to tinker with the rules affecting the operation of all parties within the political system. Such arguments may lead, for example, to proposals to change parties' internal constitutions, or to proposals to modify election rules.

2) **Programmatic Critiques** National welfare can only be guaranteed by offering voters the proper spectrum of party alternatives: parties advocating (or failing to advocate) certain goals or methods endanger the polity. Those making arguments of this type focus on the danger posed by the presence or absence of <u>particular</u> parties (existing or imaginable). They may propose such protective measures as the prohibition of specific parties, or they may advocate the introduction of new parties to better represent the interests of society.

3) **Systemic Critiques** Most or all parties, by their very nature, endanger a political system's legitimacy and/or its healthy operation: multiple parties are a disease which threaten the body politic, and they need to be isolated or even eliminated. Those making arguments of this type seek fundamental changes in the links between the governed and the governors. They want to reduce the decision-making power of political parties, whether by outlawing all parties (or all except a single party), by introducing non-partisan elections (for instance, at the local government level), by using more direct democracy techniques (such as initiatives and referenda), or by expanding non-partisan representation.

This paper posits that each of the three types of anti-party critique is closely identified with a specific genre of remedy, as Figure 1 suggests. If each political system can be thought of as a type of game, possessing an identifiable set of players and rules, then these three varieties of proposed remedies for party problems can be classified according to the way they would affect the political game: by modifying the rules affecting all players; by changing the cast of players; or by fundamentally altering the game itself.

FIGURE 1
ANTI-PARTY DIAGNOSES AND ASSOCIATED CURES

Diagnosis of Problem(s)	Nature of Proposed Cure
I. FUNCTIONAL	**CHANGING THE RULES:** -changes affect all parties -emphasis on rule neutrality Examples: reform electoral system & party finance laws.
II. PROGRAMMATIC	**CHANGING THE PLAYERS:** -change specific parties Examples: ban anti-system parties; found new parties.
III. SYSTEMIC	**CHANGING THE GAME:** -change the arena in which all parties operate Examples: expand direct democracy; increase non-party representation.

Figure I suggests that "cures" endorsed by the systemic critiques are likely to be the most wide-ranging, fundamentally affecting the roles of all parties in the political system. It also implies that those seeking to overturn democratic institutions are most likely to attack multi-party systems with Type III arguments. But what Figure 1 does <u>not</u> imply is that all systemic arguments inevitably lead to the endorsement of anti-democratic remedies. There are great variations in the scope of party roles in specific multi-party democracies. Type III arguments may lead to calls for the introduction of one-party dictatorship, but they may also be invoked in favor of changes which would retain a democratic framework while reducing the scope of the party state (for instance, by expanding direct democracy). It is worth underlining this point at the outset, because inside Germany and elsewhere, many modern critics have invoked systemic arguments with the proclaimed aim of reducing the mediating influence of political parties (whether by establishing direct primaries for candidate selection, by increasing the use of referenda, or by "town-hall" democracy). Arguments can and will

be made against such anti-party proposals: they favor those with wealthy supporters, they over-simplify complex policy issues, they incapacitate the ability of elected officials to govern, etc. These are reasonable grounds on which to argue about such proposals. However, it is wise to reject the polemically powerful, but logically fallacious, "sacred cow" approach which presumes that all who now make systemic anti-party appeals should be automatically equated with their undeniably anti-democratic counterparts from the 1920s.

Furthermore, Type III arguments are not the only kind that can be used to endorse arguably undemocratic "cures" (such as outlawing parties which call for deep changes in the social or political order). Indeed, the range of solutions endorsed by each type of argument may vary widely from clearly democratic to unquestionably anti-democratic. And, of course, to say that a solution is democratic is not to say that it is politically neutral: most proposed reforms would unequally affect the existing party alternatives.

Although this framework may not help us sort out the democratic "sheep" from the anti-democratic "goats", its categories do make it easier to assess both the continuity, and the probable consequences, of anti-party attacks. The following sections of this paper show two ways in which such a framework could be used. In the first section, a discussion of recurrent anti-party arguments in Germany is intended to clarify the categories proposed above, as well as to provide an historical context for the contemporary German debate about the "problems with parties". This contemporary debate will be considered in the second section, which will use the proposed categories to assess the likely outcome of today's wave of anti-party sentiment.

Varieties of Anti-Party Criticism in Germany

Functional Critiques

Functional arguments charge that parties with certain characteristics are likely to endanger the stability, effectiveness, or legitimacy of the political system. Two specific types of functional anti-party criticisms have surfaced repeatedly in German political debates: one type has focussed on the size of parties' parliamentary delegations, while the other type has focussed on parties' internal organization.

Though small parties were a feature of the imperial German parliament, functionalist attacks on small political parties only became common in Germany after proportional representation was introduced in 1918. However, since the 1920s criticism of small parties has been a recurrent theme, one that has been closely linked with electoral system debates.

Functionalist critics charge that small parliamentary parties endanger the efficient functioning of the polity because they foster unstable coalitions. Furthermore, such critics claim that small parties endanger the legitimacy of the entire parliamentary system because small coalition partners are disproportionately powerful.

The introduction of proportional representation in 1918 Germany was a change which was widely supported by German politicians and political observers (Schanbacher, 47 ff). In the 1919 National Assembly deliberations on a new German constitution, the overriding virtues of proportionality were almost taken for granted.[3] The Liberal delegate Friedrich Naumann raised a lone voice in committee debates when he invoked the specter of small parties crippling the future parliamentary system. Naumann, who with hindsight looks remarkably like a German Cassandra, opposed enshrining proportional representation in the new constitution because he expected that such a system would produce parliaments without stable governing majorities (Schanbacher, 76).

Although Naumann himself died shortly after this debate, other voices soon adopted his argument that small parties threatened the democratic system. Like Naumann, these critics viewed the electoral system as the prime weapon for combatting the proliferation of small parliamentary parties. While the Weimar constitution stipulated that all German elections must use proportional representation, those making functionalist anti-party arguments hoped that they could legally modify existing proportional representation electoral systems to eliminate the smallest of political parties. In several state parliaments functionalist critics won support for electoral law modifications which were supposed to increase government effectiveness by hindering the parliamentary participation of very small parties. Influenced by such arguments, the state parliaments of Mecklenburg, Hamburg, Hessen, Baden, and Saxony introduced relatively large, forfeitable, deposits for all parties appearing on the ballot[4], and the legislatures in Prussia, Bavaria, and Württemberg modified the rules by which seats were allocated--to the detriment of small, geographically dispersed, parties.[5]

---

[3] Delegates to this Assembly were elected by proportional representation.

[4] The deposit was to be forfeited by parties which did not succeed in winning at least one mandate.

[5] 11 attempts at state-level modification of the PR system were overturned as unconstitutional between 1927 and 1930 by the Staatsgerichtshof (Apelt, 182). For a detailed account of Land and Reichstag debates about electoral reform, see Schanbacher.

After 1945, German politicians and scholars almost unanimously agreed that the proliferation of small parties in the Weimar parliaments had contributed to the demise of the first German republic. The emigre scholar F.A. Hermens was already campaigning in the 1930s for recognition of the ill-effects of pure proportional representation. In an impassioned text that was widely cited in postwar Germany, Hermens argued that "P.R. facilitates--and thereby creates--a multiplication of parties," (Hermens, 16) and he lauded "[t]he Majority system [i.e., single member district system] as the protection of democracy and national unity".[6]

Arguments about the destabilizing effects of small parties helped ensure that most of the new Land constitutions opted for state electoral systems designed to exclude very small parties. While delegates to the Parliamentary Council in 1948/49disagreed about the format of the desired federal electoral system, they all agreed that any system should deliberately exclude very tiny parties from the new parliament.[7] The electoral system debate in the Parliamentary Council ended inconclusively: instead of anchoring the choice of electoral system in the provisional constitution, the framers of the Basic Law left this decision to future legislatures. As a result, debates about electoral system reform continued through the 1950s and 1960s. Proponents of the adoption of a more British-style electoral system repeatedly returned to functionalist attacks on small parties, arguing that so-called majority systems would protect the country from the dangers of party system fragmentation. Thus, for example, in the 1960s an electoral law commission appointed by the pro-reform CDU interior minister criticized PR voting because, "Proportional representation facilitates the division of parties. It eases the creation and growth of radical parties" (Lücke, 94). Furthermore, the commission wrote, the existence of small parties undermines democratic legitimacy because where there are small parties, there are usually coalition governments--and with coalition governments "there is no unmediated influence of voters on the formation of the government" and "the contrast between government and opposition is not clearly defined" (Lücke, 94). In the same years both CDU/CSUand SPD commissions used similar arguments to endorse the abandonment or radical modification of Germany's proportional representation electoral system (Lücke, 164-170).

---

[6] A section title from his book, Democracy or Anarchy?.

[7] The SPD, FDP, and KPD endorsed a proportional representation system with a "hurdle" to automatically exclude small parties, while CDU/CSUdelegates favored the single-member district plurality system.

Thus, one common type of functional attack--on size characteristics of parliamentary parties--has repeatedly led to calls to change electoral system rules. The second common type of functional anti-party argument focusses on the characteristics of parties' extra-parliamentary organizations. Such critiques describe ways that "bad" internal organization can impair parties' ability to act decisively and/or democratically. The solutions suggested by these arguments have aimed to change the rules which directly affect all party organizations. Such arguments have been particularly strong in the Bonn Republic.

Since the mid-1950s Germans have held ongoing debates about whether the sources of party funds can impair the ability of parties to fairly represent their electorates. On the one hand, each time parliaments have changed the size or format of state subsidies to political parties, critics have railed against the politically-insulated, "self-service" party machines. On the other hand, each time political funding scandals have been uncovered, critics have lamented the unequal access of rich donors to party representation. In both cases, functionalist arguments about impaired party democracy have supported calls for changes in the rules on how all parties are financed, and in the extent to which all must reveal their funding sources.

Another common sort of functionalist criticism in the Bonn Republic has focussed on parties' internal rules. Such arguments accept the premise that parties without formally democratic constitutions cannot be trusted to support a democratic political order. As a result of such arguments, Article 21 of the 1949 Basic Law, which gave West German political parties constitutional status, also stipulated that parties must have democratic internal organization. Although the exact meaning of this was supposed to be spelled out in legislation, a full decade passed before a government made the first (unsuccessful) attempt to pass a Parties Law clarifying the definition and duties of political parties. In parliamentary discussions of the 1959 draft legislation on parties, the interior minister Gerhard Schröder made clear that the law's stipulations about internal party organization were a response to functionalist anti-party critiques:

> The provisions about internal party organization have two aims. The first has to do with protecting against the re-awakening of totalitarian parties. The second has to do with insuring indubitably democratic parties against the erosion of broad-based decision making caused by the construction of overpowerful party oligarchies (Deutscher Bundestag, 5631).[8]

---

[8] A similar version of this law finally passed the parliament in 1967. This law, still in effect, specifies that a political party is only legally recognized as such if it selects party

The examples in this section have illustrated how functional anti-party arguments in Germany have been linked to calls for rule modification. Though some of the proposed changes have obviously been designed to eliminate specific small parties, they have been presented under the guise of neutrality towards all parties: they are concerned with organizational forms, not with political content. Those making functional criticisms have argued for incremental modifications to the political system, not for replacement or radical redesign.

Programmatic Critiques

The second type of anti-party critique distinguishes between desirable parties and those which endanger national welfare. Among those arguing that it is necessary to change the roster of party players in order to improve the political game, some may want to eliminate certain players, while others may want to expand the list of players. In particular, some may want to exclude from play "anti-system" parties, parties which can be identified by the ideologies they promote and/or by the methods they endorse. (Arguments of this type may be used to defend the existing political order, democratic or otherwise.) Alternately, others may argue that it is necessary to expand or modify existing political alternatives in order to guarantee national welfare. This second type of argument can be invoked to promote radical programmatic reform of existing parties, or to endorse the establishment of new parties with non-traditional goals and/or methods.

Programmatic anti-party attacks have a long German pedigree. Within the first decade of German unity, and only two decades after the appearance of extra-parliamentary parties in the German states, Bismarck invoked the preservation of national welfare to justify his attacks on two ideologically dissimilar parties, the Catholic Center Party (Zentrum) and the German Social Democratic Party (SPD). For instance, in Bismarck's successful call for anti-socialist laws in 1878 he described the SPD and its supporters as a danger to the state "because of their political and economic goals and because of their 'general attitude of scorn towards every law and custom'" (quoted in Pack, 84). Bismarck's Sozialistengesetz--like his Kulturkampf measures--aimed to strangle all interelection social and political activity which might serve to promote the electoral success of either the SPD or Center Party. The solutions adopted in the 1870s and 1880s were directed at extra-parliamentary activity: both

---

leaders and candidates for public office using democratic (either direct or representative) procedures.

SPD and Center Party candidates continued to participate in elections even when all other party organizational activity was banned.

Weimar politicians feared a repetition of Bismarck's Sozialistengesetz. Thus, many were reluctant to adopt the argument that the state had a right to take special measures to protect itself from parties whose proclaimed aims endangered the political order. However, as public order was increasingly threatened by opponents of the new regime, the national government and some state governments used the provisions of the 1922 Law for the Protection of the Reich (originally directed against non-party clubs and associations) to ban the activities of those parties declared to be enemies of the regime (Jasper, 142). Even in this context of persistent attacks on the democratic system, both government ministers and the Weimar high court agreed that there were constitutional limits on how far the state could go to protect itself from unfriendly parties: thus, parties whose intra-election activies were banned in the 1920s were not prevented from competing normally in elections (for instance, Reichskanzler Marr, Deutscher Reichstag 1924).

Programmatic anti-party arguments became much more palatable to German politicians after the Second World War. For politicians in occupied Germany the turmoil and ultimate collapse of the Weimar system were fresh memories, while the Sozialistengesetz was something from history books. Because of the experiences of Weimar, the framers of the Grundgesetz empowered the new constitutional court to ban parties which, "according to their aims or according to the behavior of their members, seek to impair or to abolish the liberal democratic fundamental order, or which seek to endanger the existence of the Federal Republic of Germany" (Basic Law, Article 21). The solution chosen by the framers of the Basic Law was more direct than Bismarck's solution: the Grundgesetz provides for completely outlawing parties, and for excluding banned parties from electoral competition. This was an uncontroversial measure which prompted little debate in the Parliamentary Council Support for such a measure is indicative of the still widely accepted idea of the Federal Republic as a democracy which can actively defend itself from hostile forces--even from enemies who use party organization as a Trojan Horse strategy for attacking the polity (as a streitbare Demokratie) (Backes and Jesse).

In several periods in the Federal Republic programmatic anti-party arguments have been directed against specific parties. Thus, in the early 1950s, Konrad Adenauer's government successfully appealed to the Constitutional Court to ban the Communist Party (KPD) on the grounds that this party sought to overthrow the West German parliamentary system. While the KPD was the only party to be banned in the Federal Republic between

1956 and 1992, programmatic anti-party arguments against other parties were not absent in this period. Indeed, such arguments have re-emerged in the Federal Republic of Germany whenever parties of the far right have demonstrated significant local or state-wide electoral support.

In the mid-1960s, when the German Nationalist Party (NPD) racked up a string of victories in state elections, some demanded that the political system should protect itself by banning this party. Similar calls were made in the mid-1980s and early 1990s, when electoral support for right-wing Republicans and German People's Party (DVP) was on the rise. Finally, in 1992 and 1993 the Office for Protection of the Constitution successfully applied to the constitutional court to ban several very tiny parties of the extreme right. Because the ideas associated with these tiny parties are widely condemned as unacceptable by Germany's political class, few Germans have challenged the solution that follows from the programmatic anti-party argument: that some parties' ideas are so harmful that it is best for the political system to remove them from competition.[9]

The other side of the programmatic argument is the claim that national welfare suffers because of the absence of certain programmatic alternatives. Those making this type of argument advocate the expansion of the political spectrum, whether through the radical modification of existing parties' programmes, or through the creation of new parties. Party reformers and party rebels are among those most likely to criticize the existing electoral alternatives, whether on the left, the right, or in the middle. In endorsing calls for programmatic or procedural changes, they make claims about what the voters want to be offered. Such arguments can be made in support of supposedly radical programmatic changes (such as the SPD's Godesberg Programme in 1959) or to support sudden leadership changes. In the late 1970s and early 1980s, arguments about the need for new political alternatives were made in support of the emergent Greens party.

As the examples in this section have shown, programmatic critiques eschew any pretence at neutrality. They are made by avowed partisans who invoke basic ideals as guides for the entire political system, and who advocate alterations in the list of party alternatives in order to ensure that these ideals triumph. Germans who have used such arguments have usually been defenders of multi-party politics; they have insisted, however, that multi-party politics can only be successful if voters are offered appropriate choices.

---

[9] However, Germans have been much more reluctant to use such measures against the politically distasteful, but electorally successful, Republicans (Financial Times, 2).

Systemic Critiques

The third type of anti-party argument more universally indicts political parties and the political systems in which they operate. According to such arguments, multiparty systems can endanger public welfare by undermining support for the polity, and/or by incapacitating the system. Ever since the emergence of organized parties in German legislatures, several varieties of systemic anti-party arguments have regularly resurfaced in this country. Solutions linked to this type of argument vary greatly in degrees of extremity, but they all start from the premise that there is a need to fundamentally overhaul the political system.

One variety of systemic anti-party argument claims that a system's political legitimacy is threatened because its parties do not represent (and may not even know) the will of the people. According to such charges, partisan office holders are more concerned about pleasing party bosses than about representing voters; as a result, bonds between citizens and their government are eroded. The fear that party politicians hurt the political system was widespread even before the original German unification. Many 19th century Germans who feared political parties argued that the proper roles of legislators was to put the good of the nation above the good of particular geographic or partisan segments. To ensure that legislators would not be unwillingly bound by special interest, German constitutions from the North German confederation onward explicitly freed legislators from parliamentary party discipline (Fraktionszwang) (Milatz, 11). Bismarck and other non-socialists used similar arguments to oppose the introduction of salaries for Reichstag deputies, claiming that only a non-paid parliament would attract selfless and idealistic legislators (Hamerow, 295; Pflanze, 161; Sagarra, 145).[10]

In the early 20th century, political analysts continued to worry about relations between party organizations and elected party representatives. Like his colleague Robert Michels, Max Weber held that organizational imperatives inevitably isolated political party leaders from the broad mass of their supporters. Both men argued that the damage caused by party oligarchy could be limited by institutional changes in the links between governors and the governed. For Michels, this meant an increase in direct democracy. For Weber, this meant fostering political leaders who could be independent of both party bureaucracies

---

[10] Salaries for Reichstag members were not introduced until 1906.

and of parliamentary parties (Mommsen 1974, 186; Dronberger; Mommsen 1989, 87-108).[11]

Though both Weber and Michels saw irremedial problems with political parties in democracies, neither believed that modern mass democracy could function without multiple parties. In contrast, many regime critics in the Weimar period revived nineteenth century German arguments that competing parties are undesirable because they inevitably fragment national unity. Such critics held a 19th century view of the state as the organic embodiment of national will, while they viewed parties as being (by definition) advocates of ideas that could benefit only a part of the nation. The following quote from a 1920 article is typical of Weimar systemic criticism in the way it connects the shortcomings of parties with the shortcomings of the entire political system:

> In our time of greatest need we lack leaders. We have no policies because we have no government. The men sitting in the top positions were called to their offices not by their talent but by their membership in particular parties. They do not govern. . . . We do not believe in parliamentarism nor in democracy--these are yesterday's catch words. German democracy is the opposite of true freedom, because it fills the leading positions according to beliefs [e.g, through party appointments], not according to competence (Pechel, 457-459).

Those who held similar views usually made extreme suggestions for altering political institutions in order to protect the nation from the parties. Thus, for instance, in the early part of the decade, some nostalgic critics endorsed occupation-based representation systems. Systemic anti-party arguments of this type also supported calls for "supra party" rule by presidential decree in the last years of the Weimar Republic--exactly the type of strong leadership advocated by Weber. Systemic diagnoses were often followed by calls to save the state by "overcoming" party competition: national welfare could only be assured through suspending, if not actually abolishing, multiparty government. Not surprisingly, National Socialists used systemic arguments about the evils of multi-party divisiveness to defend the introduction of the one party state, as is illustrated in Hermann Göring's remarks to the

---

[11] For instance, Weber asserted in 1919 that, "in its present form, proportional representation is a typical phenomenon of leaderless democracy. This is the case not only because it facilitates the horse-trading of the notables for placement on the ticket, but also because in the future it will give organized interest groups the possibility of compelling parties to include their officials in the list of candidates, thus creating an unpolitical Parliament in which genuine leadership finds no place. Only the President of the Reich could become a safety-valve of the demand for leadership if he were elected in a plebiscitarian way and not by Parliament" (Weber, 114).

National Socialist Reichstag in 1934, less than a year after the abolition and dissolution of rival parties:

> We see now, how it has been possible in one year of indescribable effort and work to once again bring together a unified Reich. . . . Out of a plethora of parties, out of the disgusting strife of parliamentary groups, out of the nervous gossip of parliamentarians, the unity of the people has finally re-emerged (Deutscher Reichstag).

Extreme systemic anti-party arguments were discredited by what followed the collapse of the Weimar Republic: many Bonn Republic politicians and political analysts saw the crucial lesson of the Weimar period as the realization that good government above the parties was an impossibility. As a result, there was little dissent, sixteen years after the end of Weimar democracy, when the Federal German Republic became an official "party state". Indeed, in this era when political parties were elevated to constitutional status, parties were more likely to be assigned to the rhetorical status of sacred cow than to be castigated as unmitigated evils. Yet, even in the Bonn Republic moderate systemic arguments have been levelled against political parties. Participants in these debates have proposed a variety of solutions which, if adopted, would profoundly transform the political system.

The role of functionalist arguments in post-1945 electoral system debates has been discussed in an earlier section. These debates were also fuelled by systemic arguments about the divisive nature of party democracy. In particular, many post-war observers argued that proportional representation systems needlessly widen the gap between members of parliament and those who elect them, and that they weaken individual politicians by strengthening party bureaucracy. Because of such arguments, most postwar German electoral systems (both state and Federal) fused single member districts to proportional representation systems. These hybrid systems were intended to both increase the regime's perceived legitimacy (because each voter would be able to identify a single person who represented his/her interest), and to increase the incentives for individual members of parliament to pay attention to the wishes of a particular, geographically defined, segment of the electorate.

Adoption of these new systems did not end charges that the German political system created an unnecessary and dangerous distance between citizens and representatives. Thus, in the 1960s discussions about electoral system reform, advocates of single member districts argued that such a change would result in increased contacts between parliamentarians and voters. They also argued that individually-elected Bundestag members would be in a better position to heed the voices of their constituents: under a single member district system, it

was claimed, individual members of parliament would be more independent from the directions of party leaders.

In the 1970s and 1980s, German proponents of participatory democracy used systemic arguments to support the introduction of new forms of political organization. According to these critics, political parties in (West) Germany collude to exclude important popular demands. Only the expansion of direct democracy could save Germany from the rule of parties. Such criticism initially fuelled support for the citizens' initiatives in the 1970s. By the early 1980s, however, these arguments were invoked on behalf of the Greens--a movement recognized by German law as a party, but one which proclaimed itself to be an alternative to traditional political party organization. Greens supporters argued that this new anti-party party would change the whole nature of German politics by introducing a completely new policy agenda, backed by completely new ways of doing politics (Huber).

As this section has shown, extreme systemic arguments have been employed by some of Germany's fiercest critics of competitive politics. But even some who have viewed the political realm as the legitimate arena of competing interests have shared the opinion that existing party arrangements are unhealthy: it is not just German anti-democrats who have called for fundamental changes in the ways in which parties mediate between citizens and the state.

Contemporary Anti-Party Critiques in Germany

The preceding discussion has sketched out the ways in which various types of anti-party arguments have been recurring and integral elements in struggles to modify, preserve, or overthrow the German political system. It has not only shown the ways in which certain types of arguments have been "recycled"; it has also shown the link between specific types of criticisms and arguments for distinct types of changes. Precisely because a variety of anti-party arguments have been at the center of so many debates about German political reform, it is misleading to try to interpret contemporary debates as merely the result of "post-modern" social changes. Instead, these debates should be viewed as the latest wave in a recurring cycle. From this perspective, one relevant question is, "where do today's debates fit into the repeating pattern of such debates in Germany?". Another question is, "to what extent do the categories proposed at the beginning of this paper provide a basis for making predictions about the consequences of today's debates?". To anwer these questions, it is necessary to briefly examine the content and circumstances of contemporary debates.

In the 1970s, symptoms of popular disaffection with established political parties

prompted German academics to begin the search for causes, and possible cures, of a newly diagnosed social disease: Parteienverdrossenheit. Though the consequences, and even the existence, of Parteienverdrossenheit were intermittently debated in academic journals and books in the 1970s and 1980s, this debate blossomed in newspapers and more popular periodicals in the 1990s, once the initial euphoria (or shock) of German unification faded. The current resurgence of anti-party critiques has been fueled by two types of events: by declining turnout and increasing "protest party" voting in state and local government elections since 1990, and by President von Weizsäcker's attacks on the party state, published in early summer 1992. The ensuing spate of editorials, articles, and books about "the" problem(s) with parties and the party state prompted the Society for the German Language to vote Politikverdrossenheit (vexation with politics) "word of the year" in 1992 (Dietze, 4).

In von Weizsäcker's widely publicized interview with editors of Die Zeit magazine, the President levelled three over-arching charges against political parties and party politicians, all of which supported the President's view that Germany suffers from an overdeveloped party state. First, he argued that partisan competitors are so obsessed with winning elections that they fail to make good public policy decisions. Second, he charged that public policy also suffers because party procedures tend to promote the wrong type of politician--favoring those who have made long careers in politics to the exclusion of those who have experience outside of politics. And finally, von Weizsäcker charged that German society suffers because parties have pushed themselves into social arenas in which partisan politics should not play a role--for instance, party sympathies are taken into consideration in university appointments, in the running of non-political social clubs, in school board decisions. In short, in von Weizsäcker's much-cited summary, the German party state suffers from having parties which are "power-crazed for electoral victory and powerless (irresponsible) when it comes to understanding the content and ideas required of political leadership" (machtversessen and machtvergessen)(von Weizsäcker, 164).

The President proposed several cures, all of which would represent a retreat for the parties: the "supra-party" character of the Federal Presidency should be strengthened; at the local level, all Germans should directly elect their mayors and should be allowed to participate in referenda; all party members should be able to directly participate in the selection of candidates for public and party office; and parties should stop trying to exercise their influence in realms like churches, the media, and education.

The President's well-publicized remarks generated a flurry of sharply divided articles and editorials. Many party critics incorporated the President's remarks as preludes to their

own complaints about current political arrangements. Others, particularly party politicians, criticized the President for making populist attacks on institutions and individuals who were trying their best to serve the nation in a particularly difficult period (for instance, the SPD Minister-President of North-Rhine Westphalia, Johannes Rau) (Der Spiegel (a)). Some even accused von Weizsäcker of ill-advisedly serving the interest of right-wing extremist politicians (for instance, the Federal Labor Minster) (Blum, 20).

Though von Weizsäcker's comments gathered more attention than most contributions to the recent German debates about "the problem(s) with parties," his diagnoses and proposed cures were similar to those being urged by many other contemporary party critics. While such critics have used a variety of evidence to buttress their arguments, most have concluded that the parties' problem or problems are an integral part of the whole party-government system. Such analysts describe their subject in appropriately dramatic terms: "the crisis of the parties" (Rüttgers), a "crisis of the party system" (Kauder) "a crisis of party democracy" (Apel) a "crisis of the party state" (Glotz; Haungs), or even "a crisis of politics" (Kleinert).

Once again, Germans making systemic attacks on political parties have risked confronting the "sacred cow" mentality--the charge that any change to the parameters of the current party state would be a retreat from democracy. To combat this, most systemic critics have openly (and more or less convincingly) proclaimed their support for democratic systems. Even a book with the provocative title "To hell with the politicians" dutifully includes a chapter titled "Politicians--a necessary evil" (Gloede).

Given their view that the whole system is diseased, it is not surprising that such critics usually advocate Type III "cures" for the problems of the polity. For critics who argue that the basic problems with the contemporary German party state are weakened ties between citizens and political parties, and between citizens and the state, the favored prescription is the creation or expansion of channels for citizen participation, and a corollary reduction of the influence of existing parties and/or party elites. Specific "cures" frequently endorsed by today's systemic critics include: decreasing the power of party leaders by increasing internal party democracy; changing state and/or federal constitutions to permit the use of referenda and initiatives; and selecting a non-party Federal President (for instance, Apel; Haungs; Kauder; Richter; Rüttgers; Scheuch & Scheuch). Others, including von Weizsäcker and Jens Reich (who is often mentioned as the President's possible successor), have gone even further and demanded constitutional changes to limit the power of political parties (Reich; von Arnim; von Weizsäcker).

While such systemic diagnoses and proposed cures have dominated the contemporary debates, other types of diagnoses have not been altogether absent. Thus, a few have argued that what is needed is programmatic change: that the traditionally large "catch-all" parties need to sharpen their programmatic claims and to emphasize their differences in order to recapture voters who are looking for leadership and ideas (Kleinert; Schultze; Wiesendahl). Others have suggested that electoral change (to a British style system) could strengthen links between voters and governments (Betz; Jäger). But these voices have been in a minority, and these suggestions have not gained much publicity in the popular media. Furthermore, even some who endorse functionalist changes, such as electoral or party finance reform, refuse to describe these as comprehensive cures for what ails the body politic.

This mild German support for Type I and Type II solutions suggests that we should not expect a rash of programmatic or functional changes in response to the current debate about parties. In this sense, contemporary debates in Germany differ from those in Italy in 1992 and early 1993, where diffuse popular discontent with politics as usual was translated into an elite & popular consensus on the curative powers of changing electoral and political finance laws. On the other hand, while contemporary German observers seem to share a widespread agreement about the need for Type III "cures" for existing political problems, it is still not clear whether such an agreement will translate into political change. Systemic changes to diminish the influence of all political parties are difficult to enact, particularly in a system where the parties themselves are the sole gatekeepers for change.

However, the possibility of lasting systemic change seemed to increase in the late spring of 1993 in the wake of the SPD's use of a membership canvass to select its new party chair.[12] Though the party's unprecedented use of such a "primary" was initially viewed as a desperate response to a series of self-inflicted injuries, the effort proved surprisingly successful. Over 55% of members cast preference votes on the single election day, and the election produced a clear winner in a three way race. Political party leaders and the German media were tremendously impressed by the participation rate, and by the ballot's clear verdict. As a result, SPD leaders promised to expand the use of party primaries and party referenda to decide policy directions. At the same time, some CDU members starting calling for similar opportunities. Within weeks of the SPD election, the CDU state party organization in North-Rhine-Westphalia changed its rules to introduce party-internal

---

[12] This was a non-binding vote to advise the party conference, which formally elects the party chair.

primaries and programmatic "referenda". Other state parties may follow suit (Frankfurter Allgemeine Zeitung a, b, c; Frankfurter Rundschau; Der Spiegel (b)). This switch towards candidate selection through member-primaries is precisely one of the systemic reforms that party critics have been urging as a way to reduce the power of party elites.

Despite the current popularity of expanded direct democracy within the parties, it is too early to say whether other types of extra-party direct democracy will be adopted. Above all, there still seems to be little likelihood that the SPD will get its wish of introducing referenda and initiatives into the package of federal constitutional changes now being debated, despite the support of President von Weiszäcker (Das Parlament). However, it is possible that expansion of direct democracy will be picked up as a theme in the wave of state or federal elections in 1994. A further possible change that might result from current anti-party debates could be the unprecedented selection of a non party-member as the next Federal President, a move that would strengthen the "supra-party" character of this office (Die Zeit). In short, because this wave of anti-party criticism is predominantly phrased in terms of systemic attacks, the most likely changes to result from current debates are (probably small) steps away from the party state.

Concluding Thoughts

This paper has argued that there is a logical link between types of party criticisms and types of proposed remedies. It has used examples from nineteenth and twentieth century Germany to clarify the proposed typology, and to demonstrate the plausibility of the argument. The typology presented in Figure 1 could also be phrased as a set of formal hypotheses: if party critiques are framed in terms of x, then y sorts of changes will be endorsed. (Or, obversely, those who want y sorts of changes will criticize parties in terms of x.) Of course, there are two crucial questions that remain to be answered about these (as for any) hypotheses: 1) Does the addition of evidence make them seem more or less plausible--what happens when more cases are examined? 2) Do they increase our understanding of the political world?

In trying to answer the second question, I have attempted to demonstrate in discussions of historical and contemporary German debates that this classification of anti-party attacks can help us understand the probable consequences of such agitation. To answer the first question, we need both cross-temporal and particularly cross-national studies of anti-party sentiment, particularly studies that put current discussions into historical context. The point of such studies should not be to provide fuel to attack today's anti-party

critics, for instance by showing that they utilize arguments once wielded by those who favored totalitarian systems. To selectively invoke history in this way would be to make the absurd suggestion that parties truly ought to be regarded as sacred cows, off limits for contemporary criticism. On the other hand, comparative studies will likely serve as a reminder that political parties have often been regarded--equally absurdly--as a different sort of animal: not as sacred cows, but rather, as scapegoats. What is needed instead are studies which view elite anti-party attitudes as a legacy of Western political thought, and which view anti-party populism as a mobilizational appeal that has been tested many times in a variety of political systems. Such studies, especially if aided by an accepted vocabularly to facilitate cross-national comparisons, could push us far towards understanding the causes, and consequences, of anti-party sentiment.

Style vs. Substance

in the

Rhetoric of the Great Communicators

Todd M. Schaefer and Ronald Kim
Department of Political Science
Northwestern University

Paper to be Presented at the 1993 Annual Meeting of
the American Political Science Association
Washington, D.C., September 3, 1993

ABSTRACT

This study explores the nature, role and functions of presidential rhetoric in the modern era through an examination of selected State of the Union Messages of the three "great communicators" of the White House in the last Century: Franklin D. Roosevelt, John F. Kennedy, and Ronald Reagan. It asks the questions are these presidents' (generally seen as more effective at public speaking than others) stylistically similar? Does the medium of communication affect presidential speaking style and substantive content? Do these messages serve as a means for concrete issue discussions, or are they "merely rhetoric"? And finally, is there a connection between a speech's content and its rhetorical complexity (i.e., a relationship between style and substance)?

We attempt to answer these questions through an examination of these presidents' speech complexity and degree of susbstantive, as opposed to symboilc, content. We expected Roosevelt to be more verbally complex and substantive because of his primary use of radio and the political environment of his times, while Kennedy and Reagan, as televised "Going Public" presidents would be less so.

We found Roosevelt to be the most stylistically complex and verbally pedantic of these presidential public relations "experts." FDR was also the most substantive, in terms of tying his rhetoric regarding issues concerns into policy proposals presented in front of Congress (and the American people) during the addresses themselves. Reagan was the most simplistic, and similarly, the most vague about specific policy proposals, perhaps in part accounting for his greater skill in public politicking and greater mastery of the television medium. Kennedy, falling between the other two historically and rhetorically, appears to represent a transition between eras of presidential public leadership styles.

While the study does not conclusively prove the effects of medium on message, nevertheless it appears that much of the original hypothesized pattern holds true: a strong substantive content requires greater complexity to convey, which (ironically) results in a weaker ability to convey that message. This finding in turn has implications for presidential public leadership in the television age, for it suggests presidents may be more effective in presenting their positions and solutions for the nation's problems if they do so in more vague and symbolic ways.

INTRODUCTION

Until recently, there was a dearth of literature on presidential speech. But with the contributions of writers such as Hart, Tulis, Graber, Stuckey, and others, research into the presidency and its use of political language has expanded in many directions. Some have emphasized the semantics found within the language the president uses to communicate with the public. The specific content of speeches is the unit of analysis and these authors view it as fundamentally important for several reasons. First, a president's words can shape ideas and stimulate political activity. Second, they can justify decisions and provide rationales for action. They can also serve to inspire, comfort, and motivate a nation.[1]

Other writers have underlined and elaborated on other aspects of presidential rhetoric. In The Presidential Character, Barber identifies communication as a major influence on presidential performance.[2] Roderick Hart examines the institutional features and effects of verbal style as well as compared presidential styles to that of other leaders in some of his work.[3] In a later work he discusses not so much what the presidents said as why they said what they said when and where they said it. [4]

For all these authors communication, at least implicitly, represents a means for the president to acquire and maintain power through persuasion. As Doris Graber suggests, "Politics is largely a word game. Politicians rise to power because they can talk persuasively to voters and political elites."[5] The words of a president establish the public record of the administration and often reflect the goals and values of the public. Some have even suggested rhetoric is so crucial to the presidency, presidential leadership is based on words, not power.[6] Other scholars have examined presidential rhetoric in relation to modes of communication and the historical context of the times.[7]

The question of whether presidential speeches have changed in recent years inevitably raises the issue of television and its influence on those speeches themselves. There is an increasing abundance of literature indicating that television has directly affected the verbal content and delivery of rhetorical performances.[8] Hart's findings suggest presenting a vigorous message in the simplest manner is perfectly suited for the medium of television. In short, television has served to decrease the sophistication of presidential speeches.[9] Because of the nature and pervasiveness of this mass communication medium, more attention than ever surrounds a president's appearance and "image".[10] The ability to communicate effectively is seen as even more important in an age when presidents can address the public directly through the mass media.[11]

While previous work examines and points to the importance of semantics

and delivery in getting across the presidential message, and the degree to which presidents now concern themselves with speaking, little has been done to link verbal style with substantive content.

In the following pages we hope to address both the content and style of presidents Franklin D. Roosevelt, John F. Kennedy, and Ronald W. Reagan, as examined through their State of the Union Messages. We chose these three for comparison because of their similarity in a number of areas, but primarily because each of these presidents was seen by contemporaries and by history as "Great Communicators". Each left an indelible mark on the Presidency, both in general and the area of presidential public relations. In this examination, we hope to explore a number of questions. Are these presidents (generally seen as more effective at public speaking than others) stylistically similar? Has presidential speech changed over time, especially with the development of modern mass communication? Do these messages serve as measures of policy concerns and action, or are they "merely rhetoric"? And, more ambitiously, is there a connection between a speech's rhetorical devices and substantive content? In other words, is there a relationship, as some observers claim, between style and substance?

In order to answer these questions, we will examine these presidents' speeches in terms of presentation "style" and content "substance". We then attempt to examine possible relationships between these two areas. As all of these presidents were "Great Communicators" of their day, we might expect to see patterns of simliarity between them, regardless of their historical era and mode of communication. On the other hand, if television has altered the landscape of political rhetoric, we might discern differences between "radio" president Roosevelt and the "television" presidents Kennedy and Reagan.

DATA AND METHODOLOGY

The data used in this study consists of three State of the Union addresses of each of Presidents Roosevelt, Kennedy and Reagan. Many scholars have emphasized the significance of State of the Union messages. They point out their unique features: they take place at regular intervals, as mandated by the Constitution; they enjoy a huge viewership; they are carefully and thouroughly planned in advance; and they generally reflect the president's concerns and national priorities for the coming year. Because of their intimate link to what the chief executive has on his mind and his need to present it in a dynamic manner to appeal to a wide audience, these messages offer important insights into individual presidents. As mentioned earlier, these three presidents were selected for their apparent particular aptitude as effective public communicators. Therefore, these

presidents should provide a benchmark for assessments about presidential rhetoric as a whole.

Following Neustadt's argument that in the search for patterns in the presidency, the crucial years of a president's tenure are the third, the fifth, and the sixth, we chose the years 1935, 1937, and 1938 for Franklin Roosevelt and 1983, 1986 and 1987 for Reagan. This guideline also conveniently enabled us to examine the same number of addresses for each of the presidents, as Kennedy's aborted tenure allowed him the opportunity to deliver a total of three messages (1961, 1962, and 1963), forcing us to use all of them. Nevertheless, we think this group of speeches gives us a good sample of presidential verbal work.

The speeches varied in length from a low of 2713 words to a high of 7030. Roosevelt averaged 3926 words per speech; Kennedy, 6062; and Reagan, 4551.

In terms of method, different approaches were used in measuring and analyzing our presidential samples in terms of style and substance.

To gauge a president's speaking style, we chose to focus on verbal complexity, the idea being that simpler delivery results in greater effectiveness. To measure complexity, we analyzed the speeches with Rightwriter, a computer software program which ordinarily helps in the writing of strong and clear documents. Applying rules that deal with syntax, or structure, of writing, it searches for various types of errors that obstruct a "lean and powerful" style,[12] including extraneous and overly-complicated words and phrases, the passive voice, and long sentences.

How can a writing tool indicate the simplicity or complexity of presidential rhetoric? In the case of Rightwriter, there are a number of valuable measures encompassed in its program, including:

1) Readability Index: This index tells the user the level of education required to understand the document. It is composed of the Flesch-Kincaid formula used by the U.S. government as a guideline for the production of manuals by defense contractors.

2) Jargon Index: It measures the use of vocabulary known only by people in a specific profession or business. In a Rightwriter analysis, jargon is considered an impediment to effective communication. It ranges from 0 to 1.

3) Strength Index: It measures the strength of delivery of the document's message. It puts a premium on common words, necessary qualifiers, and simple sentence structure. It also ranges from 0 to 1: a value of 1.0 indicates a very strong and

effective style according to this criterion while a value of 0.0 indicates a weak, wordy, style.

4) Average Number of Syllables per Word: The more syllables/word, the greater the probability of long and complex words.

5) Average Number of Words per Sentence: The longer the sentences, the more complex and wordy the style.

6) Percentage of Unique Words Within the Document: The larger the percentage of unique words, the greater the likelihood of a larger vocabulary and greater complexity.

Rightwriter analyzes documents by applying strict statistical rules that address the structure of writing but does not identify every stylistic weakness. However, for the purpose of demonstrating the difference in complexity of presidential addresses, the above measures are still very useful.

To gauge presidential substance, we analyzed the content of their addresses in two ways. First, we examined the degree to which these presidents discussed political issues in their speeches as opposed to vague appeals to patriotism, homage to national icons, personal experiences, platitudes to Congress, or fables, anectdotes and stories. We divided sections of the speeches into these two categories. A "symbolic talk" variable was created as the percentage of speech (in lines/column inches) largely devoted to symbolic messages and an "issue talk" variable which was the amount devoted to discussion of concrete, identifiable issues.[13]

But how exactly did these presidents deal with those subjects they chose to speak about? Do their discussions relate to concrete action on these issues, or are they merely talking a lot about them, while in fact doing little?

To answer this question requires a comparison of the issue categories within a presidency in order to determine this measure of substance. Here we analyzed text from the issue categories with an eye toward distinguishing "rhetoric" from "action". While it is true speaking about an issue is itself an important political act, here we try to to what extent these presidents speak about taking action on these issues, as opposed to discussing them more generally and taking "symbolic" rather than concrete, stands.[14]

We created specific issue categories within each of the three policy areas seen as making up the modern presidency (Economic Affairs, Domestic (Social) Policy, Foreign Policy)[15] through the use of keyword dictionaries (see appendix). In addition, these policy areas have been found to account for a large amount of

content of State of the Union messages.[16] The categories were Spending, Taxes, Budget, Employment, Government Involvement, Inflation, and State of the Economy within Economic Policy; Civil Rights, Education, Welfare, Poverty, Crime, Health and Morals/Ethics within Domestic Policy; and Security, Defense, Western Hemisphere, Third World, Cooperation, Conflict, International Economics within Foreign Policy, respectively. Numerous keywords were selected within each, but only those which occurred at least once in any Presidential message were included in the final form.

The primary method employed for this part was computerized qualitative content analysis. More precisely, this part of the study uses tabulated frequency occurances of particular chosen keywords in context (KWICs). This method enables the researcher to "decontextualize" words with multiple meanings so that only ones which are used in the desired fashion are counted. For example, if a president who used "defense" in the context of "every American deserves a right to own assault weapons for personal home defense", the word would not be counted in the same category as one who said "America must continue to have a strong national defense." In this case, keywords were selected as superior to the space-content measures used previously because words are more flexible units of analysis (to help alleviate coding problems when, for example, the president briefly mentions the economy in the midst of a discussion on foreign policy).

We measured "action" as opposed to "rhetoric" in the following fashion. For each keyword within the subject categories, we looked for a reference to a particular proposal, bill, law, piece of legislation, executive action, treaty or formal agreement within twenty-five words on either side. Though this standard may be arbitrary, we feel it gives each president ample room for discussion of these issues concretely, and at any rate is the same for all of them.

HYPOTHESES

Ideally, if there is some magic formula for communicative greatness, all of these presidents should be similar in terms of verbal complexity and substantive content. Similarly, if there is a relationship between style and substance, we should see it mirrored in the speeches of these presidents. However, if as some have suggested the criteria for "great communication" has been altered by the nature of the medium, we would expect differences between Roosevelt, a "radio" president, and the "TV" presidents Kennedy and Reagan. Namely, Roosevelt should show a higher level of verbal complexity, because of radio's mainly audio component. Likewise, if the visual, "cool" nature of television truly makes it the "boob tube" we should find Roosevelt with a greater attention to issues over symbols, and in terms of issues he should also be more likely to address them in a

more concrete fashion (a higher degree of "action" than "rhetoric") than the suave television presidents.

RESULTS

According to our hypothesis regarding style, Roosevelt's speeches would be characterized by greater sophistication than those of Kennedy and Reagan. If this hypothesis is true, then the utilized measures of Rightwriter would indicate their more complicated, and hence presumably weaker style. Was this the case? Were Roosevelt's addresses characterized by higher readability and jargon indexes; lower strength index; a higher average number of syllables per word and words per sentence; and a greater percentage of unique words?

For the most part, the results indicate this expectation to be true (See Table 1). The readability index rankings in descending order were Roosevelt, Kennedy and Reagan, with mean scores of 13.9, 10.3 and 8.7, respectively (See Fig. 1). FDR's speeches on average required the highest level of education to understand (fourteenth grade, or post-high school), while Kennedy's (tenth grade and Reagan's (ninth grade) were lower. Use of a paired t-test shows that these results are statistically signifcantly unlikely to be due to chance. The level was lower for Kennedy and substantially lower for Reagan's speeches, for whom a ninth-grade education would suffice. Reagan's low score perhaps reflects the effect of television in decreasing complexity, and Kennedy's somewhat higher score strengthens this conclusion, given both are lower than Roosevelt's.

The strength indexes reveal a similar pattern. FDR had the lowest score at 0.00, and Reagan the highest at 0.49. Kennedy was in-between, but again was closer to Reagan than Roosevelt with 0.40.

The jargon index was the same for all the addresses -- 0.00. It appears none of the presidents relied heavily on specialized vocabulary that would obstruct clear and concise communication.

The results of analyzing the average number of syllables per word and words per sentence (both within and across addresses) correspond closely to the readability indexes. Roosevelt had 1.62 syllables per word, Kennedy had 1.58 and Reagan, 1.54. Roosevelt's 22.32 words per sentence was greater than Kennedy's 18.78 and Reagan's 15.58 (see Fig. 2).

The only measure that failed to reveal Roosevelt's greater complexity of style was unique words as a percentage of the the total number of words delivered in the addresses. If this measure indeed indicates the vocabulary used, it implies Reagan used just as extensive a vocabulary as Roosevelt (31%), followed closely by Kennedy (29%). The closeness of all the presidents on this dimension seems to

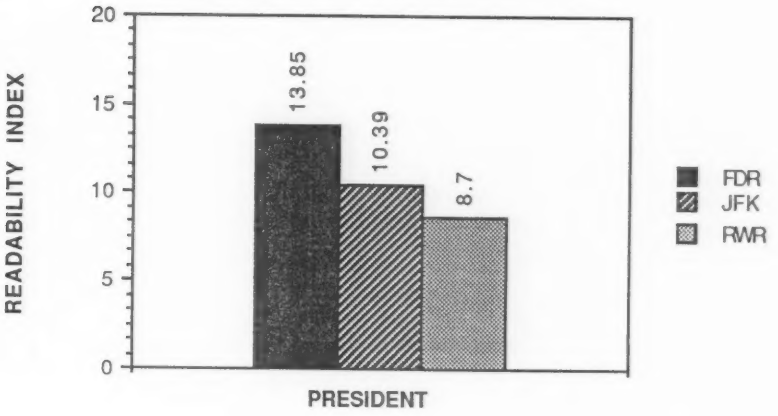

Fig. 2: Number of Words/Sentence

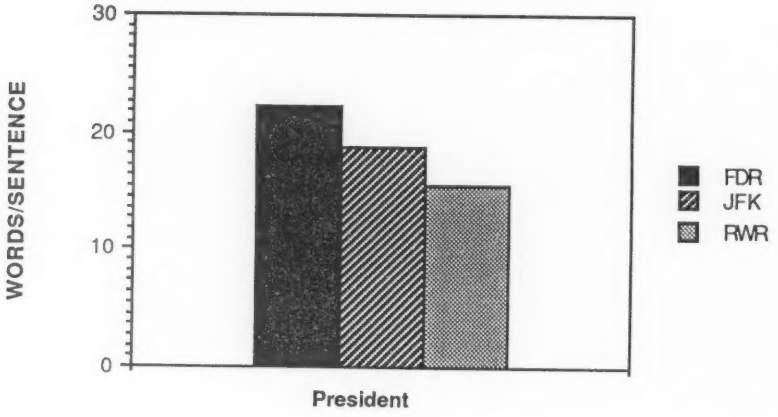

refute our assumption about television simplifying word variety.(see Fig. 3)

Finally, an extensive visual analysis of errors Rightwriter flagged reinforces most of these findings. Rightwriter criticized FDR and JFK's addresses for the use of passive voice and long sentences, much more frequently than Reagan.

Turning to the substantive dimension, here too we find evidence of variation between these political speakers. On our first measure of substance, the degree of issue versus symbolic verbiage, we again see Roosevelt at the highest level, followed by Reagan and Kennedy. Again, however, all of them are different, and significantly so, though the TV-era presidents are closer on this measure (see Table 2, and Fig. 4).

Looking at this measure in a more qualitative light reinforces the impressions from the numerical data counts. The bulk of "symbolic" passages in the texts of these speeches tends to come from the introductory and concluding sections, and are illustrative of the ways these presidents used symbolic speech. Interestingly, these sections seem to be growing longer over time - with Roosevelt's brief salutory introductions and pointed conclusions giving way to Reagan's opening quips and sentimental endings. A brief example of each president's own words gives a better feel for this finding, though these samples are offered merely as illustrations for the reader and are not meant to be comprehensive analyses.

Roosevelt used his introductory and concluding remarks to link his substantive message and programme to the larger socio-political context. For example, in the introduction of his message in 1935, he states

> Throughout the world change is the order of the day. In every nation economic problems, long in the making, have brought crises of many kinds for which the masters of old practice and theory were unprepared. In most nations social justice, no longer a distant ideal, has become a definite goal, and ancient governments are beginning to heed the call.

Likewise, closing his 1938 address, he said:

> Not because of the pledges of party programs alone, not because of the clear policies of the past 6 years, but chiefly because of the need of national unity in ending mistakes of the past and meeting the necessities of today, we must carry on.
> I do not propose to let the people down.
> I am sure the Congress of the United States will not let the people down.

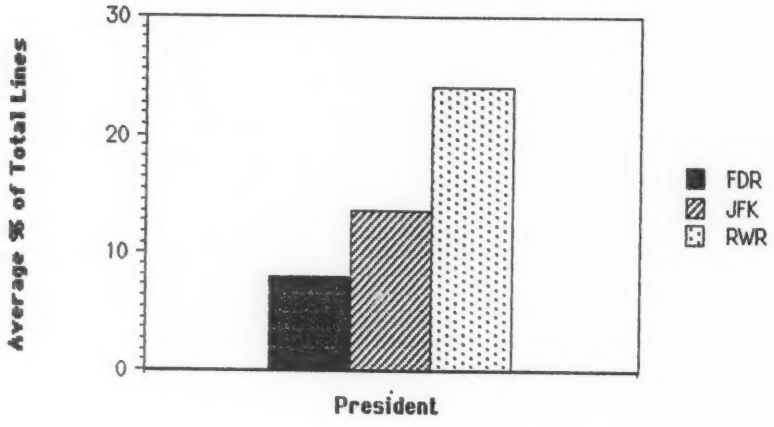
Fig. 4: Symbolic Talk



Kennedy also used these parts to relate to his program, but in more coherent, rhetorically packaged way. Perhaps without the benefit of a national disaster like FDR had, Kennedy painted his era as a time of danger requiring the kind of leadership he could, and would, provide. In the beginning of his 1961 message, soon after assuming office, he emplored:

> I speak today in an hour of national peril and national opportunity. Before my term has ended, we shall have to test anew whether a nation organized and governed such as ours can endure. The outcome is by no means certain. The answers are by no means clear. All of us together--this Administration, this Congress, this nation--must forge those answers.

A year later, he saw progress in meeting these challenges, but (perhaps foreshadowing the various foreign crises that would envelop the rest of his presidency) argued the fight must go on, almost revelling in the hazardous uncertainties of the future:

> A year ago, in assuming the tasks of the Presidency, I said that few generations, in all history, had been granted the role of being the great defender of freedom in its hour of maximum danger. This is our good fortune; and I welcome it now as I did a year ago. For it is the fate of this generation--of you in the Congress and of me as President--to live with a struggle we did not start, in a world we did not make. But the pressures of life are not always distributed by choice. And while no nation has ever faced such a challenge, no nation has ever been so ready to seize the burden and the glory of freedom.

Reagan, for his part, used the beginnings and endings of his addresses to set the mood and tone of the speech as well as providing metaphorical examples of his view of the world.[17] He used these parts of his messages to show Americans just what kind of nation they lived in. In calling on Congress to think of posterity and the commonweal of the noble American masses, Reagan counseled

> if we care what our children and our children's children will say of us, if we want them one day to be thankful for what we did here in these temples of freedom, we will work together to make America better for our having been here-- not just in this year or this decade but in the next century and beyond.

He likewise demonstrated the glory of the United States and its inhabitants time and again in other messages. In 1986, after introducing the Congress and the American people to four of his "real American heroes" (a Reagan trademark used several times in his State of the Union speeches) he concluded by summarizing the meaning of these examples:

> You are heroes of our hearts. We look at you and know it's true -- in this land of dreams fulfilled, where greater dreams may be imagined, nothing is impossible, no victory is beyond our reach, no glory will every be too great.
>
> So now, it's up to us, all of us, to prepare America for that day when our work will pale before the greatness of America's champions in the 21st century. The world's hopes rest with America's future; America's hopes rest with us. So let us go forward to create our world of tomorrow in faith, in unity, and in love.

The results of the analysis on the *way* they dealt with issues reveals a good deal about the nature of these speeches. Overall, these presidents spend the vast majority of their time speaking about these issues in the abstract, rather than concrete realm of policy action. On average, they linked these issue keywords to presidential action only 17% of the time. In addition, all three varied in their degrees of policy substance according to this measure. Roosevelt did so on average 20%, Kennedy 17%, and Reagan, 14% (see Table 3 and Fig. 5). Again, though these differences are not significant, it appears there is a trend toward decreasing policy action versus general or symbolic issue discussions. Still, this finding shows on average these presidents devote about 85% of their words discussing these policies in the abstract, and less time actually proposing policies to deal with them. Thus, these addresses reflect Neustadt's observation of presidential power as chiefly the power to persuade.

DISCUSSION

The style results support our general hypothesis. We expected to find Roosevelt more verbally complex, and he was. However, we see that on some dimensions Kennedy, a "T.V. politician", is more complex and similar in style to Roosevelt than Reagan, the consummate television president. Does this finding reflect the influence of television, or could other things be at work?

Though it is important to consider many factors, one possible explanation is the personality and background of each president. FDR and JFK were extremely well-educated individuals from wealthy, cosmopolitan families (though Roosevelt

Table 3: Rhetoric vs. Action

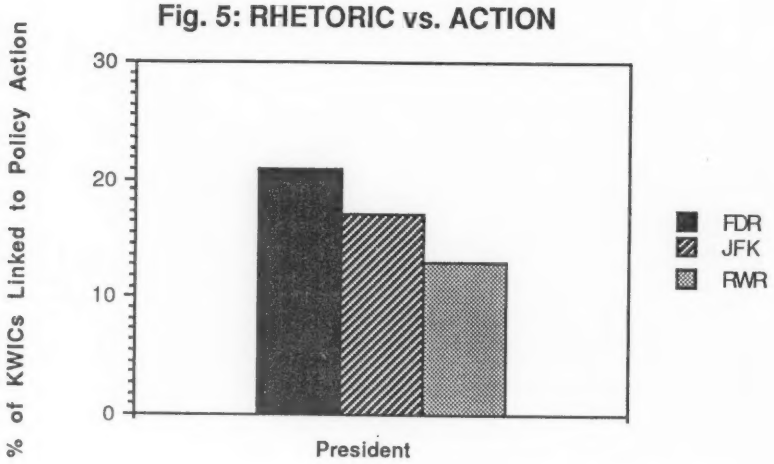
Fig. 5: RHETORIC vs. ACTION



was patrician "old money" and Kennedy, "noveau riche"). Their rhetorical style might thus reflect the complexity of their views and sophistication in their backgrounds. In contrast, Reagan was of working-class background, not as "worldly" or educated. He in fact had a reputation for his relatively unsophisticated views and simple yet effective communication style. Further examinations of other presidents, such as Truman and Eisenhower, with backgrounds more simliar to Reagan's, might be of value.

Reagan also had two advantages over Kennedy in his quest for simplicity. First, due to his acting experience, he understood better than any other president the dynamic elements involved in communicating on television. Secondly, he had the historical advantage of serving at a later date which gave him and his advisors greater awareness, hindsight, and ability in constructing effective messages. Since Kennedy served when television was still in its infancy, he perhaps did not adopt the same approach perfected twenty years later by Reagan.

In the realm of substance it also appears that the medium, and not mere individual presidential preference, may be an influence on the presidential message. There appears to be a downward trend toward substantive issue discussions in these messages even as the ability of presidents to reach more of the public with their words has increased. It is entirely possible, of course, that their own political and other circumstances may account for variations in these areas. For example, Roosevelt, with a crisis atmosphere, landslide victories and wide majorities of his own party in Congress might have been more free to propose ready answers to the nation's problems while the young, inexperienced, and narrowly victorious Kennedy and the anti-government outsider Reagan had less reason to do so.

CONCLUSION

In this work we set out to discover whether there were patterns in the styles and substantive content of speeches made by the three most acclaimed presidential speakers of the modern era as a guide to the criteria of presidential rhetorical leadership. More broadly, we also wanted to find out if there is a relationship between style and substance, and whether the dominant medium of communications available might be an influence on these elements of speech.

To analyze style, we examined the levels of complexity of presidential rheotric of our three subjects, attempting to answer questions about the relationship of verbal style to communications media (namely, TV versus radio), and the personal background and speaking styles of these leaders on their public appearances. We found that all three Presidents did differ in the degrees of

complexity of their addresses. It also appears that the presidency has indeed been changed dramatically be television, as far as public speaking is concerned. However, the personal characteristics, talents and history of presidents may offer alternative explanations for these differences.

Next, we examined these presidents' addresses in terms of the substantive content of their messages. The goals here were to compare speeches in order to determine the degree to which they are used for symbolic, as opposed to issue, appeals, and lastly, whether they represent a means for conveying substantive policies or are instead a forum for silver-tongued rhetoric devoid of real content. We concluded these messages do reveal differences between the presidents in the amount of substantive issue discussions, and found that presidents spend the most time speaking generally about issues rather than creating specific measures to deal with them.

But is there a connection between these two elements? We believe there indeed exists a relationship between style and substance, and see evidence of it in the findings from the two areas of our study. Strong substantive content requires a greater complexity to convey, which results in a weaker ability to convey that message. A strong style results in simplistic delivery, but is achieved largely at the expense of content.

Franklin D. Roosevelt was the most complex of the three in his verbal style, requiring a higher level of understanding to interpret his message. Likewise, to a greater degree than the other two presidents, he spoke about issues over symbols and concerned his addresses with specific policy proposals to deal with those issues he chose to discuss. It appears he not only reassured the nation during tough times but also offered seriously-thought out solutions to the problems the country faced.

Perhaps the use of radio and print as the primary means of getting his messages across to the public was better suited to the kind of public address he utilized. These findings may also reflect the nature of the audience he was addressing (probably more Congress than the public, as was the custom then, before television) and the political environment he worked under, one of elite bargaining. As Kernell has noted, under the era of "institutionalized pluralism", support from elites in Washington was of equal, or even more, importance than the public.[18]

Kennedy, the first full-fledged television president, was less complex in his style than FDR and slightly more than Reagan. He was also less likely to fill his messages with issue as opposed to symbolic language, though more so than Reagan. He also was second in terms of linking his verbal efforts to action. His efforts to be an activist president in the mold of FDR apparently are reflective in his addresses.

Nevertheless, the relative lack of attention to issues in his speeches during the turbulent 1960s and his reluctance to deal with volatile issues such as Civil Rights and Vietnam perhaps reflects an unwillingness to accept the political risks needed to resolve the problems of his day.[19]

Reagan represents the other end of the scale: the strength and effectiveness of his simplistic messages, so appropriate for TV, at the same time forced him to do so at the expense of discussing policy issues during his tenure. His skill as "The Great Communicator" of television may have been due to his ability to capitalize on the emotional qualities of this medium, by using stories of America's past and future greatness, examples of individual heroism, and borrowing stirring lines from other famous Americans. He also talked the least about specific policy proposals, choosing instead to discuss issues more generally. His emphasis on more symbolic issues (like balanced budget amendments, prayer in school, crime, drugs, and morality) show his propensity to deal with politics in a more rhetorical manner. Perhaps his success was due in part to the fact he emphasized different kinds of issues, like religion.[20]

It seems presidents, in their quest for simplicity, and to attract public attention, have increasingly turned more to verbal gimmicks than action. The findings here also fit well with Kernell's models of presidential political environments. The "institutionalized pluralism" of FDR's day apparently allowed for more sophisticated rhetorical appeals based on frank policy discussion. With the coming of "individualized pluralism" of the Reagan years, where "Going Public" is a fundamental presidential strategy, messages need to be shaped for consumption by the general public, not just elites, and so simplicity and saavy are the order of the day. Kennedy, falling between these two presidents both historically and rhetorically, perhaps can be seen as a transition between these two eras.

Areas for future research include increasing the sample of presidents to better see if historical and personality factors are at work here. More speeches could be added to give a more accurate depiction of presidential speaking. In addition, public opinion polls about these issues, and the presidents themselves, might be correlated with the nature of the rhetoric, both complexity and substance.

Also, while we cannot demonstrate conclusively the effect of television and the changing American political culture on the "style vs. substance" question of the presidency without more complete examination, some points seem worth mentioning. Changes in communications technology may not be a causal factor in determining speaking style and substance, but rather they may be causal in a different sense: those who are "good on TV", for example, may "naturally" be adept

in the ways of speaking most suitable to that medium, and this helps politically (perhaps giving them a "reputation", more media exposure, and means to build support and deflect opposition). McLuhan's notion of the differences between "cool" TV and "hot" radio may be overly simplistic and even inaccurate, but clearly it is likely the nature of a communications medium is better suited to different types of speaking, and different types of politicians, than others. George Bush's disjointed speech or Jesse Jackson's ability to rap in catchy sound bites may seem like trivial eccentricities but actually may accentuate their formal political skills. The highly visual aspect of television also adds the element of making the physical setting of a speech act more important than ever before (hence the growing concern over staging, crowd size, camera angles, etc. by the president's advisors). The emphasis on getting "good pictures" may mean that what, and how, words come out of presidents' mouths are less important than how they look while they're doing it.[21]

Finally, some implications of this study. In the fifty years between the presidencies of Franklin Roosevelt and Ronald Reagan, effective presidential communication appears to have become more simplistic and less substantive. Others have noted the changes the mass media spotlight has wrought on political discourse in the United States, and the resulting dire consequences for the American polity. We concur. If Americans are to realistically understand and appreciate the real problems the nation faces, presidents, and those who watch them, must insure issues are discussed frankly and openly, as well as eloquently. As political scientist Thomas E. Cronin wrote:

> The deceit lies in the subordination of policy substance to presidential style. ...A democratic society can be achieved only if Presidents and the public alike are prepared to speak directly and candidly to each other and are equally prepared to criticize and correct the errors made against each other. Basic to these aims in contemporary America is a Presidency that listens and speaks - and can be listened and spoken to - as something substantially more than a cosmetic-laden, public relations agency.[22]

Scholars of presidential rhetoric have warned us of the danger that symbols and slogans may replace intelligent policy discussions. Ultimately, it is the responsibility of the American people, as the spectators of presidential drama, to hold their Chief Executive verbally, as well as politically, accountable.

13. Classification of "symbolic" and "issue" passages were conducted by mutual independent coding by the authors. A passage was coded as "symbolic" if its primary subject and function was a general discussion of American symbols and values; a personal anectdote or story; a greeting to Congress or the audience; and had no identifiable issue content (like agriculture, economics, welfare, foreign relations, etc.). Obviously, "issues" themselves are in many ways symbolic; the ways in which leaders and other elites construct issues and problems is a very important part of politics, not just political communication (see for example, Murray Edelman, Constructing the Political Spectacle (Chicago: U. Chicago Press, 1988)). Here, however, we are mainly interested in the degree to which these presidents discuss the "hard stuff" of issues as opposed to the "fluff" of political symbols. We attempt to address the question of how presidents deal with these issues below.

How Adequate are Institutional Definitions of Democracy? Some Reflections Based on the Study of *Demokaraasi* in Senegal.

Fred Schaffer
Department of Political Science
University of California at Berkeley

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

About two years ago I saw a cartoon in the New York Times. It pictured Fidel Castro reading a paper with the bold-print headline "RISING TIDE OF DEMOCRACY." Around his head swam a fish. You see, Castro had been washed under a sea of democracy.

If this image of democratization as a wave were confined to the idiosyncratic imagination of one cartoonist it would not be worth mentioning. But the fact is, this image is a pervasive, albeit unexamined, metaphor used by political scientists to describe many political transformations the world has seen in the past few years. Philippe Schmitter and Terry Karl, for instance, argued recently that:

> The wave of transitions away from autocratic rule that began with Portugal's 'Revolution of the Carnations' in 1974 and seems to have crested with collapse of communist regimes across Eastern Europe in 1989 has produced a welcome convergence towards a common definition of democracy. Everywhere there has been a silent abandonment of dubious adjectives like 'popular,' 'guided,' 'bourgeois,' and 'formal' to modify 'democracy.' At the same time, a remarkable consensus has emerged concerning the minimal conditions that polities must meet in order to merit the prestigious appellation of 'democratic.'[1]

Implied in the wave metaphor, as this quote suggests, is the idea that we are witnessing a homogenization of political values, practices, and institutions as countries of the world come to embrace liberal-democracy. It is this idea I challenge. Specifically, I question the claim that the adoption of institutions normally associated with liberal democracy - multiparty competition, regular free elections, and a constitution that guarantees civil liberties - means that a political system has indeed become democratic. It is imaginable that a country may come to embrace these central institutions of liberal-democracy without the concomitant transformation of political values and practices that would be necessary to give citizens a real say in how public affairs are managed.[2]

---

Huntington, "Democracy's Third Wave" Journal of Democracy 2,2 (Spring 1991) pp. 12-34; Danwark A. Rustow, "Transition to Democracy: A Global Revolution?" Foreign Affairs 69,4 (Fall 1990) pp. 75-91.

[2] By "institution" I mean an established law, custom, or organization that patterns behavior. "Practice" is how individuals actually behave within these institutions. "Values" are judgements about the desirability of a state of affairs - in this case about the desirability of the institution of democracy and the practices

Senegal was one of the first countries in Africa to "ride the crest of the democratic wave." At independence Senegal, like most African countries, inherited liberal-democratic institutions from its former colonial masters. Within a relatively short period, however, most countries in Africa, Senegal included, moved away from pluralism towards the concentration of power in the hands of a single party, as jittery leaders attempted to shore up their uncertain power.

In the restoration of multi-party rule, Senegal was an early leader. President Léopold Senghor initiated a process of controlled liberalization in 1974 that culminated eight years later with the legal recognition of all political parties. By many accounts Senegal in 1993 has matured into a full-fledged liberal democracy with its open multiparty political system, regular free elections, and independent press. Richard Sklar calls Senegal "a full fledged liberal democracy" while Robert H. Jackson and Carl G. Rosberg maintain that Senegal is "perhaps the most authentic plural democracy in Africa." Similarly, Robert Fatton Jr. argues that "in five years under the leadership of Presidents Senghor and Diouf, Senegal transformed its authoritarian one-party state into a full-fledged bourgeois liberal democracy."[3]

To determine the extent to which political values and practices in Senegal have indeed come to converge with our own I will explore how the Senegalese have come to understand the concept of *demokaraasi* as it has been integrated into Wolof, the most widely spoken language in the country. A few words need to be said about this approach to studying politics.

Within the discipline of political science, questions about political values and practices have been addressed most commonly through a study of "political culture." The study of political culture, however, has been fraught with methodological difficulties stemming, in large part, from problems of operationalization: all too often political culture has been reduced to an aggregate of

---

of those participating in it.

[3] Richard Sklar, "Democracy in Africa" African Studies Review 26,3-4 (Sept-Dec. 1983) p. 19. Robert H. Jackson and Carl G. Rosberg, "Democracy in Tropical Africa: Democracy Versus Autocracy in African Politics" Journal of International Affairs 38,2 (Winter 1985) p. 302. individual psychologies.[4] I have attempted to avoid this pitfall by focusing on objective, shared aspects of political culture, most notably language; for language provides, as Charles Taylor stated, "the intersubjective meanings which are the background to social action... a certain set of common terms of reference."[5]

To put it another way, political practice and language are tightly connected; politics is a human activity that is conducted through language. The practice of democracy is expressed in the language in which it is carried out. Voting, electoral campaigns, competition among political parties could not take place without an appropriate vocabulary. If political practice and language are closely connected, however, there is little reason to assume, a priori, that non-anglophones (such as Wolof speakers in Senegal) should engage in political behaviors whose meaning is provided by the English word "democracy."[6]

Our concept "democracy," then, may not always be translated without modification into other languages. Returning to the case

of Senegal, concepts such as "democracy" or "*démocratie*" that developed on European soil have no direct equivalents in Wolof. Post-colonial forms of governance, however, have required of non French-speaking Senegalese a new political vocabulary, created by either projecting traditional Wolof words into the new political context or by borrowing vocabulary from French and Arabic. These projections and loans, however, carry with them meanings embedded in local history and culture (or in the case of French and Arabic loan words, meanings derived from the population's experience of these cultures) and shape local understandings of their own political practices, ideals, and institutions. In this paper I explore how these connections shape the conceptualization of *demokaarasi* in Senegal.

Such a language-based approach is, however, complicated by the tiered linguistic landscape of Senegal. French is the language of officialdom and the acculturated elite. Wolof is the native tongue of almost half of Senegal's population, and the country's lingua franca. To complicate matters more, language choice for the country's bi- and multi-lingual population varies with social and linguistic context.

For these reasons it necessary to isolate and explore political discourse in well-defined settings. Elsewhere I have examined how the Senegalese political elite makes use of the terms *démocratie* and *demokaraasi* in the public discussions and debates that take place in newspapers, conferences, party organs, radio broadcasts, and political meetings.[7] In this paper I propose looking at how another segment of Senegalese society - the non-French speaking majority of the population - makes use of *demokaraasi* in their everyday lives. I will thus present evidence from interviews I conducted with about 200 non-French speaking Wolofones to argue that there is an identifiable "folk" Wolof concept *demokaraasi* that departs in significant ways from our own understanding of democracy.

* * *

It was a hot, dusty September afternoon that I interviewed Modou Ndiaye under the welcome shade of an acacia tree planted near the edge of Thiourour, a village located about 200 kilometers northeast of Dakar, in the northern end of the wide zone known as the peanut basin. It is in this basin, about the size of West Virginia, that the majority of Senegal's rural population lives,

---

[7] Fred Schaffer, "Political Discourse in Senegal: From *Démocratie* to *Demokaraasi*." Paper prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993.

cultivating peanuts for sale in the world market, and growing millet and beans for its own consumption.

This northern portion of the peanut basin lies within the Sahel, a transitional band of savanna and sparse woodlands that bridges the Sahara desert to the north, and the more verdant tropical regions to the south. Rainfall in this zone varies greatly from year to year, and Modou remembers vividly the devastating drought that lasted from 1968 to 1974.

Thiourour is a slightly larger-than-average sized Wolof village of about 380 inhabitants. Like most villages of its size, it has no electricity or running water. It consists of 35 compounds built around a central square. Each compound typically contains both cement-brick houses and grass huts, and is separated from other compounds by a millet-stalk fence.

Modou, the eldest son of his now deceased father, is the head of his compound. At 52 years of age, he has already surpassed the average life expectancy for Senegalese men by about six years. He has two wives and ten children. In his compound also live an unmarried younger brother and the wife and children of another brother, Souleymane, who has gone to Dakar to work as a journeyman mason. The family's cash income comes mainly from Souleymane's earnings of about 75,000 cfa per year ($270), and an average of about 85,000 cfa ($310) the family receives each year for its peanut crop.

Modou has no schooling, and speaks only Wolof. He, like almost all the inhabitants of Thiourour, is a member of the Mouride brotherhood, one of Senegal's three major Sufi sects.[8] Modou does not belong to any political party. Nonetheless, like most of the other adults of Thiourour, he voted for the incumbent President Abdou Diouf in the elections of 1988, and has attended a few meetings of the President's party - the *Parti Socialiste* (PS) - in the regional capital of Louga.

I was introduced to Modou by a common acquaintance in the weekly market of a nearby village. I explained to Modou that I was researching politics in Senegal and asked if he would mind meeting with me for a few hours the following day. When I arrived, he was lying on a straw mat in the courtyard of his compound, reciting verses of the Koran he had learned as a child.

We talked about his family history and his village and Modou shared his views of President Diouf and other political leaders. At one point I asked him if he thought there was *demokaraasi* in Senegal, he responded:

---

[8] The other main Islamic brotherhoods are the Tidianes and the Quadirs.

> Yes. You cast your ballot for the party you choose. Abdou Diouf said "Here's the Mosque, whoever wants can call people to prayer." That is our *demokaraasi*. That is what brought 17 parties to Senegal.

He then went on to give an example:

> Here, if there are 100 people, 90 of them will share the same opinions. Before long, those who disagree end up joining the majority too. A while ago there were two politicians who were candidates for office. When they came to this village, we got together and asked each other "which candidate do you prefer?" Some chose the first candidate, others the second. When we saw the first candidate had more support, those who had initially chosen the second candidate immediately joined the majority to make things run better. That is our *demokaraasi* here in this village. *Demokaraasi* is important because 'what one person can do, two can do better.' 20 people can do more than 5. That's how it is here in Thiourour. We have several associations. In each one the money is managed by all the members together. We deliberate and make common decisions. *Demokaraasi* means that the group is united in wanting good and refusing bad.

What is puzzling about these statements is how Modou's village example seems to contradict his initial assertion. How could *demokaraasi* mean voting for whom one pleases, yet also require people to change their votes in the interest of group solidarity? Modou presents two ideals we normally juxtapose - individual electoral choice and group conformity - as if one flowed naturally from the other.

Of course it could be that Modou is simply giving voice to tensions already present in the Wolof discourse of the political elite. As I have discussed elsewhere, mosque and muezzin are important images deployed by leaders of the ruling party for educating the unschooled population about *demokaraasi*.[9] This religious metaphor contains explicit ideas of individual choice layered over implicit notions of communality. But the communality embedded in these metaphor is couched in images of common worship. It is a spiritual communality based on the adoration of a single God. What Modou has to say, in contrast, seems flatly secular and utilitarian. Group conformity is important because it "makes things run better." This functionality does not seem to be a mere playing out of religious themes.

---

[9] Schaffer, "Political Discourse in Senegal," pp. 30-38.

Indeed it appears that part of the contradiction stems from the fact that Modou is drawing on ideas that do not emanate directly from the Wolof language discourse of the political elite at all. That is, he is regrounding ideas presented in the discourse of the elite in his own experience of village social interaction. Talk of Abdou Diouf and national political parties gives way to discussions of community associations and local electoral politics.

Yet how Modou describes *demokaraasi* in his village and how journalists and political scientists usually characterize local-level electoral politics in Senegal are strikingly dissimilar. Where Modou stresses community-wide solidarity and reconciliation, outside observers highlight the bitterness of struggles waged between competing political factions.

These factions, called *clans* or *tendances*[10] in local parlance, are diffuse groups of people aligned behind a leading notable or family which offers cash or favors in exchange for electoral support. Most *tendances* exist within the ruling party since opposition parties are generally too weak and resource-poor to develop far-reaching patron-client networks. (The only exception is the *Parti Démocratique Sénégalais* (PDS), which appears to be developing factional rivalries, especially in Dakar and a few other urban centers where its support is strong).[11]

---

[10] The vocabulary of factional competition has been undergoing a slow evolution in Senegal. Through the 1960s factions were, in French, called *clans*. In the 1970s PS leaders began making modest efforts (that continue to this day) to depersonalize factional competition within the party. Part of this strategy entailed the introduction of new terminology and new distinctions. In PS documents, *clan* has come to refer to a faction organized around personal allegiances while *tendance* describes the ideal intraparty organization, one that coheres around shared ideas and ideology. This distinction has, however, become blurred in everyday talk. It is today common for both Francophones (and some non-French speakers) to refer to personalized factions interchangeably as *clans* or *tendances*. For an example of PS literature see Moustapha Ka, "*Parti Socialiste: la logique des tendances*" and Babacar W. Diom, "*Tendances et clans: politiser et dépersonnaliser*" in *Perspectives Socialistes* 1 (2nd quarter 1986) pp. 10-16.

[11] On factionalism in Senegal see William J. Foltz, "Social Structure and Political Behavior of the Senegalese Elites." In Friends, Followers, and Factions: A Reader in Political Clientelism edited by Steffan W. Schmidt, Laura Guasti, Carl H. Landé, and James C. Scott (Berkeley: University of California Press, 1977) pp. 242-250. Jonathan S. Barker, "Political Factionalism in Senegal" Canadian Journal of African Studies 7,2 (1973) pp. 287-303. Clement Cottingham, "Political Consolidation and Centre-Local Relations in Senegal" Canadian Journal of African Studies 4,1 (Winter 1970) pp.

In Thiourour, partisans of the opposition are few, and villagers are aligned with one of two different *tendances* that operate within the ruling *Parti Socialiste*. The larger of the two supports the chief of the largest village in the local-level administrative zone (called *communauté rurale*) in which Thiourour is located. The other is organized around the chief of another village in the same *communauté rurale*.

People adhere to *tendances* less as a result of ideological or policy commitments than out of a desire to share in the spoils of patronage. Loyalty to traditional family, community, or religious leaders who exercise local political leadership is rewarded with extra income, government employment, privileged treatment by the civil services, and protection against legal sanctions.[12] Local and regional leaders, in turn, compete for party posts, sparking bitter intraparty clan conflicts. The political survival of national leaders depend upon their ability to create a personal power base among these rival clan leaders.[13]

In Thiourour, the fiercest factional competition is for the presidency of the *communauté rurale*. This is an elected position, chosen by the voting-age population of fifty-two villages that make up this administrative zone. Because no opposition candidates have ever run for the this post (most recently the opposition boycotted the 1990 municipal elections), the real competition takes place before election day, during the intraparty process of selecting PS candidates. At times this pre-electoral selection process, and the bitter factional competition to which it gives rise, can turn violent. In 1992 factional conflict within the PS left four dead in the town of Vélingara, and several wounded in the cities of Mbour and Fatick.[14]

[12] Edward J. Schumacher, Politics, Bureaucracy and Rural Development in Senegal, (Berkeley and Los Angeles: University of California Press, 1975) p. 28.

[13] Some national leaders have been able to nurture considerable power bases more or less independent of sustained support from the center. As Schumacher noted, "There are cases where over the years certain deputies, often with the aid of powerful marabouts and community influentials, have managed to build virtual political fiefs..." Ibid., p. 41.

[14] *Sud Hebdo*, 21 May 1992 pp. 1 & 3; 18 June 1992 pp. 1 & 3. *Wal Fadjri* 3 July 1992 p. 8.

None of these elements of factionalism, though, entered prominently into Modou's description of *demokaraasi*. He speaks only of village-wide unity and solidarity. It could be that Modou is telling us about the ideal world of *demokaraasi* where there is no rivalry, divisiveness, or competition. Or, it could be that clan rivalry and divisiveness do not figure into *demokaraasi*, or stand outside its conceptual boundaries.

There is some evidence to support this latter position, for in the minds of many uneducated Wolofones, the term *demokaraasi* has come to mean, at times, simply consensus or the achievement of agreement. Consider these statements:

> There is *demokaraasi* in our village because each time we disagree, we straighten things out (*juboo*), we mend things.
>
> - Mouride blacksmith in town of Coki, male, 38 yrs old.

> *Demokaraasi* means ironing out disagreements (*juboo*) between you and those in your community.
>
> -Street vendor in Dakar, Tidiane, Female, 43 yrs old.

> *Demokaraasi* is to agree (*déggoo*), to form 'one.' Even if you are many, to be able to form a bloc and work together. To form one is to support one another, to discuss amongst yourselves. Even if concertation is difficult, you need to do all you can to reach a consensus.
>
> - Catholic unemployed teenager from Dakar, male.

> *Demokaraasi* means agreeing (*déggoo*).
>
> - Unemployed Mouride in town of Touba, male, 23.

> *Demokaraasi* is nothing other than mutual understanding. I argue with him, before leaving this place a third person will reconcile us (*jubalé*). And when we leave, the dispute is finished (*ñuy àndd*).
>
> - Mouride farmer from Mbacké, male, 43 years old.

> There is *demokaraasi* in Senegal because everybody is in agreement (*àndd*), people are content, everybody is talking about unity (*àndd*).
>
> - Chief of village, department of Coki; peanut farmer. Male, 65 years old.

These statements - from a diverse group of informants - share the sense that *demokaraasi* involves agreement. Yet in these statements, and in the Wolof language more generally, speakers distinguish different types of consensus. The following terms in particular are linked tightly to *demokaraasi*:

Déggoo: Formed from the root *dégg* (to understand) plus the suffix *oo* which denotes reciprocity and simultaneity, *déggoo* means "to agree, to reach an understanding." It connotes mutual understanding and absence of antagonism; a natural agreement flowing from intimate understanding of one another.

Juboo: Composed of the root *jub* (to be straight) and the suffix *oo*, *juboo* means "to reconciliate, to agree, to reach an agreement." Unlike the agreement achieved in *déggoo*, the understanding reached in *juboo* presupposes prior disagreement. What is important is the literal "straightening out" of differences.

Maslaa: From the Arabic term *maslahat* ("advantageous affair"), *maslaa* marks the establishment or maintenance of an outward appearance of consensus and civility despite the persistence of real disagreement below.[15] This term signifies a moral stance highly regarded within Wolof culture, where discretion (*sutura*) and honor (*ngor*) coexist as penultimate values.

And: This term means literally "to be or go together" and by extension it also means "to agree." The agreement connoted by *and* is reached in the spirit of solidarity; it entails going along with the majority for the sake of conforming. This type of agreement undergirds the following two Wolof proverbs cited by a peanut farmer to illustrate his understanding of *demokaraasi*:

> The Hyena says: "what everyone says - that is the truth." (*Bukki né ne "lu ñëpp wax mooy dëgg"*).

---

[15] On the Arabic origins of *maslaa* see Jacques Mouradian, "*Notes sur quelques emprunts de la langue wolof à l'Arabe*." In *Wolof et Sérère: Etude de phonétique et de grammaire descriptive* edited by Gabriel Manessy and Serge Sauvageot (Dakar: *Université de Dakar, Faculté des Lettres et Sciences Humaines, Publications de la section de langues et littératures*, 1963) p. 86. The creation of a public consensus that hides backstage controversy is also an important feature of political life among the Mende of Sierra Leone. See William P. Murray, "Creating the Appearance of Consensus in Mende Political Discourse." American Anthropologist 92,1 (March 1990) pp. 24-41.

> He who is in conflict with everyone else is the one who is wrong. (*Ku dëngo ak ñëpp ya dënga*).

The kind of agreement associated with *demokaraasi*, then, can take several forms. It may reflect deep mutual understanding; it may be the product of compromise ironed out between hostile camps; it may be a surface veneer that masks hidden discord; or it may arise from a desire to conform to social norms. The quality of the agreement matters less than the fact itself of having achieved some kind of consensus - a consensus that has come to be synonymous with *demokaraasi*.[16]

These connotations of consensus pull the concept *demokaraasi* from its moorings in Western political tradition. It is not that democracy cannot involve deliberation or have a consensual quality. Some critics of contemporary American democracy are attracted precisely to these ideas of consultation, deliberation, and consensus-building, and often incorporate them into models of "participatory," "direct," or "deliberative" democracy.[17] While consensus can be a part of the democratic process, however, few Americans would argue that democracy is, *tout court*, the achievement of agreement, which is exactly at times what the Wolof term *demokaraasi* has come to mean. In other words, shorn from *demokaraasi* are notions of governance that provide the context for

---

[16] Understanding that *demokaraasi* may mean agreement, whatever its form, sheds light on otherwise puzzling statements. A Dakar carpenter, for example, explained that:

> There used to be *demokaraasi* here in the days of colonial rule. The *Korité* prayer, for example, only took place once. When someone announced the time of prayer, everyone agreed. If everyone looks for the moon and sees it at the same time, that is *demokaraasi*.

Korité, it should be noted, is the Muslim holy day that marks the end of the fasting period called *Ramadan*. *Ramadan* lasts about one month, covering an entire lunar cycle. Korité begins at the first sight of the new moon. Several times, most notably in 1983 and 1991, leaders of the Mouride and Tidiane brotherhoods have disagreed as to whether the moon had indeed been spotted at the end of *Ramadan*, leading to the celebration of *Korité* on two successive days. One by the Mourides, the other by the Tidianes. For this carpenter, then, agreement among religious leaders typifies *demokaraasi*.

[17] See for example, Jane J. Mansbridge, Beyond Adversary Democracy. (New York: Basic, 1980). Carole Pateman, Participation and Democratic Theory. (Cambridge: Cambridge University Press, 1970). Hanna Pitkin and Sara Shumer, "On Participation." democracy 2,4 (Fall 1982) pp. 43-54.

deliberation and consensus-building in American theories of participatory democracy. Two friends who fight and then reconcile have achieved *demokaraasi*, but not democracy.

Viewed in this light, it appears that electoral competition may simply afford an opportunity for village solidarity to be reaffirmed. Indeed from Modou's perspective, *demokaraasi* was achieved in Thiourour the moment everyone ended up agreeing on a candidate. The act of choosing - for us the key element of democracy in his statement - seems less important. The essence of *demokaraasi* appears to lie in the final consensus achieved, and the social peace it ensured. Through the act of voting the villagers reinforced their ties of solidarity.

It is this community solidarity, and the mutuality and reciprocity that it entails - that seems to lie at the heart of many uneducated Wolofones understanding of *demokaraasi*. Consider the following statement of an elderly farmer from Ngabu, a Wolof village located about one hundred kilometers south of Thiourour:

> When there is work to do we come together to do it. When someone falls ill, we come together to cultivate his field. If something happens to one of us, everybody helps him out financially. When someone is sick, the women go to the well to fetch him water. That is our *demokaraasi* here in Ngabu.

A comment made by a Tidiane farmer from the Saloum region (the southernmost region of Senegal inhabited by the Wolof, some four hundred kilometers south-east of Thiourour) was strikingly similar:

> Our *demokaraasi* is everyone being unified. We do our work together. When it rains we do the same work. If someone is sick and can't cultivate his fields, we all meet to help him. To pay our taxes we all get together to give our money.

Another farmer from Ngabu explained what he thought the term *demokaraasi* meant:

> You are weaving a thatched roof for your hut. Here you can do it all out in the field. You place the frame on the ground, you put it together, you plait the straw. You do everything. But you can't lift it yourself. It is too heavy to pick up. You have to call someone to help you. You call one person, you call another. Together you all lift it up. That is our *demokaraasi*.

City-dwellers express comparable views. A Catholic woman explained to me why she thought *demokaraasi* no longer existed in her Dakar neighborhood:

> In the past everyone was united. It is not like that anymore. In the past, the city was not large; everyone knew each other. After Mass we visited each other, spoke with each other... People used to help each other.

For these people, the ideal of *demokaraasi* seems to involve the recognition of mutual dependence and the consequent importance of sharing responsibility for one another's well-being. What is interesting is how these people, like Modou, have moved outside the realm of electoral politics; all identify *demokaraasi* with a comprehensive form of community solidarity.

Often this solidarity is expressed in the idiom of the family. Many Wolofones say that *demokaraasi* means that everyone "shares the same mother and father" (in Wolof: "*bokk ndey bokk baay*"). The solidarity reflected by this phrase is grounded in the metaphor of the nation as family. This familial solidarity is meant to include all the people of Senegal who are commonly called *doomi reew mi* - literally "the children of the country" - a term which can also mean roughly "patriot" or "citizen." When political speechmakers address a crowd, they often begin by calling the assembled "*mbokk yi*" - literally - the relatives.

This cultural tendency of infusing political authority with parental images is echoed in the Wolof vocabulary of governance. One word for governing is "*boot*," the primary meaning of which is "to carry a child on a mother's back." The term may also mean "to cuddle or comfort," and carries strong connotations of nurturance. Extended to fathers, the term means "to support a family." In the political realm, *boot* means loosely "to govern" and carries the same connotation of parental or familial responsibility. The *njiit* assumes responsibility for the well-being of the *doomi reew mi* in the same way a mother does her child, or a father his family.[18]

Bokk ndey bokk baay, we might say, is roughly equivalent to our idea of "fraternity." Both encompass a range of connotations: tolerance, sharing the same values and goals, bonds of affection, and mutual obligation are among the most significant. What emerges from both metaphors is a picture of the nation as a community of siblings held together by ties of affection, responsibility, and commonly held ideals and purposes. Yet neither expression should be confused with any simple notion of equality, since both refer to feelings that arise out of a common <u>subordination</u> to parents.

---

[18] Similarly, the terms *yor* (to carry) and *uuf* (to hold in one's lap) may also mean roughly "to govern," and carry comparable connotations.

The interjection of the kinship metaphor also introduces hierarchy and authority.[19]

Beneath these similarities shared by "fraternity" and *bokk ndey bokk baay*, however, lie important differences. In Senegal almost half of all married Wolof men have more than one wife.[20] Many siblings share the same father, but not the same mother. *Bokk ndey bokk baay* refers to the especially strong ties that the children of the same father and the same mother feel. On this topic it is worth recalling that the meaning of most Wolof terms relating to siblings can be stretched wide. *Mag*, for instance, may refer not only to an older sibling, but also to an older cousin, or any elder whom one wants to address with respect.

The same is true of the indigenized French spoken in Senegal and the rest of Francophone Africa. In these countries *frère* is often a vague term which may, depending on the context, mean either 1) a male sibling who shares the same mother and father, 2) a male sibling who shares either the same mother or father, 3) any male member of the extended family, 4) any male member of the extended family in the same age group, or 5) any male with whom one feels ties of loyalty.[21] The point is that in this jumbled world of sibling terminology, the phrase *bokk ndey bokk baay* is unusually precise and emotionally potent.

The American concept of fraternity, in contrast, invokes a diffuse kind of affection more akin to the Franco-African concept *frère*. Like *frère*, our terms "brother" can be used to address not only male siblings, but friends and sometimes strangers as well, as in the Depression era song: Hey brother, can you spare a dime?

It is also important to note that the Wolof phrase is gender neutral; it does not harbor the masculine or uniquely brotherly overtones of fraternity. Indeed the Wolof language contains no words to translate exactly the concept of fraternity. Nor is there a term that refers to brothers in general. Siblings are classified first by age. One may have an older sibling (*mag*) or younger sibling (*rakk*). The older sibling may be male (*mag bu goor*) or female (*mag bu jigeen*) as can be the younger sibling (*rakk bu goor/rakk bu jigeen*). One word that is sometimes translated to mean

---

[19] On American notions of fraternity see Wilson Cary McWilliams, The Idea of Fraternity in America (Berkeley: University of California Press, 1973).

[20] Abdoulaye-Bara Diop, *La famille wolof: tradition et changement* (Paris: Karthala, 1985) p. 185.

[21] *Équipe IFA. Inventaire des particularités lexicales du français en afrique noire* (Paris: *EDICEF*, 1983) pp. 156-7.

"brother" is *càmmiñ*, but the use of this term is restricted to women.[22]

One consequence of this difference is that *bokk ndey bokk baay* is more inclusive than fraternity insofar as it includes siblings of both genders. The Wolof expression, however, reinforces images of inequality in a way that fraternity does not. In Wolof all siblings are classified immediately and automatically as older or younger. Not only is there subordination to parents, but a hierarchy among siblings reigns as well. The solidarity of *demokaraasi*, in short, is one graded by hierarchy.

The relationship of *demokaraasi* to hierarchy is complicated further by the fact that many Wolofones identify *demokaraasi* as containing something roughly equivalent to our notion of equality. People often allude to the type of equality associated with *demokaraasi* by calling up the Wolof term "*yemalé*" - a word that refers to an equality grounded in action; an equality that rests specifically on <u>treating</u> others equally.[23] One community leader in the city of Touba, for example, explained that:

> *Demokaraasi* is this: you put yourself at the same level (*yemalé*) as your peers. You wish for yourself what you wish for others. You wish for others what you wish for yourself.

When comparing *yemalé* with our English concept "equality," we find that equality in a social sense usually refers to a universal, equal status mandated by some abstract principle. Such principles may prescribe a level distribution of wealth (material equality), the uniform application of legal norms (equality before the law), the guarantee of an initial condition of sameness (equal opportunity), or the universal right to elect and be elected to

---

[22] The absence of a general term for brotherliness, incidentally, posed problems for Nineteenth century Catholic missionaries trying to generate a suitable Wolof vocabulary for Bible translation. At times it led them to coin less than elegant equivalents like *cofeel ga doomi ndey soppanté* (love that a mother's children feel for each other), *cofeel gu takku* (loyal love), or *déggoo bu mat* (complete understanding). See Le R.P V.-J. Guy-Grand. <u>*Dictionnaire Français-Volof. Précédé d'un Abrégé de la Grammaire Volofe*</u>. *Nouvelle Edition revue par le R.P.O. Abiven* (Dakar: *Mission Catholique*, 1923) p. 267.

[23] We can contrast "*yemalé*" with two other words - "*nawlé*" and "*moroom*" - that also denote equality, but which are not consistently used when talking about *demokaraasi*. *Nawlé* refers to people who share the same caste, and are thus equal in caste-status; while *moroom* refers to someone who is an equal in physical attribute or character.

office (political equality). The Wolof concept, in contrast, denotes an ethic of treating people as equals.

The key word here is "treating." *Yemalé* - and thus also *demokaraasi* - does not mandate that all are equal; hierarchies in age, gender, caste, and religious authority are respected. But it does require that a man treat his wives equally, that an Islamic marabout treat his *taalibés* (religious followers) equally, and that a mother treats her children equally. Consider, for example, this statement made by a religious teacher in the town of Coki:

> There is *demokaraasi* in the household because the father of the family treats everyone equally to maintain peace. If you are polygamous, you have to treat your wives equally in terms of food and clothes. That is what God ordered.

A farmer in Keur Moussa expressed a strikingly similar idea:

> *Demokaraasi* means that when you have two wives you have to do everything possible to avoid arguments in the household. If you have something, you need to distribute it equally.

Or take this assertion made by a farmer from the village of Darou Lo:

> The marabouts here in Senegal makes us live according to Islam, and Islam is *demokaraasi*. That is to say, our marabout Sëriñ Seex Lo gave birth to *demokaraasi* here in Darou Lo. Any villager is as much a child of Sëriñ Seex Lo's as the marabout's natural child. Today we sit on the same bed, we eat the same food, Sëriñ Seex Lo teaches us the same things, we have the same desires; the same things are prohibited to us both. Here, whatever we do, we do it together. Whatever is forbidden, we all forgo it together.

The son of a marabout explained *demokaraasi* in similar terms:

> *Demokaraasi* means *yemalé*. If you have two bowls for two people, if you intend to put food in one, you need to divide it up equally. One should not get more than the other. That shows that *demokaraasi* prevails, because you treated the two people equally. In Wolof we say that "The mother of twins lies on her back."[24] To permit each infant to suckle a breast as it likes, when it likes -that is *demokaraasi*.

---

[24] In Wolof: *Ndey ju seex, jaaxaanaay lay tëddee.*

These examples make clear that neither *yemalé* or *demokaraasi* require that an abstract, equal status reigns universally. What these concepts do require is that a caretaker or guardian treat those under his or her care or authority even-handedly, without partiality or favoritism - in spite of hierarchies of age that might exist between wives or siblings.[25]

To uneducated Wolofones, then, *demokaraasi* has come to mean in different contexts agreement, solidarity, reciprocity, mutuality and an ethic of evenhandedness. These meanings, it should be noted, do not emanate wholly from messages disseminated by the political elite. While notions of solidarity are contained in the image of *demokaraasi* as mosque projected by members of the ruling party,[26] unschooled Wolof speakers appear to reroot their understandings of *demokaraasi* in the moral ground of local community life - be it urban neighborhood or rural village. The result is what we might call a "folk" concept of *demokaraasi* that appears to differ in important ways not only from views of *démocratie* or *demokaraasi* generated by the French speaking elite, but also from our own American concept of democracy.

To argue that *demokaraasi* has been shaped in important ways by the material organization of Senegalese local communities is not, however, to endorse a view of crude economic determinism. Ideas are surely not a simple, mechanical expression of economic interests, as Weber would be quick to remind us. Nonetheless, notions of *demokaraasi* held by unschooled Wolofones do appear to be anchored in local social and economic conditions. To better grasp the meaning of *demokaraasi*, then, it may be helpful to examine in more detail the complicated relationship between economic structures and the formation of political ideas.

---

[25] It is worthwhile to note that *yemalé* also means to stop at a certain point as in the phrase "We'll stop the discussion at this point" (*Fii lënuy yemalé sunu waxtaan*). The term used in this way applies to the setting of not only temporal, but spatial and moral limits as well. The point is that *yemalé*, in all its uses, carries the connotation of placing constraints that should not be lifted or defining boundaries that should not be trespassed. These boundaries or constraints are at times self-imposed. *Yemalé* can refer to regulating what one says or acting with tact and discretion; thus a Wolofone might say a respectable man should *yemalé* (measure) his words (*Muskàllaf dafa war yemalé i waxam*). At the same time, some constraints are clearly imposed by a higher moral authority, be it husband, father, or marabout - in short by a *kilifa*.

[26] See Schaffer, "Political Discourse in Senegal."

* * *

In exploring the connections between material conditions and political concepts, it may help to step away from Senegal for a moment to examine a case which is closer to home - the complex relationship in the United States of market economy and liberal democracy. While I can here provide only a brief discussion of this subject, it will nevertheless provide a useful benchmark for comparing the Senegalese case.

It is telling that everyday talk of democracy in the United States is peppered with images derived from the marketplace. Students of American politics and citizens alike have come to regard politicians as commodities that are "packaged" and "sold."[27] Pundits and campaign planners speak of "wholesale" and "retail" politics.[28] Pushing this metaphor to its logical conclusion, some see citizens as political consumers, parties as brand-names, and democracy as a national bazaar.

The populism of Ross Perot evinces a slightly different mapping derived not from the market, but from the joint-stock company. "The United States is the largest and most complex business enterprise in the history of mankind...," he writes. "You and I are the shareholders of this country. We own it."[29] By this logic political officials are executive officers hired by citizen-owners, and democracy is a huge shareholder meeting in which the owners assert their control over management. Perot is not unique in this way of thinking. Faculty members at the University of Iowa established a political stock market (sanctioned by the Commodity

Futures Trading Commission) which, by August 1992, had attracted 550 investors who paid out $34,000 for Bush, Clinton, and Perot securities.[30]

Of course we use non-economic metaphors too. We sometimes speak of democracy as a dating ritual in which politician-suitors "court" and "woo" potential voters, and, if elected, usually get a "honeymoon period."[31] There is also a great tendency for Americans to speak of politics in terms of sports. Borrowing the language of horse-racing we speak of electoral "races," "running" for office, "running-mates," "front-runners," "shoo-ins" and "dark horse" candidates. Political analysts of the 1988 electoral campaign drew on images from boxing when they referred to each of the debates between vice-presidential candidates Bentson and Quayle as "rounds." They discussed who "won" or "lost" each debate and noted that Bentson delivered a "knockout punch" with his "you're no John Kennedy" quip. We also speak of political "lightweights" and "heavyweights." All this of course, takes place in the political "arena."[32] Democracy in America, it would appear from this set of metaphors, is a spectator sport. Prominent political actors compete as the rest of us watch.

Metaphors grounded in various aspects of our cultural experience, then, pervade our political language and thought. Market and investment metaphors are evidently not unique. Nor does everyone embrace these capitalist analogies unequivocally as positive models for democracy. To speak of political candidates as "products" that are packaged and sold evokes feelings of dissatisfaction and even disgust. The public's reaction to Ross Perot's candidacy is revealing on this count. Our fascination-revulsion with Perot may have something to do with the attractiveness of the stockholder metaphor and the unease its entailments impose. We are lured by the idea of a decisive, energetic CEO-President who can streamline the business of government, yet nagged by the awareness that actions fitting in a business environment may be inappropriate to democratic politics. At least one editorialist had something like this in mind when he wrote:

---

[32] On sports metaphors in American political language see William Safire, The New Language of Politics: A Dictionary of Catchwords, Slogans & Political Usage (New York: Collier, 1972).

> Perot intuitively grasps an essential part of what the presidency is about. He talks of action, of a desire to get things done, of executive energy.... [However], a political leader in a liberal democracy does not merely act; he must converse. He is not engaged in execution of a project, but in a dialogue with a plurality of interests, voices, and impulses.[33]

Still, these market metaphors hold a strong attraction for some social scientists. Perhaps the earliest was Joseph Schumpeter, who, in his 1942 classic Capitalism, Socialism, and Democracy, conceived of democracy primarily as a market mechanism for the delivery of political goods. By this view, voters are consumers who "spend" their ballots on political entrepreneurs who themselves compete with one another for the largest share of the political market.[34] Social scientists inspired by rational choice theories have since elaborated and adjusted this market model, conceiving of the voter sometimes as consumer, sometimes as investor.[35]

The assumptions that undergird our everyday market understandings of democracy are fleshed out and made explicit in these rational-choice inspired models of democracy. Integral to these models are postulates about human nature derived from the macroeconomic study of market behavior. One fundamental assumption is that the appropriate unit of analysis is the behavior of individuals - what Karl Popper called "methodological individualism."[36] Another fundamental assumption is that these

Gorman, Charles Phillips, and Jeffrey A. Smith, "What Have You Done for Me Lately? Toward an Investment Theory of Voting." American Political Science Review 70,3 (September 1976) pp. 779-805. Morris P. Fiorina, "The Voting Decision: Instrumental and Expressive Aspects." Journal of Politics 38 (1976) pp. 390-415.

[36] Popper states that the aim of a social theory based on the postulate of methodological individualism is "to construct and to analyze our sociological models carefully in descriptive or

individuals act in rational ways to maximize their self-interest. In the words of Anthony Downs, an early innovator in the field:

> We assume that every individual, though rational, is also selfish... Throughout our model, we assume that every agent acts in accordance with this view of human nature. Thus whenever we speak of rational behavior, we always mean rational behavior directed primarily towards selfish ends.[37]

To make his point, Downs reproduces approvingly the following statement of John C. Calhoun:

> That constitution of our nature which makes us feel more intensely what affects us directly than what affects us indirectly through others, necessarily leads to conflict between individuals. Each, in consequence, has a greater regard for his own safety or happiness, than for the safety or happiness of others: and, where these come in opposition, is ready to sacrifice the interests of others to his own.[38]

It would appear from these statements that by self-interest Downs means to point to selfishness and egoism.[39] Central to rational-

---

nominalist terms, that is to say, in terms of individuals, or their attitudes, expectations, relations, etc...." Karl R. Popper, The Poverty of Historicism (New York: Harper and Row, 1957) p. 157. See also Mark P. Petracca, "The Rational Choice Approach to Politics: A Challenge to Democratic Theory." Review of Politics 53,2 (Spring 1991) pp. 293-4. For a typical affirmation of the principles of methodological individualism in rational choice theories of democracy see Buchanan and Tullock, Calculus of Consent, p. 1. Karl Polanyi (not a rational choice theorist) traces this individualism directly to the historical rise of wage labor: "To separate labor from other activities of life and to subject it to the laws of the market was to annihilate all organic forms of existence and to replace them by a different type of organization, an atomistic and individualistic one." Karl Polanyi, The Great Transformation (Boston, Beacon Press, 1957) p. 163.

[39] More recent defenders of the rational-choice perspective, prompted by accusations of reductionism, have wished to disavow the equation of rational with egoistic motivations. As one advocate put

choice theories of democracy and the market metaphors upon which they are based, then, are individuals who maximize their self-interest, narrowly construed.

Critics of rational-choice models of democracy often argue that such assumptions ignore an entire range of non-selfish actions such as altruism, benevolence, and public service.[40] Even so, some critics acknowledge that the rational-choice model does accurately describe important features of how our democracy functions. For these critics the problem lies not in the model's lack of descriptive accuracy, but in the subtle transformation from "is" into "ought." Our present democracy may today be grounded in the behavior of self-maximizing individuals, they concede, but it should, and could, be otherwise. C.B. Macpherson, for instance, calls us to a form of participatory democracy, while acknowledging that:

> The substantial accuracy of [the model of democracy based on an entrepreneurial market analogy] as description may be attributed to the substantial accuracy of its

---

it: "'Rational' neither implies nor is implied by 'selfish.' Most of the attacks on the rational-choice method seem to me, therefore, to be entirely beside the point." Yet such disclaimers risk making the claim to rationality tautological. The problem is that rational choice theories are plagued by balloon-like notions of rationality and self-interest that are silently inflated (to include concern for the public good, benevolence and altruism) and deflated (to include only selfishness) without the theorist noticing. We might trace the origins of this problem to the "slipperiness" of the utilitarian foundations upon which rational choice theory is built. See Hanna Pitkin, "Slippery Bentham: Some Neglected Cracks in the Foundation of Utilitarianism." Political Theory 18,1 (February 1990) pp. 104-131. The above quote is from Iain McLean, "Rational Choice and Politics." Political Studies 39,3 (September 1991) p. 512. Similar statements can be found in Robert W. Jackman, "Rationality and Political Participation." American Journal of Political Science 37,1 (February 1993) pp. 280-1.

> assumptions about current Western man and society: as long as we have market man and market society, they can be expected to operate as described in [this model].[41]

Mark Petracca echoes these sentiments by pleading for a "transformation" of *homo economicus* into engaged citizen.

> What stands in the way of this possibility is the liberal individualism of contemporary political theory and practice, exemplified by the theories of rational choice. The assumptions of rational choice theory make it exceedingly difficult to develop a citizenry which thinks as a "we" when the entire project of social science inquiry is predicated on the politics of "I."[42]

Even these critics find something profoundly accurate about the description of democracy in market terms, and the view of citizens as rational calculators of self-interest.

In sum, the ways in which we think about democracy are bound by time and culture, and reflect important aspects of the economic system in which we today participate. The market analogy, and market-derived assumptions upon which it rests, have become central reference points in the debate about the current state of our democracy. Notions of the self-interested individual, democracy as market mechanism, and voter as consumer seem natural and obvious to some, or perverse and mistaken to others, precisely because our society is permeated so thoroughly by the market.

* * *

Let us now return to the African continent. In much of Africa - more to the point in Senegal - a majority of the population relates to the market differently. As a result of this divergence, notions of democracy that seem obvious to us make little sense to many unschooled Senegalese, who, as we have seen, have transformed Western political ideas to fit their own life-experiences.

The spread of market relations - so important in our own understanding of democracy - is noticeably restricted in much of Africa, including Senegal, where full participation in the market economy - with its fluctuating prices, high input costs, uncertain returns, and predatory state interventions - represents heavy risk

to rural cultivators and even to the urban poor.[43] This is not to say that these populations are self-sufficient; participation in the monetary economy provides essential resources to buy rice, tea, sugar, clothing, and household utensils, to pay taxes and school fees, and, for urban dwellers, to meet the costs of rent.[44] What it does mean is that rural and urban dwellers seek ways to cushion themselves from the vagaries of the market. Farmers and traders evade burdensome government controls by participating in informal markets beyond state reach. Farming households diversify their income by sending members of the household (like Souleymane, the younger brother of Modou) to work as wage laborers in the city.[45]

In addition to these market strategies, farmers also balance their crop mix by engaging part-time in safer activities such as subsistence agriculture. When the market for their produce is particularly depressed they may reduce commercial production sharply. One student of Senegalese agriculture describes how rural cultivators reacted to a difficult period of drought made more onerous by increased state demands for rural revenues:

> The peasants responded... by withdrawing from rural development services, intensifying non-compliance with administrative regulations and laws, and shifting peanut cultivation to subsistence farming. Beginning with the severe drought of 1968, government officials reported sharp increases in the production of millet for local consumption in acreage previously devoted to peanuts.[46]

Vulnerable populations also turn to a number of social strategies to assure a measure of economic security not provided by the market. Both rural and urban dwellers try to oblige themselves to a patron in the system of clientelism that permeates

---

[43] On state intervention in agricultural markets see Robert H. Bates, Markets and States in Tropical Africa (Berkeley: University of California Press, 1981). Michael F. Lofchie, "Africa's Agrarian Malaise." In African Independence: The First Twenty-Five Years edited by Gwendolen M. Carter and Patrick O'Meara (Bloomington: Indiana University Press) pp. 176-185. It should be noted that where profit incentives are strong, risks few, and government actions negligible or benign, urban and rural capitalism has in Africa expanded. The growth of cocoa farming in Ghana and southern Nigeria in the 19th century is a case in point.

[44] On this point see Nelson Kasfir, "Are African Peasants Self-Sufficient?" Development and Change 17,2 (April 1986) pp. 344-7.

the country's political, economic, and religious institutions. They also turn to networks of kin, friends, and neighbors.

In rural areas this may mean participating in cooperative work-groups (*xamba* or *kompin* in Wolof) that work the fields of local notables in exchange for money or goods - resources that are used to ease the burden of costly ceremonies such as weddings and baptisms. These cooperative groups will also work a member's field if he or she falls ill, or help in arduous tasks such as house-building. As one anthropologist noted, the function of these groups is to "provide mutual aid in labor and economic 'insurance' for their members."[47]

Urbanites have their own cooperative groups. Muslims belong to urban religious associations known as *dahira* which, beyond their narrow religious aims, also collect fees from members which are put aside for the purpose of mutual assistance.[48] Women often belong to neighborhood mutual-aid groups called *mbootaay* which collect contributions from their members to be used on an at-need basis in times of emergency or to organize familial ceremonies.[49] Another type of association known as *mbaxal* collects money from members to finance regular get-togethers.[50] City dwellers also take part in rotating credit associations known as *tontines* which provide each member in turn a sum of money that would ordinarily be beyond his

or her possibilities.[51] *Tontines*, *mbootaay*, *mbaxal*, *dahira* and similar associations do not, however, merely satisfy short-term financial needs.[52] They serve to solidify a wide web of social bonds that may be counted upon in future times of trouble. One researcher with long-experience studying women's associations in Dakar observed:

> What counts is the circulation of money through neighborhoods or social networks under various pretexts: familial ceremonies, gifts, loans, economic activity. This fluidity of money permits the formation of alliances, to multiply one's partners and to diversify sources of income.[53]

Thus even in urban areas, market activity is not the sole means of survival. Indeed unique reliance on individual economic activity may threaten one's welfare:

> ...counting exclusively on individual economic activity leads to a rupture with one's solidarity network, to isolation, to inertia and impasse. In contrast, to multiply one's contacts, by enlarging the social networks in place through continued investment in relationships, constitutes a more sure guarantee of survival in the peri-urban environment.[54]

Putting all one's resources in market activity is risk-laden, it appears, not simply because of fluctuating prices and state interference. Many Senegalese must balance any potential gains from the monetary economy with the risk of loosening or severing the social bonds which form their safety net. That is, it may be hazardous to act in one's narrow self-interest if it means neglecting social obligations to kin, neighbor, and patron.[55]

[55] In surveying a wider literature on Africa Lemarchand makes a similar point. See René Lemarchand, "African Peasantries, Reciprocity and the Market." *Cahiers d'Études Africaines* 29,3 (1989) p. 58. My reading of James C. Scott, The Moral Economy of the Peasant: Rebellion and Subsistence in Southeast Asia (New Haven: Yale University Press, 1976) and Goran Hyden, Beyond Ujamaa in Tanzania: Underdevelopment and an Uncaptured Peasantry (Berkeley: University of California Press, 1980) have also

We can begin to see how different these strategies are from the behavior of the self-interested individual so central to our own notions of democracy. In Senegal, individual behavior is embedded deeply within a wider web of social relations. Opportunities and risks associated with actions - economic or otherwise - are seen through the cultural lense of one's relations to kin, friend, neighbor, and patron.

Recall, for a moment, the description that Calhoun offered of the market-defined, self-interested individual:

> "Each... has a greater regard for his own safety or happiness, than for the safety or happiness of others: and, where these come in opposition, is ready to sacrifice the interests of others to his own."

Now contrast the reasons an elderly farmer offered for voting for Abdou Diouf in the 1993 presidential elections even though he was a strong supporter of Diouf's main opponent, Abdoulaye Wade of the PDS:

> I voted for Diouf because of my relatives and the people with whom I live in this village. Before the elections, everyone got together and decided to vote for Diouf. I voted for him out of respect for that decision.

When his interest in seeing Abdoulaye Wade elected and the interest of the community clashed, his own gave way. Motivated by deference to his family and neighbors, he implicitly acknowledges the powerful moral obligations imposed on him by the network of reciprocal social relations to which he belongs.

Another farmer acknowledged these social bonds when discussing the merits of private voting booths:

> Voting in front of people is not good for everyone. When I go to the polling station both my child and my nephew are there. One is member of the PS and the other a member of the PDS. I greet each one, and they each pay their respects to me. I can't then jump up, take my ballot, and support my nephew only to abandon my child. Nor can I get up and support my child only to abandon my nephew. So I go behind the curtain, take my ballot, put it in an envelope, place it in the ballot box, and go on my way; nobody knows for whom I voted. The fact is that family ties are so important to us Wolof that we wouldn't dare offend any of our kin; their anger would wound us.

---

influenced this discussion.

He preferred to use voting booths because the discretion they offer minimizes potential conflict and maintains kinship harmony. His familial ties provide the prism through which he comprehends his ballot-casting.

It should, perhaps, be stated explicitly that these webs of reciprocal social relations are incorporated within a broader pattern of moral obligation. These bonds are of course functional insofar as they are essential strands in the community safety net, but they are also objects of respect and consideration. The upkeep of these bonds is a matter of loyalty (*kollëré*), honor (*ngor*) and dignity (*fulla*).[56] These bonds are, in short, embedded in what we might call a "communitarian ethic."

The point of all this is the following: the folk concept of *demokaraasi* by all appearances has been absorbed into this communitarian ethic. That is, understanding *demokaraasi* as reciprocity, concerted action, solidarity, and impartiality seem to emanate from this culture-bound set of norms and values.

As a result, many Senegalese citizens have come to see participation in the electoral process as a form of morally sanctioned social exchange that serves to assure a minimum level of well-being. Sometimes the benefit is immediate and tangible, as when political patrons offer money or food in exchange for votes. Consider how an elderly woman living in the poor Medina neighborhood of Dakar responded when I asked her whether there was *demokaraasi* in Senegal:

> Yes, there is *demokaraasi* here. The Socialist Party chose a local elder to be the delegate for this neighborhood. Everything that he gets from the party, be it rice or sugar, he shares with us. Whenever I have a family occasion he gives me money.

The essence of *demokaraasi* for this woman seems to lie not in choosing her representative to the government - but in the benefits this delegate brings home.

To some, this kind of clientelist transaction may call up images of the machine politics that dominated the cities of post Civil War America, or the clientelism that today defines the electoral systems of Italy, Mexico, and any number of other Asian,

---

[56] Boubakar Ly, *L'Honneur et les valeurs morales dans les societés oulouf et toucouleur du Sénégal*. (*Thèse du doctorat du troisième cycle*, University of Paris, 1967) pp. 285-326. Sylla, *Philoaophie morale des Wolof*, pp. 170-182.

African and Latin American countries.[57] In a recent, widely reported case, candidates in Thailand's September 1992 general elections openly bought up votes from rural Thais for 50 baht, or about two dollars, apiece.[58]

But this Senegalese woman's statement is striking because it suggests that vote-buying in Senegal is not seen as an aberration, corruption, or perversion of *demokaraasi*. Whether or not similar beliefs are held in other Third World countries, such is not a common view in the United States. Politicians in the US engage in machine politics for sure, but scarcely anyone would argue that this is the essence or ideal of democracy; it represents, rather, the baser side of our political life - indeed we call it political "corruption," a departure from what is pure and right. For many Senegalese who think like the old woman from Medina, in contrast, the exchange of food for vote between political patron and client is the ideal, the paragon of *demokaraasi*.

If the benefits accrued from participation in the electoral system are sometimes immediate and tangible, at other times they are more diffuse, serving instead to reinforce the bonds of solidarity necessary for collective long-term security. Consider again what Modou had to say:

> A while ago there were two politicians who were candidates for office. When they came to this village, we got together and asked each other "which candidate do you prefer?" Some chose the first candidate, others the second. When we saw the first candidate had more support, those who had initially chosen the second candidate immediately joined the majority to make things run better. That is our *demokaraasi* here in this village.

The essence of *demokaraasi* for Modou appears to lie in the final unanimity achieved, and the social harmony it ensured. Through the act of voting the villagers reinforced their ties of solidarity, and strengthened their safety-net.

At the same time elections endanger *demokaraasi* and the communitarian ethic of which it is part by threatening to splinter community solidarity with the factiousness and divisiveness of clan rivalries. For this reason, some Senegalese prefer not to participate in elections at all. As one farmer explained:

---

[57] See for instance, Harold F. Gosnell, Machine Politics: Chicago Model, 2nd edition (Chicago: University of Chicago Press, 1968). Schmidt et al., Friends, Followers, and Factions.

[58] New York Times, September 13, 1992, p. 7.

> I didn't vote for anyone in these past elections because I am a *njiit* in this village. I only watch and observe because I don't want to alienate anyone. Elections cause relations between people to deteriorate. I remain neutral. Everyone likes me and everyone respects me. When I tell people to do something they do it. So I don't side with any political party. I don't want to in conflict with anyone, be it the elders or the young people. Everyone trusts me. The women's association always asks my advice. The youth association too - whenever they have to send a representative somewhere, they delegate that responsibility to me. In our village you can't separate voting from other aspects of life. When there is a baptism you see everyone. If there is any kind of village event everyone participates.

Discord, jealousy, and distrust are all found within urban and rural communities. They can be intense, and as we mentioned earlier, even deadly. Elections, viewed from this perspective, provide the occasion for *demokaraasi* to be either strengthened or subverted by furnishing both an opportunity for solidarity to be reaffirmed and presenting a risk that it will be shattered.

If *demokaraasi* sometimes entails voting and involvement in the electoral process, the idea that individuals have a say in the way that public affairs are governed is often absent. Indeed, *demokaraasi* does not require voting or involvement in the electoral process at all. Any type of aid or solidarity that ensures economic security counts as *demokaraasi*. One farmer explained how bureaucrats employed by parastatal agricultural agencies were at one time the main vehicles of *demokaraasi*:

> Long ago we had *demokaraasi* here in Senegal, and it was useful. We were poor; government agents helped us when the rains were bad. When the seeds were distributed, they gave them to us on credit, to be paid back after the harvest. This form of aid was our *demokaraasi*. But that no longer exists now. They use us then throw us aside in the same way an insect gnaws at a peanut. Us farmers, we want *demokaraasi* because if we can work together, everyone will be happy. If we pull together our desires and thoughts God will help us. You need to come together, be like a bundle of sticks tied together; like this nobody can do anything to you.

And as we saw earlier, any type of village reciprocity - helping the sick or hoisting a roof - also implies the existence of *demokaraasi*. Voting is only one strategy among others for its realization.

Because economic welfare and *demokaraasi* are so closely linked, it may not be coincidental that images of sharing or

portioning food have become important metaphors for *demokaraasi* - be it the mother of twins who lies on her back to allow each infant to suckle, or the host who apportions food equally between two bowls. One Bayfall *taalibé*[59] had these connections in mind when he explained:

> You, me, getting along with one another is all that we want. The person who doesn't want that isn't worthy of being called human. There is no one in Senegal like that. Take you - you're white, we're muslims, but we accept you as one of us. If you had come during lunchtime, we would have eaten together. Yes, we would have shared our bedrooms with you. We wouldn't have given it a second thought. You see, this eating together, this sharing is typically Senegalese. If you arrive somewhere you say "peace unto you," the host replies "come eat." This has always existed here. And it is this that has created *demokaraasi*. Yes, take the beggar - he goes around with his bowl asking for food. Any house he goes to they give him rice. That is pure *demokaraasi*.

Pure *demokaraasi* means giving on demand to someone who has nothing to offer back. It is a willingness to share, even if one gets nothing in return. It is not by chance that the *taalibé* used the idiom of food to convey this idea; for people living precariously close to hunger, sustenance is the bottom line. Food is an important metaphor for *demokaraasi* because an important purpose of *demokaraasi* is to assure material security through mutual community assistance.

* * *

Demokaraasi, it should be noted, has an opposite. Mutual trust betrayed, reciprocal obligations ignored, social bonds abused and *demokaraasi* thwarted are, in Wolof, called *politig*, a term that derives from the French noun "*politique*." How this came to be requires a brief explanation.

Like the French word *politique* the Wolof term can mean many things, depending on the context. Several of its meanings resemble

---

[59] The Bayfalls are a sect of the Mouride brotherhood that believe that work in the service of a marabout may substitute for prayer. A *taalibé* is a follower of an Islamic marabout. In this case, the bayfall *taalibé* lives with and works the fields of his marabout.

closely those of its French progenitor.[60] *Politig* for instance, often refers in a general way to the activities of governments, political parties and leaders in much the same way that the French word does. Additionally *politig*, like the French *politique*, can also mean policy. We can, for example, translate both "*la politique agricole*" and "*politigu mbëy*" as "agricultural policy."

Yet Wolof speakers, even those who speak no French, draw a sharp distinction between French and Wolof meanings of *politig*. A farmer living in a village without a single French-speaking resident explained that:

> In French, *politig* means that those in power do all that they can to create good, to bring together intelligent people to lead the country. But in Wolof *politig* is a foul word. We think immediately of deception. If you say something that seems false, we say that you are trying "to *politig* us." *Politig* is to lie, to trick.

A non-Francophone farmer from a different village expressed similar ideas:

> *Politig*, in French, means to build the country. *Politig* in Wolof is different. I go to a tailor. Instead of sewing my shirt with tight, solid stitches, he does shoddy, careless, *politig* work; work that should have been done well, but is done poorly, intentionally so.

Where Wolofones attribute to the "French meaning" of *politig* a range of positive connotations, the "Wolof meaning" is strongly pejorative, denoting a variety of dishonest or deceitful behaviors.

Many Senegalese associate this Wolof meaning of *politig* with the self-serving lies politicians have the habit of telling in search of votes and support. A tailor offered the following allegory about politicians:

---

[60] The French term "*politique*," can be used in a variety of contexts. It can be used as a feminine noun "*la politique*" as well as a masculine noun "*le politique*." In its feminine form, we can distinguish at least two different usages. It can be used to mean "line of conduct" or "policy" as in the phrases "*la politique coloniale*" (colonial policy) or "*la politique de gauche*" (left wing policies). In other contexts it carries the connotation of involvement in public life as a career or activist. Thus we might translate the French "*faire de la politique*" to mean "to be a political activist" or "to be in politics (as a career)." We can also identify two different usages of the masculine form of the term - "*le politique*." It can refer to a person involved in "*la politique*" as a career (a politician). It can also mean "politics, the political side of things."

> I will explain to you what *politig* is: when their car breaks down they call you, ask you to push it, and promise you a ride in return. When it starts, they wave goodbye and drive away. You are left standing in the road.

The reference is to how politicians make false pledges when asking for votes, with no intention of giving anything in return to their electors. They manipulate voters' expectation of reciprocity and solidarity for their own egoistic advantage. Central to *politig* is this underhanded exploitation.

Members of the Senegalese political elite are well aware of these pejorative meanings of *politig*. Several intellectual and politicians I interviewed thought its origins dated to the late 1940s or the early 1950s, when the French colonial administration extended suffrage to all adult Senegalese. It was a time when politicians began campaigning for the first time in rural areas, and made wild promises to peasants unlearned in the workings of the new electoral system. Evidence shows that *politig* was indeed used in its pejorative sense at that time. In a 1950 party journal one political commentator discussed the unique meaning of *politig*, or as he spelled it, *poleutique*:

> In Wolof, the word "*politique*" does not have an equivalent. The corresponding word is "*poleutique*," a term which does not find its origins in any African dialect, and is in fact derived from the French word. This word "*poleutique*" has, and can only have, a pejorative meaning. It signifies wiliness and insincerity; a game dominated by guile, a game in which the most cunning dupes the most foolish; a game one needs to know how to escape. The Wolof has a good laugh when one tries to make him understand that *politique* is a social service destined to guarantee the primacy of the general interest, to ameliorate the material conditions of the masses, to transform the face of the country. He has only seen men that today find black what yesterday they presented as white; men who, if the occasion arose, would tell you without batting an eyelid that nobody is infallible, and continue, in spite of this, to fatten himself on the stupidity of his neighbor. All this, in time, had conferred great credibility on the bamboozlers and professional hoodwinkers who know how to bellow in front of crowds and shed tears out of pure "*poleutique*."[61]

---

[61] Amadou Abdoulaye, "*Politique ou poleutique*." Condition Humaine, 28 March 1950, p. 1.

Yet references to a particularly Wolof understanding of *politig* date back much farther. In 1914 a Mulatto merchant named Louis Pellegrin, a candidate in the legislative elections of that year, wrote:

> In 1896 I returned to the colony I had left when I was four years old..... I noticed at once that our old colony was still in its childhood and that the *politique* that was applied to it seemed to be purely administrative. To give you an idea of the impression held by the native-born of the old *politique*, consult with me the Wolof language. The word "*politique*," taken from French means in Wolof: circumlocution, lies, falsehoods."[62]

At this time electoral competition was restricted to Europeans, Mulattos, and a limited number of African living in the four communes (the cities of Dakar, Gorée, St. Louis and Rufisque). In 1914 a total of 4,863 people voted, and only a fraction of them were Africans. The process of electing leaders, then, engaged only a tiny number of urban Africans. The vast majority of urban and rural Senegalese - that is to say the mass of Wolof speakers - were excluded. Thus the *politig* known to most Wolof speakers at this time was likely to be closer to what we would call "policy" than to "electoral politics." It appears to have been the policies of colonial administrators, rather than the practices of indigenous political candidates and elected officials, that were pocked with lies, deceit, and circumlocution.[63]

Wherever its origins lie, what is interesting about this Wolof word *politig* is how it has been extended today to a wide range of

---

[62] *Profession de foi de M. Louis Pellegrin, commerçant* à *Louga*. 26 April 1914 Legislative elections. *Archives Natonales du Sénégal*. 20G-21.

[63] Pellegrin seems to confirm the preponderance of policy in the turn-of-the-century colony when he writes that the *politique* that had been applied was "purely administrative." Yet Pellegrin's assessment may have been self-serving. As a candidate for elected office, it was, if nothing else, expedient for him to reproach appointed colonial administrators. Certainly there was plenty of deception in the turn-of-the-century Senegalese electoral competition. The 1908 legislative elections, for example, were annulled, in part, because one of the French candidates made the fraudulent promise to his African electorate that he would rescind all house taxes when elected mayor; something only the governor had the authority to do. See G. Wesley Johnson, Jr., The Emergence of Black Politics in Senegal: The Struggle for Power in the Four Communes, 1900-1920 (Stanford: Stanford University Press, 1971) pp. 117 & 121. François Zuccarelli, *La vie politique sénégalaise (1789-1940)* (Paris: CHEAM, 1987).

contexts. Indeed Wolofones use *politig* pejoratively in situations that we would not consider to be political at all. As we saw above, a tailor can do "*politig* work." Or consider an artisan who tries to pass off as gold a ring made of brass. In Wolof the ring would be called a "*politig* ring." In this context *politig* means fake or phoney. A Dakar jeweller explained:

> The way I see it, *politig* means hidden lies. If I take a ring, and I want to use it to *politig* you, I will tell you that the ring is gold while it is really brass. That ring, you can sell it for 5000 cfa, even though it sells for only 10 cfa in the market. In our eyes that is *politig*.

The use of *politig* here places the emphasis on the injurious intentions of the seller who has broken the bonds of trust with his client. "To *politig*" is to abuse the confidence someone has placed in you. It refers to any act the purpose of which is duplicity and betrayal.[64]

All this suggests that how Wolofones distinguish what "is *politig*" from what is "not *politig*" looks very different from how we distinguish what counts as politics from what does not. The boundaries that divide "the political" from "the nonpolitical" for us anglophones cannot be transposed easily onto the Wolof conceptual map.

Part of the difficulty lies in the fact that our notion of the political is closely connected to the public/private distinction so important to liberalism, a set of beliefs that arose in the 17th and 18th centuries as a growing, economically autonomous bourgeoisie demanded political rights from the crown to protect its newly accumulated property and the free market relations by which its new wealth was acquired.[65] The challenge of liberalism was to justify the carving out a space protected against the intrusion of the state. As the doctrine took form, the distinction between public and private became central. At the heart of this distinction is the idea that the individual has natural rights (such as a natural right to property) which exist independently of government, and which ought to be protected against government. Liberal

---

[64] Contrary to popular opinion in Senegal, the Wolof term *politig* is not unique in meaning any kind of exploitative lie or trick. In the africanized French of Zaire and Camaroun "*la politique*" can also refer to any kind of lie or deception. In Rwanda "*les politiques*" has come to mean gossip or false rumors. See *Équipe IFA, Inventaire des particularités lexicales du français en afrique noire*, p. 299.

[65] Barrington Moore, Jr., Social Origins of Dictatorship and Democracy (Boston: Beacon, 1966) pp. 413-432.

political thinkers thus conceived of two realms - the private realm of individual freedom secured by each individual's natural rights; and the sphere of public action in which individuals interact (consent, vote, make social contracts) with other individuals as political equals. In this set of distinctions, both democracy and politics belong to the public realm.[66]

Concern about drawing a sharp public/private distinction is less accentuated in Senegal, where the impulse to acquire wealth privately and individually is balanced, as we have seen, by a need to develop and sustain a wide network of kin and friends. Webs of interdependence blur the boundaries surrounding private and public. More salient is the distinction between actions that undermine solidarity (and by extension collective security) versus those that promote it. *Politig* belongs to the former category, and *demokaraasi* the latter. A farmer summed up the situation well:

> For us Wolof, *politig* is a vile word because it means to fool, to exploit, to betray. But *demokaraasi* is a good thing. It strengthens the country. It is something that can lift a person up, support him. If we are together today and you do not treat me with fairness (*yemalé*), in the future if you call me I will refuse to come to your aid. If I hoard my peanuts and you hoard your peanuts, and you try to steal from me and I try to steal from you, we will end up with nothing, or worse. If we put our peanuts together we will have a great pile, enough for all. That is the difference between *demokaraasi* and *politig*.

---

[66] It should be noted that liberalism has been criticized for linking the political so tightly with the public. Those concerned with gender equality, for instance, point out that what goes on in the private, personal realm is also political. To these critics, what is essential is not the division between the (public) state and the (private) economy, but between that which is hidden and domestic and that which is public and political. They argue that liberalism hides the fact that the two spheres are intimately connected. Liberal principles cannot simply be extended to women, these critics maintain, because their full and equal membership is impossible without changes in the domestic sphere. They thus argue that the patriarchal basis of liberalism must be addressed in its own right. See Carole Pateman, "Feminist Critiques of the Public/Private Dichotomy." In Feminism and Equality edited by Anne Phillips (Oxford: Basil Blackwell, 1987) pp. 103-26. See also Anne Phillips, Engendering Democracy (University Park, PA: Pennsylvania State University Press, 1991) pp. 92-119.

* * *

The realization that *demokaraasi* (and *politig*) mean something quite distinct from their English-language rough equivalents suggests an interesting dilemma for those of us interested in the serious comparative study of democracy. The dilemma is similar to that confronted by the careful translator. Take, for example, difficulties inherent in translating our concept "argument." Argument, in the English language, is constructed metaphorically as a kind of battle. As two linguists wrote in a recent book:

> It is important to note that we don't just talk about arguments in terms of war. We can actually win or lose arguments. We see the person we are arguing with as an opponent. We attack his positions and we defend our own. We gain and lose ground. We plan and use strategies. If we find a position indefensible, we can abandon it and take a new line of attack.[67]

Now these linguists invite us to:

> Try to imagine a culture where arguments are not viewed in terms of war, where no one wins or loses, where there is no sense of attacking and defending, gaining or losing ground. Imagine a culture where an argument is viewed as a dance, the participants are seen as performers, and the goal is to perform in a balanced and aesthetically pleasing way. In such a culture, people would view arguments differently, experience them differently, carry them out differently, and talk about them differently. But *we* would probably not view them as arguing at all: they would simply be doing something different. It would seem strange even to call what they are doing 'arguing.'[68]

It would indeed seem strange to call what these hypothetical people are doing "arguing." And I am suggesting that it would seem strange to call the practice that most Senegalese are engaging in "democracy." The crux of the matter is this: the adoption of institutions we normally associate with democracy - legislatures, a plurality of political parties, free elections and the like - does not mean that people understand or make use of these institutions in ways that we would consider democratic. Many Senegalese are engaged in a different game, with rules of their own making.

---

[67] George Lakoff and Mark Johnson, Metaphors We Live By (Chicago: University of Chicago Press, 1990) p. 4.

[68] Ibid., pp. 4-5.

The concept *demokaraasi* may involve the casting of ballots; in that way it bears a close resemblance to our concept of democracy. But *demokaraasi* also consists of several loosely connected ideals that pull this concept away from its American cousin. Notions of reciprocity, consensus, solidarity, and an ethic of treating people evenhandedly make *demokaraasi* a concept that stands first and foremost for economic security and social harmony. Its opposites are disruption, discord, exploitation, egotism, and greed - in short, *politig*. Democracy, in contrast, embodies above all else notions of self-rule, of people ruling themselves or at a minimum having a real say in how they are ruled; its opposites are authoritarianism and oppression. If democracy sometimes requires public demonstration to ensure that "the people's voice to be heard," those who hold *demokaraasi* as an ideal abhor fractious protest. If democracy requires an open and non-corrupt political system in which political goods are distributed under some system of impartiality, *demokaraasi* means providing goods to clients and supporters. If democracy implies that citizens make up their own minds on public issues, *demokaraasi* requires following the lead of higher moral authorities. If democracy is about governance and public life, *demokaraasi* is about collective survival and the material well-being of the community.

These differences point to important implications for how we understand what we call "political behavior" in Senegal. Practices that may seem to us undemocratic (e.g. buying votes) or simply not relevant to democracy (giving alms to a beggar or hoisting a roof) are constitutive of *demokaraasi*.

If we take these insights seriously then we cannot assume that a tide of "democracy" has washed over the globe, as many scholars seem to believe. Strictly speaking, no Wolofones discuss the merits of their "democracy;" there are no popular cries for "democracy" in China; and no intellectuals in the Czech Republic calling for a quickened pace of "democratic" change. Wolofone citizens of Senegal participate in *demokaraasi*, Chinese students demonstrated for *minzhu*, and Vaclav Havel is attempting to institute *lidovlada*. Accordingly, the image of democracy as a levelling wave would best be left to the cartoonist.

Liberal notions of democracy, then, may not always be easily transplanted. Local communities assimilate Western ideals selectively and transform them to fit their own life-conditions. Equating *minzhu*, *lidovlada*, or *demokaraasi* with democracy is problematic because the cultural premises that infuse our own practices and institutions may not be universal. We thus need to make explicit the presuppositions of our own behavior as well as those of the Chinese, Czechs, and Senegalese.

Political Discourse in Senegal: From *Démocratie* to *Demokaraasi*

Fred Schaffer
Department of Political Science
University of California at Berkeley

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

This paper examines how Western political ideals have been integrated into the political culture of Senegal, a country which boasts one of Africa's oldest multiparty political systems. It focuses specifically on problems that arise when political leaders attempt to translate French ideas into Wolof, the dominant indigenous language of the country. French concepts such as *démocratie* or *politique* that developed on European soil have no direct equivalents in Wolof. Yet post-colonial forms of governance have required political leaders to develop a new political vocabulary, created by either projecting traditional Wolof words into the new political context, or by borrowing vocabulary from French and Arabic. These projections and loans, however, carry with them meanings embedded in local history and culture - meanings that shape the population's understanding of its own political practices, ideals, and institutions.[1] This paper explores how these hidden connections have distorted the intended messages of political leaders, and have had the unintended consequence of creating a Wolof hybrid concept - *demokaraasi*.

The linguistic landscape of Senegal, like that of many post-colonial countries, is tiered. French is the language of officialdom and the acculturated elite. Wolof is the native tongue of almost half of Senegal's population, and the country's lingua franca. And still another five major languages are spoken. This multiplicity of languages complicates an analysis of political concepts in Senegal. Different language groups have different political vocabularies. Political ideas garnered through the medium of French may thus differ in important ways from those uncovered in Wolof, Serer, Diola, or Pulaar.

To complicate matters more, language choice for the country's bi- and multi-lingual population varies with social and linguistic context. Take the case of one typical Serer family living in Dakar. Linguists found that while the parents speak Serer to one another and to their pre-school aged children, the father addresses the older children in French. Amongst themselves, the children use

---

[1] Examples of this phenomenon in other African languages are found in Pierre Alexandre "Some Linguistic Problems of Nation Building in Negro Africa" in Language Problems of Developing Nations edited by J. Fishman, C. Ferguson, and J. Das Gupta (New York: John Wiley, 1968). Henry L. Bretton, "Political Science, Language, and Politics" in Language and Politics (The Hague: Mouton, 1976) William M. O'Barr & Jean F. O'Barr. Wilfred H. Whiteley, "Political Concepts and Connotations: Observations on the Use of some Political Terms in Swahili" in African Affairs 1 edited by Kenneth Kirkwood (Carbondale, Ill.: Southern Illinois Press, 1961).

Wolof.[2] Other researchers have noted that school children speak French in the classroom, but Wolof in the school yard.[3] Legislators who speak French on the floor of the National Assembly or in meetings with fellow deputies may well switch to Wolof when conversing with their peers in less formal settings or when addressing their constituents. Doctors working with bilingual psychiatric patients at Dakar's Fann Hospital observed that language use varied with emotional state. A patient, for instance, who normally spoke Wolof with his family switched to French following each psychotic break.[4] Language choice, in short, varies with the formality of the social setting, relations of power, and even state-of-mind.

A study of Wolof political concepts thus faces numerous difficulties, not the least of which is the fact that a large number of Wolof political terms are of French origin. Unfortunately, we don't know the particular conditions under which many of these terms entered the Wolof language. Wolof is primarily a spoken language, and apart from a few dozen lexicons and dictionaries written by explorers, traders, Catholic missionaries, and colonial administrators in the 18th, 19th and early 20th centuries, there is scant written record of how the language adapted to the arrival of the French.

One of the few attempts to study these early written sources was carried out by Pierre Dumont, who analyzed the French loan words contained in a 1902 Wolof-French dictionary. He identified 142 loan words, many of which belonged to specialized domains like seafaring or Christianity. None, however, related to politics.[5]

Yet by the early twentieth century, a number of Africans had become participants in French-style politics. As part of a broader policy of assimilation, the French had extended citizenship rights to a substantial number of Africans living in the coastal towns. By the early 1900s these new voters were sufficiently numerous that politicians courted their votes aggressively.

One advantage enjoyed by African candidates over their French competitors was that they could address African audiences in Wolof. During the 1914 elections many rallies for the African candidate Blaise Diagne were held at least partially in Wolof. Diagne himself spoke both Wolof and French while his lieutenant Galandou Diouf pleased the crowd with his eloquent Wolof oratory.[6] Yet Diouf's Wolof was not pure. An observer at one rally in April 1914, for example, noted that a number of French words peppered his speeches, among them: *vote*, *droits*, *liberté*, *commandant*, and *commis*.[7] Whether Diouf's non-French speaking audiences understood these terms is uncertain. We do know, however, that at least one French word was well-integrated into Wolof at this time - *politique*. Indeed Wolof speakers identified an understanding of *politig* that was uniquely Wolof: it meant simply to lie or deceive. As one Wolof-speaking candidate in the 1914 elections wrote at the time, "the word '*politique*' taken from French means in Wolof: circumlocution, lies, falsehoods."[8] I could, however, find no conclusive proof that the term *démocratie* had entered Wolof discourse by the early twentieth century even if the French word *démocratie* was used widely in debates on colonial policy at this time.

The French origins of the Wolof term *demokaraasi* - whatever the historical details - presents a set of puzzling questions: Where, exactly, should we draw the borders between the "Wolof" concept of *demokaraasi* and the "French" concept of *démocratie*? Is it enough to say that the word, uttered in a Wolof sentence, is *demokaraasi* while spoken in a French sentence is *démocratie*? Does meaning change when the word is transferred from French to Wolof?

The notion that there is a uniquely Wolof concept of *demokaraasi* would today be questioned by many Senegalese intellectuals. In conversation, several academicians expressed to me their open skepticism that the uneducated majority of Senegalese had any coherent understanding of the concept at all. This concern is hardly frivolous, given the high rates of illiteracy and almost total absence of broad-based civic education. Indeed while most Wolof speakers I interviewed - even those in the remotest villages - were at least vaguely familiar with the term *demokaraasi*, I did encounter individuals who did not have a clear notion as to what the word might actually mean. One old woman, for instance, told me with some exasperation: *demokaraasi*... I don't know what it is exactly, it's just some word I hear a lot on the radio." Other intellectuals doubted whether there was anything unique in how the

---

[6] *L'AOF*, 21 March 1914, p. 1; 9 May 1914, p. 1.

[7] *L'AOF*, 21 April 1914, p. 3.

[8] *Profession de foi de M. Louis Pellegrin, commerçant à Louga.* 26 April 1914 Legislative elections. *Archives Natonales du Sénégal.* 20G-21.

Wolof understand *demokaraasi* - even taking issue with calling this a Wolof term at all. For them, there is no Wolof concept *demokaraasi*, only the French term *démocratie* spoken with a Wolof accent. That is, the words differ in pronunciation, not meaning.

The cumulative weight of these considerations - the existence of different language groups, variance of language use by context, and fuzzy boundaries between French and Wolof - make it necessary to isolate and explore political discourse in well-defined settings. In this paper I propose looking at how one segment of Senegalese society - the political elite - makes use of the terms *démocratie* and *demokaraasi* in the public discussions and debates that take place in newspapers, conferences, party organs, radio broadcasts, and political meetings.

Because the term "political elite" is used widely yet inconsistently in social science literature, a few words of explanation are in order to clarify what it will mean in this study. By political elite, I mean those people who either exercise important governmental functions: top civil servants, government ministers, members of the national assembly; or who contribute actively to national political debate and policy formation: journalists, high-level educators, and leaders of opposition parties, civic associations, and labor unions.[9]

This paper will explore how the members of the French-speaking political elite in Senegal speak of *démocratie*, what channels they use to disseminate their views to the wider population, and how the meanings of this concept shift when political leaders are compelled to develop a new vocabulary and set of metaphors to convey messages to the non-francophone population. The aim is to see how and where French discourse on *démocratie* shades into Wolof discourse on *demokaraasi*.

1. *Démocratie*: French language debates

The return to multiparty politics in Senegal after 1974 ushered in a new era of political debate. Previously illegal and semi-clandestine political groups engaged in open political activity. They challenged the political status quo and sought to alter the very rules of political competition, which they perceived

---

[9] For a more detailed sociological description of Senegal's political elite see Gilles Blanchet, *Elites et Changements en Afrique et au Sénégal* (Paris: Orstom, 1983). I exclude from my definition of political elite the leaders of the Senegal's Muslim brotherhoods who, although they exert strong pressures on government officials and party leaders, rarely engage openly in public political debates beyond making vague calls for national unity and peace. For a different view see Christian Coulon, "Political Elites in Senegal." Mawazo 2,3 (June 1970) pp. 9-22.

to be skewed in favor of the ruling party. These challenges persist to this day, and the rules of the new political game have not yet been fixed. The constitution has been revised seven times since 1974, and the electoral code more than fifteen, most recently in 1992. For this reason, the various factions of Senegal's political elite today see the country's *démocratie* as open-ended and still emerging.

Some members of the political elite conceive of this emergence in biological or developmental terms. A recurrent theme in speeches of President Abdou Diouf over the years, for instance, is how Senegalese *démocratie* is either youthfully adolescent or maturely adult, depending on his political needs of the moment. Thus when Diouf assumed power in 1981, and lifted restrictions placed by the former President Léopold Senghor on the number of parties that could legally be created, he declared that "having achieved the age of adulthood, with the 21st anniversary of our independence, our democratic system has to refine, reform, and improve itself."[10] Yet when Diouf wished, four years later, to justify the slowness of democratic reform, he portrayed Senegalese *démocratie* - and African *démocratie* in general - as having reached only the youthful age of adolescence, and therefore bearing the limitations and promises of its age. In his own words:

> African *démocratie* is a young *démocratie*. It thus has the weaknesses of its youth. But it also has energy, enthusiasm, faith, without which nothing durable or grand could be built.[11]

While opposition leaders do not usually speak in these biological terms, certain parties have, nonetheless implicitly adopted this metaphor. The *Convention des Démocrates et Patriotes* (CDP), for instance, adopted the Wolof name "*Garab gi*" or "medicine." This party, created by the historian Iba Der Thiam in June 1992, proposed to cure Senegalese *démocratie* of its ills. *Démocratie*, in this metaphoric scheme, is a natural body that not only ages and matures, but also succumbs to sickness or recovers good health.

Other Senegalese intellectuals see *démocratie* in engineering terms, as something to be erected or constructed. Ousmane Tanor Dieng, the President's *Directeur de Cabinet*, wrote an article in homage to the "architects of our *démocratie*" who laid "the cornerstones of the democratic model that we want to build and to

---

[11] Quoted in *Le Soleil*, 2 July 1985, p. 3.

perpetuate."[12] Some independent observers believe the opposition - in particular the strong *Parti Démocratique Sénégalais* (PDS) - wants simply to tear down the *démocratie* built by the ruling *Parti Socialiste*. Members of the PDS, in contrast, see their role in a more positive light:

> The kind of *démocratie* that we have and want to build has never, anywhere in the world, issued from an "experiment" conducted by one man for the benefit of the people. Everywhere it has been a laborious undertaking - constraining, often bitter and sad - but always exalting the different components of an active nation.... But this *démocratie* will work because it rests on solid institutions....[13]

Certain opposition figures place less stress on the construction of a new edifice than on maintaining the one already built. Madior Diouf, the Secretary-General of the *Rassemblement National Démocratique* (RND) campaigned in 1993 as the presidential candidate who would clean up the sullied building of *démocratie*, a promise that did not go unnoticed by cartoonists who unfailingly portrayed him with broom in hand during the campaign period.

Engineering and maintenance metaphors of *démocratie* are in tension with those that depict an aging natural body. Envisioning the political actor as architect, engineer, or custodian implies that political society is created and sustained by human artifice, while the image of an aging organic body underscores the naturalness of the *Senegalese* political community. Furthermore, if images of architect or engineer imply that Senegalese *démocratie* needs to be redrawn or rebuilt, images of biological development or building maintenance underscore the need to ensure continuity. Thus images of biology, engineering, and housekeeping contain tensions - tensions inherent in politics and attempts to change the political world: political society is natural and artificial; it is subject to continuity and change. Yet despite these tensions, these metaphors share the sense that Senegalese *démocratie* is unfolding, in progress, in the process of becoming. The debate is over the future, about how to move Senegalese *démocratie* forward on its developmental path, how to cure its ills, how to strengthen and build on its foundations, how to clean up the refuse that sullies it.

In more concrete terms, debates about Senegalese *démocratie* stem from disagreements over whether political competition has been fair, and whether elections have been transparent. Virtually every

election since the return to multiparty rule in 1974 has taken place amidst opposition accusations of fraud and unfairness. Nonetheless, the opposition appears committed to what we might call the democratic game. Indeed the recent defeat of ruling parties in other African countries has provided strong proof to the Senegalese opposition that a more robust multiparty *démocratie* is possible in Senegal, but that it requires a legal framework that can guarantee fair competition.

Because the very rules of the political game are in contention, debates about Senegalese *démocratie* have been heated. Leaders of each party have their own ideas about the steps needed to secure it foundations, restore it to health, or scrub it clean. The specifics of the debate have, nonetheless, shifted with time. From 1974 - the year that President Senghor initiated the return to multiparty politics - to his resignation in 1981, debate over Senegalese *démocratie* centered around Senghor's controlled liberalization of the political system. At the heart of this scheme was a revised constitution that provided for three political parties representing three constitutionally defined ideological positions. The governing *Union Progressiste Sénégalais* (UPS) - the forerunner of the *Parti Socialiste* - specified itself as "socialist and democratic" leaving a position open to its right for a "liberal and democratic" party and one to its left for a "Marxist-Leninist or Communist" party. In 1978 a constitutional amendment created a "conservative" slot, bringing the total of recognized parties in this system of limited multi-party rule to four. These openings were filled by well established Senegalese politicians heading parties that were already (somewhat clandestinely) organized.

During this period, the debate about *démocratie* was dominated by opposition figures who headed parties denied legal recognition by the new constitution. They argued that restricting electoral competition to parties that reflect only a narrow range of political opinions - defined by the President no less - placed artificial and arbitrary limits on Senegalese *démocratie*. Babacar Niang, at the time a leader of the RND, called the new constitution "quasi-monarchical"[14] while Mamadou Dia, a former President imprisoned by Senghor in 1962 and future founder of the *Mouvement Démocratique Populaire* (MDP), wrote that:

> The constitutional reforms of 1976-1979 pretend to open an era of *démocratie*: in reality they have the effect of confining and walling in *démocratie*.... The law on the ideological traditions and the organization of parties has instituted a limited pluralism (3 then 4 parties) permitting the government to choose <u>its opposition</u>, to remove from public life those associations that are most

---

[14] Babacar Niang, "*Quelle démocratie pour le Sénégal?*" <u>Taxaw</u> (April 1977) p. 9.

> representative of public opinion. It arbitrarily freezes in place the political structures of Senegalese society without prior public consultation.[15]

The unrecognized political organizations thus saw the reforms as despotic measures manufactured to divide the opposition, marginalize the most significant forces for political change, and arrest the development of *démocratie*.

President Senghor defended himself vigorously against these accusations. To him, there was no contradiction between selective legalization and *démocratie*. Indeed some restrictions on political activity was essential to assure the balanced growth of *démocratie*.[16] As one of his defenders explained a few years after the President left office:

> The very principle of limiting the number of political parties is compatible with the exigencies of *démocratie*, because the proliferation of parties could, under certain circumstances, engender anarchy and lead to dictatorship. Furthermore, limited multipartyism constituted at the time an undeniable progress of *démocratie* in an Africa that seemed devoted to single party regimes. It had, in addition, the advantages of forcing the political class to propose clear programs, and of blocking the formation of parties based on narrow group interests or parties that pursued only narrow electoralist ends. Furthermore, once one accepts the principle of limited multipartyism, the Senegalese technique of limitation based on ideological traditions presents itself as the least unjust solution, and the one which is most likely to guarantee true political pluralism.[17]

Unlimited pluralism, then, risked chaos. The steady progress of *démocratie* required the channeling and restriction of political activity.

The PDS, seeking to preserve its privileged position as the leading legalized opposition party, approved of the limitations placed by Senghor on the number of officially recognized political parties. As an editorialist for the PDS journal Le Démocrate wrote:

---

[15] Mamadou Dia, "*L'État et la démocratie*." Andë Sopi (September 1979) p. 8. Emphasis in original.

[16] Léopold Sédar Senghor, *Léopold Sédar Senghor: La Poésie de l'Action. Conversations avec Mohamed Aziza* (Paris: Stock, 1980) p. 226.

[17] Jacques Mariel Nzouankeu, *Les partis politiques sénégalais* (Dakar: *Éditions Clairafrique*, 1984) p. 33.

> It is entirely normal that political life be regulated because, as we have always maintained, multipartyism should not be a savage pluralism where each citizen hears the voices like Joan of Arc or de Gaulle, and creates his own party. Even in competitive sports, not everyone who wishes to be a participant can become one, otherwise this would result in anarchy and there would be no game. That is to say that certain restrictions are desirable, even if we can argue about the acceptable number of political parties.[18]

While the PDS supported limited pluralism, it disputed the highhanded manner in which Senghor designated the parties to be legalized. The PDS believed that such a decision should be made not by the whim of the President, but by public referendum.[19]

The debate of the late 1970s, then, was dominated by the question of whether the exclusion of various political organizations from electoral competition expanded *démocratie* by staving off dictatorship and forcing the legalized political parties to represent a wider general interest, or constricted *démocratie* by arbitrarily denying recognition of parties that represented views of large segments of society. In 1981 the terms of the debate shifted dramatically. Senghor resigned, passing the presidency to his groomed successor, Abdou Diouf. Diouf, upon assuming office, opened up political competition by amending the constitution to provide for the legal recognition of all political groups regardless of ideology. By January 1982 Senegal counted 14 opposition parties. Elections were held in 1983; Diouf and his party won overwhelmingly, albeit under charges of fraud and irregularity by opposition leaders.

After the 1983 elections, any doubts that the PDS was the dominant opposition party were put to rest. The PDS presidential candidate Abdoulaye Wade received eight times the vote of the other three opposition candidates combined. It was clear that the PDS was singular in its organizational vigor and ability to present a real challenge to the ruling party. Because of this strength the PDS played a leading role in defining the debate on the future of Senegalese *démocratie* through the 1980s. It disputed the legality

Translation appears in Robert Fatton Jr., The Making of Liberal Democacy in Senegal: Senegal's Passive Revolution, 1975-1985 (Boulder: Lynne Riernner) p. 9.

[19] Desouches, p. 63; Fatton, p. 9.

of an arguably biased and flawed electoral system persuasively, and requested reforms that appeared on the whole quite reasonable.

Among the more important reforms sought by the PDS were a series of measures intended to make electoral fraud more difficult: an independent electoral commission to take the place of the Ministry of the Interior in handling the administration of elections; publication of returns for each polling station (rather than for the whole department) to make verification of the results possible; the right of parties to name representatives to each polling station; and a requirement that all electors show identification before being allowed to vote. In addition, the PDS pushed to extend voting rights to citizens between the ages of 18 and 21, and to those living abroad. The PDS believed it had strong support among both groups, and that these citizens had been excluded to guarantee the electoral advantage of the ruling party. Another reform called for by the PDS was equal access to the state media. In the 1983 elections, PS legislative candidates received as much air-time as all the opposition candidates combined. The PDS has also pressed for the right to form coalitions between parties that wish to present a common list of candidates. Laws prohibiting such coalitions, it argued, prevented the opposition from presented a serious, unified challenge on election day. The PDS also called for a return to secret voting. After 1976 the use of private voting booths became optional, allowing the PS to apply coercive pressure on voters.[20]

By presenting a seemingly fair and reasonable reform project, the PDS compelled the leaders of the PS to articulate a defense of the electoral system put in place by Senghor and Diouf. This defense addressed the PDS' claims point by point. PS leaders argued, for instance, that the prohibition of coalitions served to prevent any "instability" and "insecurity" that might result from a shaky governing coalition. As for the optional use of voting booths - this practice ensured each voter's liberty of free expression and, moreover, conformed to traditional practices of public voting. They also contended that requiring voters to produce identification would lower voter turn out and waste time at the polling stations. To the ruling party, in short, the electoral code was eminently fair and democratic.[21]

The dispute between the PS and opposition reached a climax in 1988. In presidential elections held in February, Abdou Diouf was declared a winner, despite widespread allegations of fraud and

irregularity. Opposition parties banded together to contest the results and urban rioting broke out. The government responded by jailing several opposition leaders and declaring a state of emergency that lasted for months.

These events forced the President to reappraise the electoral code. He eventually concluded that future social peace hinged upon consensually achieved reform. Thus in 1991 he announced the creation of a commission to draft a new code. The commission, composed of representatives of each party and a magistrate, negotiated and approved a new code within a year. This code integrated many of the reforms put forward by the PDS and other opposition parties, including restoration of the obligatory use of voting booths, required presentation of voter identification, lowering the voting age to eighteen, and legalization of party coalitions. Most importantly, the new code gave each political party the right to supervise, monitor, and participate at various stages of the electoral process.[22]

The February 21, 1993 presidential election was the first to take place after the promulgation of the new code. Almost 1.5 million voters went to the polls to choose among eight presidential candidates. The leading contenders were the incumbent Abdou Diouf, and Abdoulaye Wade, Diouf's longtime adversary. With the exception of a few violent incidents in the Casamance, election day was calm. Announcement of the results, however, was delayed due to sharp disagreements which developed among members of the National Tabulation Commission (NTC) - a body composed of representatives of each candidate and a magistrate from the Court of Appeals. Representatives of opposition party candidates called for the annulment of results issuing from several of Senegal's thirty-one departments,[23] alleging fraudulent use of special voting "ordinances" by PS supporters. After two weeks of deadlock, the NTC passed its responsibilities on to the Constitutional Council, the final arbiter of electoral disputes. On March 13th, the Council declared Abdou Diouf the winner with 58 percent of the vote; Abdoulaye Wade came in second with 32 percent. Many supporters of Wade and other opposition candidates - concentrated in Senegal's largest urban areas of Dakar and Pikine - contested the validity of these figures, and acted out their frustration in the days that

[23] Senegal is divided administratively into ten regions. Each region is composed of three departments. Thus there are thirty departments in Senegal. For the purposes of these elections, the Commune of St. Louis was separated from the department of Dagana and designated as a "fictive department," bringing the total number of departments to thirty-one.

followed with acts of violent protest and vandalism. To the dismay of Abdou Diouf, the new code failed to restore the confidence of many disaffected urban dwellers in the integrity of the electoral process.

Another major initiative undertaken by Abdou Diouf in response to the crisis of 1988 was the inclusion of two opposition parties - the PDS and the *Parti de l'Indépendence du Travail* (PIT) - in a government coalition. During its short life span (May 1991 to October 1992) participating parties lauded this coalition as a breakthrough for Senegalese *démocratie*.

Among excluded opposition parties and independent-minded intellectuals, however, this development caused apprehension. They feared that it threatened to diminish the role of the electorate in public life by transforming elections into simple gauges of party strength to be used by leaders in backroom negotiations over power and privilege.

Through the 1980s and into the early 1990s, then, the major debates concerning *démocratie* centered on the scale of electoral fraud, reform of electoral rules, and the impact of governance by coalition. To the opposition the overarching issue has been the unfairness of an electoral system created and operated by the ruling party. To them, the only real proof of electoral fairness would be the removal of the ruling party through the ballot box. The definitive prerequisite of movement towards true *démocratie* would thus be party turnover, or as it has come to be called in Senegal "*alternance*." In speaking about the "defects of Senegalese *démocratie*," Abdoulaye Bathily, the Secretary-General of the *Ligue Démocratique-Mouvement pour le Parti du Travail* (LD/MPT) said recently that:

> The institutions, as they are now, exclude all possibility of political *alternance*. The same party is in power since independence. As long as we don't have free and transparent elections... Senegalese *démocratie* will remain an illusion.[24]

One leader of the PDS put it more succinctly: "Without democratic *alternance* there is no *démocratie*."[25] *Démocratie*, for the opposition, requires not only free elections, but ultimately *alternance*.

[25] Fara Ndiaye, radio and television broadcast, 1983 electoral campaign. February 1983.

It follows that members of the opposition and other critics of the government view Senegal as a *démocratie* laggard that was surpassed in 1991 by such African countries as Cape Verde, Benin, and Zambia; each of which saw electoral victories by the opposition. The experience of these countries is, as one journalist put it, "the most explosive proof that *alternance* is not a utopian dream in Africa."[26] If *alternance* is the measure of *démocratie*, then Senegal is clearly not a front-runner. As one Senegalese commentator remarked, "African countries until now reputed to be backward are providing superb lessons, threatening to relegate Senegal to the last rank of idlers."[27] To certain critics, Senegal not only lags behind its African neighbors, but has regressed vis à vis its own past democratic achievements. Abdoulaye Wade, for instance, wrote in 1986 that:

> Contrary to other African countries, Senegal has practiced multiparty rule and liberty of press for over a century and a half.... that is why the present situation, for the Senegalese people, constitutes a movement backwards in relation to its own democratic traditions.[28]

Whether the reference point is its own historical performance or the accomplishments of other African countries, to would-be reformers, Senegalese *démocratie* is in a dark state of stagnation or regression.

The ruling party, not surprisingly, sees the situation in rosier hues. To it, Senegalese *démocratie* is a path-breaking achievement which might serve as a model to be emulated by other African countries. One PS journalist, for instance, wrote that the introduction of multiparty rule in 1974 "is today an uncircumventable historical reference point on the continental atlas."[29] Other PS leaders have called Senegalese *démocratie* a

"beacon" and a "unique experiment"[30] that has permitted the country "to have played, from the point of view of *démocratie*, a pioneering role."[31] One PS cadre went so far as to write that Senegal today serves as the shining example of *démocratie*, "a role formerly filled by Athens and Greece where *démocratie* was born."[32]

To make such claims, of course, leaders of the PS have had to delimit carefully what they mean by *démocratie*. One thing it seems not to entail is routine *alternance*. Or, in the opaque wording of one PS leader: "*alternance* must not come to signify automaticity."[33] Yet in a country that has never seen party turnover, the distinction between periodic *alternance* and the principle of *alternance* is deprived of practical significance. By attacking automaticity, the PS is maligning *alternance* as a mechanism of democratic governance. The idea of *démocratie* propagated by PS intellectuals has thus come to represent a form of truncated multipartyism in which party leaders are allowed to trumpet their programs and agendas, but not displace the ruling party. This understanding is not, it should be noted, static. PS leaders have deftly adjusted it to meet changing needs. During the duration of the PS-PDS-PIT union these same leaders argued that there are means other than *alternance* to provide political parties access to political power - namely by integrating them into a government coalition. It was above all else for this achievement that they felt justified in calling Senegalese *démocratie* an exemplary, albeit unfinished model.

All this should make clearer how current debates about the meaning of *démocratie* are grounded in political struggles between a hegemonic single party seeking to legitimize its long-standing rule and an opposition striving to discredit it. It should also elucidate how different factions of the political elite can agree that Senegalese *démocratie* is "under construction," so to speak, yet disagree so sharply about how to proceed: while opposition leaders see the pressing necessity of fairer electoral competition and *alternance* as means to renovate a shaky edifice, PS officials have proposed governance by coalition as one way to build on the already solid foundations of *démocratie*.

2. Channels of Dissemination

Debates over *alternance*, multipartyism, and governance by coalition are shaped primarily by party leaders, government officials, and influential intellectuals who are for the most part university educated. The factions of the Senegalese elite have much at stake in how the broader population comes to understand *démocratie*. It would be hard for the incumbent party to justify its continued rule should the electorate come to embrace *alternance* as a central component of *démocratie*. On the other hand, opposition parties have a compelling interest in broadening the people's understanding of *démocratie* beyond notions of truncated multipartyism. For this reason, political parties expend great amounts of energy disseminating their particular views of *démocratie*. To gauge how effective these efforts are, it is important to examine how exactly ideas of *démocratie* get disseminated to the wider population. What are the channels of diffusion? Who do they reach? In this section we will examine four important channels: the education system, the print and electronic media, and political rallies.

A. <u>The Education System</u>

The formal public education system provides the state with an important potential medium for familiarizing future voters with political ideas and concepts such as *démocratie*. It also affords the ruling party an opportunity to propagate ideas of *démocratie* advantageous to its interests.

Political education in the Senegalese school system takes place principally in civic education classes. The law mandates that primary schools offer civics classes to children roughly aged nine to eleven.[34] At this level, students get exposed to concepts such as "nation" and "state," and learn basic information about the constitution, different branches of government, and international organizations such as the United Nations and the Red Cross.[35]

Children who advance to secondary school receive instruction that is both broader and more detailed. This instruction takes place during the first "cycle" of secondary school, designed for adolescents usually aged between thirteen and sixteen. This first cycle is divided into four levels - the sixth, fifth, fourth, and third, for students aged thirteen, fourteen, fifteen, and sixteen respectively.

---

[34] Children spend two years at each of the *Cour Elementaire* (CE) and *Cour Moyen* (CM) levels. Most students in the CE level are nine to ten years of age; most students in the CM level eleven to twelve.

[35] *Décret n° 79-1165 du 20 décembre 1979 portant organisation de l'Enseignement élémentaire.*

At these levels, teachers generally use civics textbooks prepared by the Ministry of Education. The topic of *démocratie* is treated only in the fourth level textbook, which contrasts democratic regimes with monocratic ones, and explains in some detail the operation of Senegal's electoral system as of 1980, the date the book was published.[36] Since the electoral code and constitution have been modified several times since then, the discussion of the Senegalese political system is in many respects outdated. Schoolteachers sometimes improvise and supplement this book with their own knowledge and materials. The quality and content of instruction is thus uneven.

How many children are exposed to civics education, whatever its content? Although primary school education is compulsory, most children do not attend classes. Less than half of all 7 year-olds have enrolled annually in educational institutions in recent years.[37] The children that do enroll come overwhelmingly from urban areas. In 1988 over 90 percent of 7 to 12 year-old urbanites attended school, against only 34 percent from rural areas, where the majority of the country's population lives.[38]

Enrollment rates in secondary schools drop steeply. Only 30 percent of 13 year-olds are enrolled in any given year; for 15 year-olds it is a mere 2 percent.[39] These depressed rates explain the overall low number of Senegalese who have a post-primary school education - less than 500,000 in 1988, more than half of whom live in the region of Dakar, and 85 percent of whom live in urban areas.[40] As a percentage of the total adult population, my best estimate is that only about 9 percent of the country's 2.8 million

[40] *Republiqe du Sénégal. Ministère de L'Economie et des Finances. Direction de la Statistique. Bureau Informatique. Recensement general de la population et de l'habitat, mai-juin 1988: Resultats definitifs*. Dakar: 1990. Table 4.04.

population aged twenty or older has above a primary school education.[41]

These figures suggest that those citizens who received an education about *démocratie* in secondary school civics classes are few and concentrated in Dakar and a few other urban centers. Civics education, then, is not only of varying quality and content, but also available to only a few Senegalese.

B. The Print Media

The vying factions of the political elite have at their disposal today other channels to disseminate their particular views of *démocratie*. The French-language print media affords one of them. The *Parti Socialiste* publishes an array of monthly, bimonthly and quarterly organs and journals in which articles on *démocratie* appear regularly.[42] Also included in this list must be the state-owned daily newspaper *Le Soleil* which, while not legally under the control of the PS, nonetheless provides an important platform for the views of the ruling party. Opposition parties put out their own party organs, with varying degrees of regularity.[43] Discussions of *démocratie* also appear frequently in privately-owned newspapers without formal ties to any political party.[44]

---

[41] According to the 1988 census, the total number of people with post primary education in 1988 was 427,145. According to the Ministry of the Education there were 161,713 secondary school students in 1988, who were presumably counted in the 427,145 figure. That leaves roughly 265,000 voting age adults who have a secondary education. *Recensement general*, tables 3.01, 4.04. *Tableau de bord*, pp. 3 & 5.

[42] These publications include the central organ of the PS, *L'Unité pour le socialisme*; the central organ of the enterprise committees of the PS, *Combat pour le socialisme*; the journal of the movement of socialist women, *Ndab li*; the journal of the Study and Research Group of the PS, *Perspectives Socialistes*, and a new publication entitled *Le Débat*.

[43] Published weekly is the organ of the *Parti Démocratique Sénégalais*, *Sopi*. Appearing on newsstands less frequently are the organs of the *Ligue Démocratique-Mouvment pour le Parti du Travail* (*Fagaru* and *Jallarbi*), *Parti de L'Indépendance et du Travail* (*Daan Doole*), *Rassemblement National Démocratique* (*Taxaw*), *Parti pour la Libération du Peuple* (*Reew mi*), and *Mouvement pour le Socialisme et L'Unité* (*Yaakaar*) to name a few.

[44] The most established of these papers are the dailies *Wal Fadjri* and *Sud au Quotidian*, and the weekly *Le Témoin*. Two satirical newspapers in the tradition of France's *Le Canard Enchainé* also appear weekly: *Le Politician* and *Le Cafard Libéré*.

As this brief survey suggests, different factions of the Senegalese political elite churn out a plethora of journals, papers, and organs. The impact is, nevertheless, constrained by a weak distribution system. The *Agence de Distribution de Presse* (ADP) -a subsidiary of the French group *Nouvelles messageries de la presse parisienne* - maintains a virtual monopoly over the distribution of most national and international publications.[45] ADP does not, however, distribute papers widely outside of Dakar and its satellite city Pikine. Beyond these areas, distribution follows the major roads and does not reach far beyond thirty of the country's largest towns and major coastal tourist centers. Even the largest urban areas possess only a fraction of the number of distribution points found in greater Dakar. Dakar and Pikine together count over one hundred distribution points while the next largest city in Senegal, Thiès, has only three.

As a result, the majority of papers are sold in the Dakar region. *Le Soleil*, for example, sells only 25 percent of its papers outside the capital city despite the fact that more than 80 percent of the country's population lives outside the capital and its satellite cities. The percentage for independent newspapers and party organs is even smaller.[46]

One reason for the restricted distribution of print media is weak demand: the number of people living outside the Dakar region possessing the French-language skills necessary to read the papers is low.[47] It makes little economic sense for the ADP to maintain a

---

[45] Bara Diouf, "*Le Soleil et son destin?*" *Mondes et cultures* 47,3/4 (1987) p. 529. Monique Pagès, "*L'Explosion de la presse en Afrique francophone au sud du Sahara.*" *Afrique Contemporaine* 159 (1991) p. 79.

[46] This information was provided by the Sales Manager of ADP in March 1993. The situation in 1993 has not evolved much from that reported by a researcher in 1981. See Dominique Gontier, "*La presse écrite de Langue Française et la Francophonie au Sénégal.*" Part 1. *Réalités africaines & Langue Française* 14 (April 1981) pp. 61-73. Dominique Gontier, "*La presse écrite de Langue Française et la Francophonie au Sénégal.*" Part 2. *Réalités africaines & Langue Française* 16 (January 1983) pp. 25-48. It should also be noted that several independent papers, frustrated by what they perceive to be an unduly high commission rate charged by *ADP* (36 percent of selling price), have on several occasions tried to establish alternative distribution networks. A lack of adequate funding, however, dashed these attempts. Babacar Touré. "Senegal: The Price of a Free Press." The UNESCO Courier (September 1990) pp. 24-26.

[47] According to the most recent census data, only 26 percent of the country's population aged six years or older are literate in French. This figure hides the fact that the highest rates of

far-reaching national distribution network to cover the almost 200,000 square kilometers of the country when the majority of people capable of reading a French language paper are concentrated in an area of 550 square kilometers.

Even in this small area the distribution of papers is lopsided. Kiosks and hawkers are concentrated in the downtown administrative and commercial center of Dakar and in middle- and upper-class residential neighborhoods a few kilometers up the peninsula. Areas with high concentrations of less affluent consumers (such as Pikine, Thiaroye, Guédiawaye, Grand Dakar, or Medina) have only a fraction of the number of distribution points.[48]

The sale of newspapers is concentrated in areas where bureaucrats, businessmen, and managers work and live. It is this segment of the population that possesses not only the linguistic skills needed to read the papers, but also the money to buy them. Indeed demand is quite price-sensitive in Senegal: when the selling price of the daily *Le Soleil* increased a few years ago from 100 to 150 CFA (from about 33 cents to 55 cents), circulation dropped by about 30 percent. Cost as well as literacy limits demand.

The dual constraints of cost and literacy are reflected in the low circulation of virtually every periodical. The paper with the largest circulation is *Le Soleil*. It has a circulation that has hovered in recent years between 25,000 and 40,000 - this in a country of more than seven million people. *Sud Hebdo* is typical of the more established independent newspapers. It has an average press run of 10,000, and usually sells a little more than 80 percent of the total copies printed. The various party organs have press runs that range from 3,000 to 8,000 copies. Even allowing for

---

literacy are found among the youngest age groups. Of voting age adults - the likely readership of these papers - only 19 percent are literate. These francophones are concentrated in the largest urban areas. 53 percent of all adult francophones live in the Region of Dakar that includes the cities of Dakar, Pikine, and Rufisque. Literacy rates for the population (aged six years and older) living outside the seven major urban areas of the country (the Departments of Dakar, Pikine, Rufisque, Kaolack, Dagana, Thiès, and Ziguinchor) run at only 14 percent; literacy among adults runs even lower. *Recensement general*,tables 1.03, 4.06, 4.07.

[48] Based on data provided by ADP Sales Manager in March 1993. See also Gontier, "La presse écrite..." Part 1, pp. 65-70.

the fact that one paper may be passed around and read by several individuals, circulation still remains quite restricted.[49]

While the problem of cost cannot be eliminated easily, political parties, government agencies, and independent publishers have made sporadic attempts to overcome the barriers posed by high rates of French-language illiteracy by publishing journals, pamphlets, and newspapers in Wolof, a language understood by an estimated 80 to 90 percent of the population.

The majority of these publications are written in Wolof transcribed with the Roman alphabet. Among the earliest of the publications was the 1970s publication *Kaddu*, a monthly journal of politics, culture, and history published by the film-maker Ousmane Sembène and the linguist Pathé Diagne. Other Wolof periodicals include *Xamlé*, a journal put out by the State Secretariat for Human Promotion in the early 1980s, and *Sofaa* a bilingual Wolof-Pulaar newspaper that the Association of Senegalese Researchers began publishing in 1988. Additionally, several French-language party-organs have, over the years, carried occasional articles in Wolof.[50]

Other publications have been directed more specifically towards civic education. The government rural development agency *Société de Développement et de Vulgarisation Agricole*, with financial support from the American Government, distributed in 1991 two informational booklets. One explained various national laws and codes, the other outlined the constitution, organization of the government, and electoral system.[51] The Senegalese government also financed the publication of two instructional pamphlets in Wolof and other national languages designed to instruct citizens on how to vote under the provisions of the new 1992 electoral code.[52]

Yet only an infinitesimal percentage of the population possesses the literacy skills necessary to read these Wolof-language publications. Of the 3.8 million people who are unschooled in French, a paltry 10,300 can read and write any of the six national languages.[53] The literacy rate in Wolof is lower still.

If a knowledge of the French alphabet is rare among non-French speakers, such is not the case with the Arabic alphabet. Since it is common practice for Muslim parents to send their children to Koranic schools (*daara* in Wolof) for religious instruction, many children learn to read and write Arabic characters, and some even learn the Arabic language itself.[54] About a quarter million people who are unschooled in French are today literate in Arabic.[55] The number of people who are able to read Arabic characters is probably much higher.

Two political parties have attempted to capitalize on the relatively high number of people who can read the Arab alphabet by publishing whole or parts of their party organs in *Wolofal* - Wolof written with Arabic characters. This practice originated in the late-nineteenth century when disciples of Amadou Bamba - the founder of the Mouride brotherhood - began writing Wolof poetry using Arabic characters, a tradition that continues to this day.[56] The first party to publish in *Wolofal* was the RND which, under the leadership of the late Cheikh Anta Diop, pushed to make the use of national languages in public life and education a political issue. Several *Wolofal* articles appeared during the late 1970s in the RND party organ *Siggi* (later renamed *Taxaw*). A few years later the PDS prepared to publish a *Wolofal* edition of its party organ which it planned to call *Demokarat*. The new paper, however, never progressed beyond galley proofs. Abdoulaye Wade has since charged that the government interceded with the printers to block the production of

the paper.[57] Be that as it may, the fact remains that political publication in *Wolofal* has been sparse and intermittent.

To sum up, the print media generally reaches only those who are literate in French, who have the money to buy the relatively expensive publications, and who live or work close to where the journals are sold. Those who the lack money or literacy skills, or who live far from distribution centers are shut out. Furthermore, attempts to reach a wider audience through publication in Wolof and Wolofal have been largely unsuccessful. Such publications appear at best infrequently and reach only a small fraction of the uneducated population.

C. The Airwaves

Radio and television have the potential to reach a far wider audience than the print media: The 1988 census-takers found that one of every ten Senegalese households owns a television; and seven of every ten a radio.[58] Furthermore, people seem to attend to these media regularly. In Dakar, the only area in Senegal where audience surveys have been conducted, researchers found that over half the population listened to the radio every day. The figures for television were somewhat lower; with only about 40 percent of the Dakar population watching television daily.[59] The number of television-watchers, though, appears to be growing: A 1992 survey found that only 6.7 percent of the 1000 Dakarois surveyed watched no television at all.[60] Outside Dakar people attend to radio in greater proportions than television. While some resourceful residents of Senegal's many non-electrified villages hook up televisions to car batteries, cheap radios are nonetheless far more ubiquitous in the countryside.

The state-run agency *L'Office de Radiodiffusion et Télévision du Sénégal* (ORTS) maintained until 1991 a near monopoly over domestic AM and FM airwaves. ORTS operates several regional radio stations and two channels at the national level: the

[58] *Recensement general*, table 7.06. This census data finds corroboration in a 1990 study conducted by UNICEF which found that 95 percent of Senegalese households have access to a radio. *Sud Hebdo*, 19 September 1991, p. 7.

[59] These surveys are reported in A.-J. Tudesq, *La Radio en Afrique noire* (Paris: Pedone, 1983) pp. 218-19, 228.

[60] The survey was conducted by the consulting firm BVA Afrique for RTS. The results were reported in *Sud Hebdo*, 24 September 1992, p. 6.

"international" channel which broadcasts exclusively in French, and the "national" channel which broadcasts in local Senegalese languages. The majority of the national channel broadcasts are in Wolof, a conscious choice on the part of ORTS.[61] As the Director of Radio-Sénégal in the mid 1970s explained:

> The only way of building national integration was to concentrate on the Wolof language. While paying lip-service to the diversity of local languages, this single local vehicular language responds to the needs of the people, and therefore it is the role of radio to play its part in supporting it.[62]

ORTS also operated a single, and until recently, unique television channel. Its programming is mostly in French with some Wolof and other national language shows.[63]

Several international radio networks such as Voice of America, *Radio France Internationale*, Radio Syd, and *Africa N°1* transmit to Senegal on shortwave frequencies. Nonetheless, the Senegalese listen in far larger numbers to the ORTS operated AM and FM stations. A 1990 survey of Dakar and Pikine listeners found that 85 percent of those surveyed listened the evening before to ORTS programming, while only a combined 15 percent listened to any of the international shortwave broadcasts.[64]

One reason for the popularity of the domestic stations is that AM/FM radios are cheaper and thus more common than shortwave radios. Another factor is language. Almost half the population of

---

[61] A study conducted in 1979 found that on the national channel 65% of the broadcasts were in Wolof and 30% in Pulaar. Soninké, Diola, and Mandingue together accounted for only 5% of air time. See Jérôme Carlos, "*La Radio et la Télévision en faveur de la participation à la vie culturelle: le cas de Sénégal*" in *La Fonction culturelle de l'information en Afrique* edited by *Institut Culturel Africain*. (Dakar, Abidjan, Lomé: *Nouvelles Éditions Africaines*, 1985) p. 166.

[64] SECODIP survey July 1987/February 1990.

Dakar and Pikine does not understand French.[65] These people may well be attracted to the broadcasts of the ORTS national channel that they can understand. In this regard it is telling that the 1990 survey found that of the 85 percent of the people surveyed in Dakar and Pikine (where concentrations of francophones are high) who listened to ORTS broadcasts, 60 percent tuned into the national channel, while only 40 percent listened to the French-language international channel.[66]

Another important reason for the popularity of the ORTS stations is that shortwave networks broadcast to many African countries simultaneously. Although they carry news reports on Senegal and interviews with national political leaders, the time allotted to Senegalese topics is nonetheless limited. The main carriers of national public debate are the ORTS operated stations, which intend their programming almost exclusively for the domestic audience.

The state-run media have not, however, treated political parties evenhandedly. The ruling *Parti Socialiste* has historically enjoyed a privileged position. Political commentators sympathetic to the government provide insight into and interpret international and domestic political developments. Journalists report on the many international or national conferences on *démocratie* sponsored by the government, international organizers, or local non-governmental organizations, often restricting coverage to a few brief, laudatory remarks made by participants about the Senegalese experience. Each year the television and radio stations both broadcast a half dozen presidential speeches on the occasion of state and religious holidays. Traditional historians and praise-singers, called in French *griots*, put together weekly radio segments in which political endorsements of the PS slip discreetly into the recounting of the exploits of historical heroes.[67] Music variety shows include in their programs songs with political content, usually flattering to the PS and the President. In the months preceding the 1993 elections, for instance, several new

---

[65] According to the 1988 census, 47% of population (aged 6 years or more) of the departments of Dakar and Pikine cannot read or write French. The percentage of people that cannot understand spoken French is probably somewhat lower. See Recensement general, table 4.07.

[66] SECODIP survey July 1987/February 1990.

[67] The most famous of these radio griots is El Hadj Mansour Mbaye, a close confidant of Abdou Diouf who campaigned hard for the President in his 1988 bid for re-election. Although he kept a lower-profile in the 1993 electoral campaign, urban youth frustrated by the victory of Abdou Diouf set his house on fire after the announcement of the election results.

songs praising Abdou Diouf hit the charts: "*Cohabitation*" by Ouza, "*Le N° 10*" by Thione Seck, and two songs entitled "*Démocratie*," one by Khar Mbaye Madiaga, the other by Kiné Lam.

For opposition parties, access to the state media is greatest during the official two or three week period of the electoral campaign that precedes presidential and legislative elections, as mandated by the electoral code. Yet even during this period, access has not always been equal. While the authors of the electoral code allocated equal airtime to presidential candidates, legislative candidates of the ruling party received as much airtime as all the opposition party candidates combined.

The airtime allocated to opposition parties, however limited, has been essential to parties otherwise locked out of the state media. The few weeks of nightly broadcasts that precede every election have provided the best way for small, organizationally weak parties to reach a wide audience.

In 1991 the government instituted a series of reforms aimed at liberalizing the state media, reforms which were themselves part of the ruling party's larger goal of deepening its legitimacy in the wake of its bitterly contested victory in 1988.

First, the President created in May 1991 the *Haut Conseil de la Radio et Télévision* (HCRT), a commission empowered to watch over the electronic state media to safeguard impartiality and pluralism in news reporting, and to ensure equal access of political parties to radio and television.[68] The HCRT has, however, been able to carry out its mandate in only a fragmented, tentative manner. The law governing the HCRT gives the commission little authority to enforce its own decrees and advisos. Furthermore, the government has shown that it will not tolerate criticism by the HCRT that it deems too harsh; in December 1992 it removed two outspoken members after the commission censured the state media for news coverage biased in favor of the PS.[69]

---

[68] More specifically, the HCRT is charged to oversee new laws requiring radio and television to provide balanced reporting of parliamentary debates, broadcast official party communiques and party propaganda, cover public party meetings, provide equal time for each presidential and legislative candidate during the electoral campaign, and invite all political parties to participate in broadcasted debates or round table discussions. *Loi N° 92-57 du 3 septembre 1992 relative au pluralisme à la Radio-Télévision.* Chapters 2 through 4. *Loi N° 92-16 du 7 février portant Code Electoral (partie Législative)* articles LO 96 and 100-102.

[69] Sud Hebdo, 23 December 1992, p. 2. Wal Fadjri, 30 December 1992, p. 4.

The government also transformed the legal status of ORTS, the state-owned radio and television station. Partially to meet the privatization requirements of structural adjustment, and partially as a result of the President's desire to liberalize the state media, the National Assembly in December 1991 voted into law a bill proposed to transform ORTS from a stated-owned public enterprise into a financially autonomous "national company."[70] The newly named *Radio-diffusion Télévision Sénégalaise* (RTS) has, nevertheless, remained politically obligated to the state and the ruling party, since the President retains an important voice in naming senior staff, and the new company has not yet freed itself of all government subsidies.[71]

In addition, the government exposed the newly reorganized RTS to competition. Since the end of 1991, two non-governmental FM broadcasters and two television companies have begun operation.[72]

---

[70] *Le Soleil*, December 17, 1991, pp. 1 & 4.

[71] Consider for example the backstage role of the President and his lieutenants in the replacement of Tidiane Daly Ndiaye by Guila Thiam as Directeur-General of RTS and the consequent restructuring of this national company. See *Wal Fadjri*, 31 January to 6 February 1992, p. 8; and *Le Témoin*, 14 July 1992, p. 4. As for the financial autonomy of RTS, the 1991 law does not make explicit the independent sources of funding for RTS, an omission attributable to sharp disagreement in the government about where such monies should come from. The National Assembly rejected a proposed surcharge on electricity consumption. The final decision was left to Presidential decree. Many observers think a fuel consumption tax to be the most likely future source of income. In any case, RTS will still receive some remuneration directly from the state. See *Sud Hebdo* 19 December 1991, p. 3.

[72] The first non-governmental FM radio broadcaster to enter the scene was *Radio-France internationale* (RFI), a state-financed French public corporation that had long broadcast to Senegal on shortwave frequencies. In September 1991 it began leasing radio time from RTS. Another competitor entered the scene in January 1992 when *Africa N° 1*, a privately-owned Gabonese network, also leased time from RTS. In addition, *Sudcomm*, a Senegalese independent company that publishes *Sud Hebdo* and *Sud au Quoditien*, has filed an application to begin broadcasting. As for television, in December 1991 the French concern *Canal Plus* began service in Senegal, broadcasting French-language entertainment programming direct from Europe. In May 1992, TV5 - a multilateral francophone television network - began experimental broadcasts, with a view towards wider broadcasting sometime in 1993. On RFI see *Le Monde*, 18 July 1991, p. 19. *Sud Hebdo*, 19 September 1991, p. 7. On *Africa N°1* see *Wal Fadjri*, 10 January 1992, p. 7. On the plans of *Sudcomm* see *Sud Hebdo*, 30 April 1992, p. 10. *Sud Hebdo*, 22 December 1992, p. 7. On *Canal Plus* see *Le Témoin*, 24 December 1991, p. 10. On TV5

These new radio and television competitors have targeted the Dakar metropolitan area. It is here that the most affluent, most francophone segment of society lives and works.[73] To non-francophones and those living outside Dakar, the Wolof-language radio broadcasts of the RTS National Channel remain the main source of information.

The combined effect of the three governmental actions - creating the HCRT, transforming the legal status of ORTS, and exposing the state electronic media to competition - has thus been limited. The source and content of political information accessible to the non-Francophone majority remains restricted to the Wolof and other national language programming of the PS dominated National Channel and RTS television. Furthermore, political parties remain shut out of the state media, with the notable exception of airtime received during the duration of official electoral campaign periods.

D. Political rallies and party congresses

Politicians campaign aggressively several weeks preceding presidential, legislative and municipal elections. Campaigning is often done at political rallies - formal public meetings that mix drumming, dancing, praise-singing, and speech making.[74] The speeches are given by candidates, leaders of various party committees, religious dignitaries, and local elected officials. Aware that they are addressing an audience composed of both educated French speakers and non-Francophone Wolof speakers, most orators alternately speak French, Wolof, and a mixture of French and Wolof known as "Dakar Wolof."[75]

---

see *Sud Hebdo*, 27 May 1992, p. 4. *Wal Fadjri*, 29 May 1992, p. 8.

[73] RFI, for instance, in researching the Senegalese market conducted a market survey for the Dakar-Pikine area only; its FM broadcasts do not reach far beyond this zone.

[74] For a more detailed anthropological study of Senegalese political meetings see Deborah Heath, "Spatial Politics and Verbal Performance in Urban Senegal." Ethnology 29,3 (July 1990) pp. 209-223. See also Judith T. Irvine, "Formality and Informality in Communicative Events." American Anthropologist 81,4 (December 1979) pp. 773-790.

[75] For a description of Dakar Wolof see Leigh Swigart, "Practice and Perception - A Look at Code Switching and Mixing in Dakar." *Réalités Africaines et Langue Française* 23 (December 1989 - January 1990) pp. 25-39; and Leigh Swigart, "Women and Language Choice in Dakar: A Case of Unconscious Innovation." Women and Language 15,1 (Spring 1992) pp. 11-20.

These rallies take place in towns and cities that serve as regional centers, and attract anywhere from a few hundred to a few hundred thousand people. The PS, with its stronger party organization and more ample funding, is able to bus supporters from neighboring towns and cities to its meetings and provide incentives (cloth, hats, tee-shirts, sunglasses) to ensure a large turnout. These tactics became an issue during the 1993 presidential campaign. Abdoulaye Wade, the main opponent of the PS candidate Abdou Diouf, pointed out often that he found his crowds "on the spot" whereas Diouf had to bus them in or bribe them. While Wade did indeed attract large crowds of local residents, those who attended his rallies tended to be young adults and adolescents, many of whom were not old enough to vote.

Although representative statistics are unavailable, many voting age town dwellers I interviewed had attended at least a few political rallies, usually of their preferred party, but occasionally of other parties as well. Villagers tend to attend less frequently, but many men do travel to larger towns to attend rallies. To reach a wider audience, political parties often record their rallies, and disseminate cassette copies to party activists and supporters. Some parties even bring duplicating machines to rallies to speed up the distribution. In addition, cassettes of large, important meetings are occasionally sold in the large urban markets.

Political parties also hold regional and national party congresses that reach into local political organizations, and are attended by party notables, cadres, and activists. Most parties conduct these meetings in French, although some parties, such as the *Parti pour la Libération du Peuple* (PLP) - which advocates the use of Wolof as the language of public discourse - conduct many congresses in this native language.

* * *

I have tried to show in this survey of communication channels that the population of Senegal is bifurcated in terms of access to the messages disseminated by the political elite. The Francophone, mostly urban minority has access to rich and varied sources of information on politics and *démocratie*. For those Senegalese who do not understand French, the passage of information follows considerably narrower channels.

Does this bifurcation affect how different segments of the population understand *démocratie* and *demokaraasi*? To get a sense for how members of the Francophone bi- and multilingual fraction of the population use and understand these terms I interviewed about twenty Senegalese who had attained at least a secondary school education. The interviews were open-ended, and conducted in both Wolof and French.

Several people spoke of these terms as the freedom to form political associations and express opinions and grievances - views that echoed arguments advanced by the governing party. A 37 year-old woman who owned and operated a pre-school in Dakar, and had never voted or belonged to a political party, remarked in French that she believed there was *démocratie* in Senegal because "Abdou Diouf has allowed many political parties to be formed - there are now seventeen." She later added in Wolof that to her, *demokaraasi* meant "to be free to say whatever you want, according to your conviction." An unemployed 30 year-old, who professed attachment to the PLP but had never voted, stated in Wolof that "*demokaraasi* is liberty of expression, to say your opinion without denigrating others." A 51 year-old library archivist employed by the PS explained in French that "*démocratie* means letting people express themselves in speech and in writing; letting them say what they want and what is bothering them." Other people spoke of *démocratie* and *demokaraasi* in terms that paralleled the views of the opposition, emphasizing the centrality of *alternance*. Typical was the statement of a 65 year-old retired industrial worker who has supported the PDS for over ten years. He explained in French that:

> *Démocratie* is coming slowly, but it has not yet totally arrived. It doesn't yet work as it should because those who rule today haven't allowed other parties to take their place. If they did, then there would be *démocratie*.

It thus appears that members of this educated segment of the population use both the French and Wolof terms in roughly similar ways. Furthermore, it seems that their views of *démocratie* and *demokaraasi* tend to reflect loosely the ideas and positions generated by the different factions of the political elite that are reported in the French-language media. Newspapers, electronic broadcasts, and conferences appear to influence people's understanding of these concepts broadly, even if these media don't determine rigidly how people use them.

The majority of Senegalese are, however, cut off from the views of *démocratie* presented in the French language. Their understanding of this concept is conditioned by the Wolof-language speeches given at meetings and rallies, heard on cassettes, or broadcast on radio and television. What picture of *demokaraasi* do political leaders paint in these Wolof speeches, and how does it differ from views presented in French?

3. From *démocratie* to *demokaraasi*

The messages that get disseminated most widely and most frequently are the ones propagated by leaders of the PS, who enjoy easy and wide access to the broadcast media. We will examine these messages first.

A. Muezzin and Imam in PS explanations of *demokaraasi*.

In Wolof broadcasts, representatives of the PS usually associate *demokaraasi* with the liberty of political parties to organize freely and to express their grievances openly. As one PS candidate for the National Assembly phrased it during a Wolof speech broadcast on radio and television during the 1988 electoral campaign:

> There is *demokaraasi* here thanks to Abdou Diouf; he is the one who brought us 17 political parties. Thanks to Abdou Diouf *demokaraasi* has flourished to the point that everyone can do what they want or say what they want without fear.[76]

Daouda Sow (member of the PS Bureau Politique in 1988 and Deputy in the National Assembly) made a similar point during a rally also broadcast across the country, and excoriated opposition leaders for failing to understand what *demokaraasi* is all about:

> There are those who say that there is no *demokaraasi* in Senegal. But if there wasn't, we wouldn't have 17 political parties. You know, as Abdou Diouf said, "the mosque is there; whoever chooses to do so may call his faithful to pray." Today there may be many calls, but only one is compelling. If they tell us that *demokaraasi* doesn't exist, I think it's because they don't know what *demokaraasi* is. If there wasn't *demokaraasi* Abdou Diouf wouldn't have agreed to compete against three or four other candidates. I believe that even by European standards, there could not be more *demokaraasi* than we have now. Thus, whoever says that there is no *demokaraasi* in Senegal is just speaking blather. You know there is *demokaraasi* here.[77]

The reference to Diouf's statement is worth examining, for the connection made between *demokaraasi* and mosque is not only evocative, but also a theme to which the President, his lieutenants, and regional PS leaders returned repeatedly during both the 1988 and 1993 electoral campaigns. One local candidate from the city of Kaolack, for instance, told a crowd:

> Abdou Diouf is the one who opened up the mosque. Now, whoever wants to give the call to prayer can do so.

---

[76] Abdoulaye Niane, television and radio broadcast, 1988 legislative elections campaign, 25 February 1988.

[77] Daouda Sow, radio and television broadcast, 1988 legislative elections, 9 February 1988.

> Diouf's the one who gave us *demokaraasi*. Now, take a good look and choose the person who pleases you.[78]

The mosque, according to this metaphor, is the locus of electoral competition. Political leaders are muezzins; their programs are calls to prayer; and voters are the faithful. The competition between muezzins is *demokaraasi*.

The function of the muezzin in Islam is to announce the hour of the five daily prayers, and to call the congregation to the special Friday afternoon prayer. In Senegalese Islam, a muezzin need have no special qualifications beyond his ability to learn the calls, and there are no standard procedures for choosing or appointing him. Rarely is there open competition for the position of muezzin; whoever wishes to call, may do so, as long as he has adequately learned the calls. Any given mosque may have several muezzins who rotate their responsibilities. As it happens, the muezzin often belongs to the mildly disdained caste of praise singers known in Wolof as *géwél*. In the organization of the mosque and religious brotherhood, the muezzin does not enjoy a particularly weighty moral authority. In the mosque it is the imam who leads the prayer, and outside the mosque spiritual leadership is provided by the leaders of Senegal's religious brotherhoods.

Why did Diouf choose this metaphor for explaining *demokaraasi* to the country's Wolof speakers? One reason is that it uses an image rooted in Senegalese culture to render this term meaningful - what linguists call "cross-domain mapping."[79] The religious is mapped onto the political. The metaphor provides a link between a newly rearranged political realm with another realm that has maintained its coherence. By saying that *demokaraasi* is analogous to what goes on in a mosque, Diouf is attempting to ground this Western-import in meanings generated out of everyday life. The metaphor thus inaugurates a fresh way of looking at politics by inviting people to reflect on the familiar.

On another level, Diouf is engaging in the battle to define the concept in a way beneficial to his party by conveying the idea that *demokaraasi* involves the freedom to express oneself and to organize political parties. The muezzin stands atop the minaret to summons the faithful to prayer in the same way that the political leader beckons to potential voters. Both call out their message and wait for those who believe to appear. The equation is simple and powerful.

---

[78] Quoted in Heath, "Spatial Politics," p. 217.

[79] George Lakoff, "The Contemporary Theory of Metaphor." In Metaphor and Thought, 2nd edition, edited by Andrew Ortony (Cambridge: Cambridge University Press, forthcoming).

The image of mosque also grounds *demokaraasi* in the legitimacy of Islam. By appropriating the language of Islam, it wraps the profane realm of politics in the sacred mantle of religion. That political leaders seek to borrow religious symbols to bolster their own claim to legitimacy is hardly new in Senegal. For centuries Wolof kings presented themselves as sacred beings. It should be added, however, that political and religious symbols of authority are rarely isolatable in Senegal since the two have mutually influenced one another. The ways that devout religious disciples today show obedience to religious authority - by kneeling, showering themselves with dust, and remaining stooped over in submission - are borrowed from the manner in which subjects showed deference to Wolof kings in years gone by.[80] Religious leaders also borrowed from French colonial rulers, patterning their own title *Khalifa-Général* after the title of the French *Gouverneur-Général*.[81] The appropriation of the image of mosque might best be seen, then, as a novel attempt to tap old sources of legitimacy.

The mosque metaphor is all the more attractive to Diouf because it pushes the issue of *alternance* to the background. Absent from this metaphor is any reference to the power or authority at play. The job of muezzin is simply to call. It is the imam who leads the prayer, and it is the leaders of the islamic brotherhoods who are the true moral leaders of the religious community. By equating political leaders with muezzins, Diouf (and here Sow) sidesteps the fact that presidential candidates do not merely woo supporters, but aspire to rule the country. The metaphor of the muezzin thus cleverly hides the issue of governance. The mosque has many muezzin. The powerful call of one does not preclude the others from calling. *Demokaraasi*, according to this metaphor, is limited to attracting supporters. The metaphor breaks down when one tries to imagine one of the muezzin as a president who not only calls, but governs.

The issue of *alternance* thus gets obscured by the mosque metaphor. If a mosque can have several muezzins at a time, why can't Senegalese *demokaraasi* accommodate several presidents at a time? Why must voters choose only one? Why can't three or four presidents govern at the same time? The logic may seem stretched to the American mind, but it is not an altogether inconceivable extension of the mosque metaphor. One Senegalese cartoonist, known as an acute social observer, poked fun at people who subscribe to

[81] O'Brien notes that: "The Khalifa Général is the successor Amadou Bamba, and his Franco-Arabic title...is the assertion of his claim to dominate the other (lineage) khalifas as the Governor-General of French West Africa overshadowed the territorial governors in the colonial administrative structure...." Mourides of Senegal, p. 122.

this logic in two successive cartoons that appeared in the satirical newspaper *Le Cafard Libéré* during the 1988 electoral campaign. The cartoon strip follows the travails of a character named Goorgoorlu - Try-to-do-well - a usually unemployed Dakarois who flounders comically and tragically in his day-to-day efforts to provide for his wife and children. After watching the four presidential candidates make their campaign promises on television his friend Tapha asks him if he knows who is going to vote for. Goorgoorlu declares:

> Of course! For Savané who promises me work, Mbaye Niang for education in national languages for my children, for Diouf who guarantees me *demokaraasi*, and Ablaye who promises me rice and fish every day. I'm no longer undecided. I'll vote for all four.[82]

When Tapha tries to explain that he can't vote for all four, Goorgoorlu rebuts with both defiance and earnestness: "Why not? We have a *demokaraasi*, no?"[83] The mosque metaphor, then, by sidestepping the issue of *alternance* may be giving rise to understandings of *demokaraasi* not altogether intended by its propagators.

Perhaps cognizant of these difficulties, Diouf rearranged the metaphor when he returned to it in the 1993 electoral campaign. The new formulation moves the issue of leadership squarely to the center. He explained in Wolof:

> I want the country to have *demokaraasi*.... Here is the mosque; whoever wishes, may call people to prayer. But if there are many muezzins, there can be only one imam.[84]

In this revised version, the muezzins are presidential candidates, and the President is the imam, the member of the religious community who leads the prayer. Both imam and President are classified by Wolof speakers as belonging to a category of leaders known as "*njiit*." A brief examination of this category will illuminate the nuances conveyed to Wolof speakers by equating president and imam.

---

[82] Goorgoorlu is calling the candidates by their familiar names. "Savané" is Landing Savané, Secretary-General of *And-Jef/Mouvement révolutionnaire pour la démocratie nouvelle*. "Mbaye Niang" is Babacar Niang, Secretary-General of the *Parti pour la libération du peuple*. "Diouf" is President Abdou Diouf. "Ablaye" is Abdoulaye Wade of the PDS.

[83] *Le Cafard Libéré*, 13 and 20 February 1988.

[84] Abdou Diouf, radio and television broadcast, 1993 presidential electoral campaign, 6 February, 1993.

The term "*njiit*," shares with the verbs "*jiité*" (to lead or govern) "*jiital*" (to put ahead, to chose a leader) and "*jiitu*" (to go in front) the sense of physically "being in front" or "leading." The prototypical example of *njiit* is the imam who stands in front of those assembled at a mosque to lead them in prayer. The Arabic term "*imam*," not coincidentally, derives from a root which means "in front of."[85] A *njiit* is someone whose duty it is to lead or to guide. Additionally, a *njiit* should be someone who is put in front by the community. *Njiit* refers to a leader who is chosen by those he leads, and claims a moral right to lead because he has been chosen by them. Thus the president - who is chosen by the electorate - is also a *njiit*.

Njiit can be counterposed to another class of leaders known as *kilifa*. "*Kilifa*" derives from the arabic word "*Khalipha*." Coming from a root that signified "to come after" or "instead of," the Arabic term dates to at least the sixth century AD. At that time it combined ideas of succeeding or replacing, and meant something like "deputy" or "viceroy" in pre-Islamic Arabia. Upon the death of Mohammad in 632 AD the prophet's companion Abu Bakr assumed leadership of the community. He became known as *khalifat rasul Allah* (the deputy of the prophet of God) thus beginning a long tradition of bestowing the title *Khalifa* on the leader of the Muslim community, and establishing the institution of the Caliphate. With the decline of the Caliphate in the thirteenth century, various Muslim princes appropriated the title for themselves; and the term came to mean little more than a Muslim king or sovereign.[86]

By this time, Islamic beliefs and practices had begun spreading south of the Sahara desert, carried by Berber merchants plying trans-Saharan trade routes.[87] Islam had already reached the Wolof by the mid-fifteenth century, when the Venetian navigator Alvise de Ca da Mosto, sailing under the Portuguese flag, reported that Wolof kings, and to a lesser extent the common people,

professed attachment to the faith.[88] Despite the long presence of Islam among the Wolof, the term *kilifa* did not appear in any written description of the Wolof language until the early nineteenth century - although it may well have entered the language long before that date.[89]

In Wolof usage, the word "*kilifa*" has come to refer to any hereditary or customary leader who holds his position by dint of ascriptive criteria. Typical examples of *kilifa* are the leaders of the charismatic Islamic brotherhoods (*kilifia diiné yi*); these leaders are direct descendants of the brotherhood founders or their most loyal followers. By extension Wolofones also use *kilifa* as an honorific term for older men, heads of households, husbands, and fathers. A *kilifa* is a male leader who has moral authority by dint of age, heredity, custom, and gender; whereas *njiit* refers to any leader who is chosen or placed in front. Thus *njiitu diiné* refers to those lower-level religious leaders, (such as the imam) who are usually chosen by the community; whereas *kilifa diiné* refers to the highest order of religious leaders who descend from the brotherhood founders. For the Wolof there is no question that *kilifa* enjoy a higher moral authority. As one proverb puts it: running up front does not measure up to being a *kilifa*.[90] Because *kilifa* enjoy a more weighty moral authority, they are able to command (*yilif*) whereas *njiit* can only guide (*jiité*).

In this context, it is worth noting two derivatives of kilifa: *muskallàf mi* refers to serious, responsible person, and *kàllafé*

---

[88] Ca da Mosto wrote that "the faith of these first Blacks [i.e. the Wolof of Cayor] is Muhammadanism: they are not, however, as are the white Moors, very resolute in this faith, especially the common people." Ca da Mosto, Alvise, The Voyages of Ca da Mosto translated and edited by G.R. Crone. (London: Hakluyt Society, 1937) p. 31.

[89] The term had already penetrated the Niger river basin by the mid-thirteenth century. According to the medieval arab historian Ibn Khaldun, Soundiata - the founder of the Mali empire - named his fourth son "Khalifa." Khalifa himself ruled the empire from 1274-5, at which time the Wolof states were tributaries of the Mandika - dominated empire. Trimingham, Islam in West Africa, pp. 235-6.

[90] In Wolof: *Daw jiitu du maté kilifa*. Jean Dard, *Grammaire Wolofe, ou méthode pour étudier la langue des noirs qui habitent les royaumes de Bourba-Yolof, de Walo, de Damel, de Bour-Sine, de Saloume, de Baole, en Sénégambie; suivie d'un appendice où sont établies les particularités les plus éssentielles des principales langues de l'Afrique septentrionale* (Paris: *Imprimerie Royale*, 1826) p. 136. See also Mgr. A. Kobès, *Grammaire de la langue Volofe* (St. Joseph de Ngazobil: Imprimerie de la mission, 1869) p. 276.

means to give the impression of being such a person. Linguists included in a recent Wolof-French dictionary the following phrase to illustrate the meaning of *kàllafé*, an example that highlights the heavier moral weight associated with *kilifa* and its derivatives: "*Seen njiit li kàllafewul dara*" which means "your *njiit* is not at all *kàllafé*" or, in other words, "your guide does not seem at all responsible."[91] It would not, in contrast, make sense to say "your *kilifa* is not at all *kàllafé*." A *kilifa* is, by dint of his ascriptive position, considered a serious personage; a *njiit* must prove it by his actions.

This discussion of *kilifa* and *njiit* is meant to shed light on the implications of Diouf equating president with imam. By making this connection, Diouf is reinforcing the idea that both are *njiit*, a category that is situated between muezzin and *kilifa*. Unlike the muezzin, the *njiit* assumes important leadership responsibilities in the community. Most anyone can become a muezzin; one must meet higher standards to become an imam. While there may be many muezzin for a mosque there is only one imam. By drawing a parallel between iman and president, President Diouf is attempting to put himself in a class above the other presidential candidates qua muezzins. Unlike a *kilifa*, the *njiit* is chosen by the community on the basis of his actions and character. The president qua *njiit* is placed in front of the nation by the electorate, and does not enjoy the automatic allegiance, respect, and affection of the *kilifa*. The introduction of imam into the mosque metaphor, then, injects into *demokaraasi* notions of character, singular leadership, and community choice.

The insertion of imam into the mosque metaphor clears up some of the complexities that would lead a voter (like Goorgoorlu) to expect to be able to vote for three or four candidates. In the mosque there can be only one imam; in *demokaraasi* there can be only one president. The introduction of imam into the metaphor, however, cloaks the idea of *alternance* in another way. Simply stated, muezzins - who are often casted - do not in practice become imams. Their powerful voices may bring them new adherents, but their caste status generally precludes them from becoming *njiit*. Thus, electoral competition may pit candidate against candidate; but the position of the President remains unaffected. *Demokaraasi*, in this formulation, licenses Diouf to remain President for an indeterminate period of time.

The overlapping of religious and political themes takes on an added significance in this context. Already within Islamic Wolof culture there is a widespread belief that it is God who ultimately chooses the world's mortal leaders. This idea is expressed in an

---

[91] Arame Fal, Rosine Santos, and Jean Léonce Doneux, *Dictionnaire wolof-français suivi d'un index français-wolof* (Paris: Karthala, 1990) p. 106.

oft cited Wolof proverb: "It is better to throw more wood on a fire lit by God than to put it out."[92] The implied message is that since it is God who put the leader in power (lit the fire), humans should not attempt to remove him (put out the fire).

The PS has attempted to tailor this notion to its own uses. During the 1988 electoral campaign, calendars appeared with a picture of Abdou Diouf and a Wolof caption reading: "President Abdou Diouf: The President that God Gave Us." The tactic appears to have worked on at least some voters. One old woman, for instance, explained to me that "I had to vote for Abdou Diouf because God placed him here."

The idea that the Presidency of Diouf is sanctioned by God was linked directly to *demokaraasi* via the mosque metaphor by Bassirou Diagne, the *Grand Serigne* of Dakar,[93] in a Wolof speech he made during the 1988 electoral campaign:

> *Demokaraasi* like we have here does not exist in many other countries; everywhere people are grasping for it. Yet in our own country there are those in the opposition who do not want it because they did not help build it. If *demokaraasi* could break out of its shackles it would save Africa because in many African countries they do not accept multipartyism; they have a single, unique party. Thus if Abdou Diouf accepts other parties you should help him by acting with respect and restraint so that *demokaraasi* can bring peace here. Even in France, to be a candidate for the Presidency you need 500 signatures, and the people who sign the petition must be notables in their communities. There, you must have credibility to become a candidate. But here in Senegal Abdou Diouf said: "Here is the mosque. Whoever can call the faithful to prayer - let him call." Thus we all need to play the game

---

[92] In Wolof: *Taal bu yalla taal, sanni ci matt moo gënn fey ko.*

[93] The Grand Serigne of Dakar is the leader of the Lebou community. The Lebou are a Wolof-speaking ethnic group that migrated to the *Cap Vert* peninsula in the 18th century. Abdou Diouf played an important role in having Bassirou Diagne named to the position in 1986; Diagne, in return, has been a staunch supporter of the President. In recent years, many in the Lebou community have demanded the ouster of Diagne. Resentment over the Diagne-Diouf connection may have cost the President much support during the 1993 presidential elections in the heavily Lebou populated towns of Yoff, Camberène, and the city of Rufisque. See *Le Devoir*, November 1986, p. 6 on selection of Bassirou Diagne. On the recent flap within the Lebou community see *Le Témoin*, 11 August 1992. *Sud Hebdo*, 2, 12, and 19 November 1992. *Wal Fadjri*, 13 November 1992. *Le Cafard Libéré*, 18 November and 16 December 1992.

> democratically. Every person has the right to vote for the candidate he pleases. On election day, we will support Abdou Diouf. I ask that you all vote for him. If it was in our hands to elect (*fal*) Abdou Diouf we would do it without even voting. But since it is God who chooses our leaders, all we can do is to cast our ballots for Abdou Diouf.... Let's be fair and realize that the seat of the presidency is made for only one person. And the person who should sit there will be chosen by God; let's help him.[94]

It is God's choice that Diouf is president. To vote for him is to act out God's will. *Demokaraasi* may entail the acceptance of opposition parties, but it also appears to involve doing God's bidding. Diagne's rendition of the mosque metaphor thus implicitly reinforces the idea that God has sanctioned Diouf to lead and rule, and that this is an integral part of *demokaraasi*.

One final motif embedded within the mosque metaphor needs to be discussed: the image of political society as a religious community. The tangle of competing and contradictory interests that mark political society gets transformed in this metaphor into a community of believers joined together by prayer and the adoration of a single and unique God. Unlike politicians (and their supporters) who believe in differing programs and visions of how society should be organized, imam, muezzins, and the faithful are engaged in a communal experience of worship. Conflict recedes into the background. *Demokaraasi*, viewed in this light, involves communality, harmony, and reconciliation.

The mosque metaphor, then, grafts onto *demokaraasi* connotations not stressed in the view of *démocratie* presented by the PS in its French-language discourse. Onto the idea of multipartyism and freedom of expression and association get added layers of meaning: undertones of communality and harmony, a pastiche of religious motifs, and the diffusion of *alternance* as an issue through the promotion of an image of president as *njiit*.

B. Images from the Opposition: Buur and Nguur

The image of mosque is not the only picture of *demokaraasi* that gets disseminated to Wolof speakers. Opposition parties try to convey a different message, one that emphasizes the centrality of rules for fair electoral competition and *alternance*. Abdoulaye Wade, for instance, emphasized the need for a strong legal framework to make *demokaraasi* work in this 1988 speech at a PDS convention:

---

[94] Bassirou Diagne, radio and television broadcast, 1988 electoral campaign, 25 February 1988.

> *Demokaraasi* requires that people who live together in a country or the same household; or work together in the same office or company have laws that each individual must respect. If each person did whatever he pleases, nobody would have his own space and nobody would stay. What we want for Senegal is this: a constitution that will be respected by whoever comes to power. We can have peace in this country. We say that the President, Deputies to the National Assembly, and the Prime Minister should be chosen according to the laws of the country....
>
> Not all laws are just laws. Which is just? - The constitution of Senegal is just. It says that whoever wins a majority becomes president. Simply because Abdou Diouf writes a law doesn't mean it's just. You made me secretary-general of the PDS, right? You know that I can do a lot of things, but you also know that there are things I do not have the right to do. Can I, right here, jump on someone and hit him, do to him what I please? If I did that you would resist me. Thus if you elect me, there is a point at which I must stop. I cannot go beyond that point. The same holds true for Abdou Diouf. He has limits beyond which he should not go. He has, however, already gone beyond those limits. That is why I invoke the constitution: "he who has the majority, wins." Abdou Diouf wants to bring in some of his people - his brothers - to count the ballots.[95] It would be like me taking my brother Moustapha Wade to count the ballots. Is that *demokaraasi*? He said his brother would be in charge of counting the ballots. That will not happen here in Senegal![96]

Demokaraasi entails a respect for laws, especially those concerning the transfer of power.

The message of the opposition is, nonetheless, prone to mutation as it moves from French to Wolof. One fascinating glimpse at how meanings can be transformed once conveyed in Wolof is provided by a speech delivered by Landing Savané, the Secretary-General of *And-Jëf*/MDRN. This speech was broadcast on radio and television during the 1988 electoral campaign, three days before election day. Savané delivered the first part of the speech in

---

[95] Several cabinet ministers at the time - including the Minister of Interior charged with overseeing the elections were indeed relatives or close personal friends of the President, a situation which continues to this day. See *Wal Fadjri*, 12-18 April 1991, p. 2.

[96] Abdoulaye Wade, 3rd ordinary Congress of the PDS, Dakar, 2-3 January 1988.

French after which he provided a Wolof summary. Both parts are reproduced here in full:

French

Dear fellow countrymen, the struggle for *démocratie* is a permanent requirement of political combat. In our country it is a vital necessity. *Démocratie* is not measured simply in how many political parties exist - the fascist Chile of Pinochet has many. It is not measured simply by the presence of opposition journals - Haiti and the Philippines have many; they even have independent radio stations. *Démocratie* is most importantly the existence of state institutions above the grasp of any party. It is the acceptance of the principle of *alternance* as the manifestation of the natural evolution of societies. It is also the free expression of all the organized interests of society via the state-run media, which should no longer have the monopoly on communications. It is above all the existence of a dynamic counter-power. It is also the respect for the right to hold different opinions regarding ideology and policy. It is the acceptance of a critical, even radical opposition. It is tolerance. It is the respect for the right of citizens to have access to all information relative to the normal functioning of state institutions. It is also the possibility for every citizen to elect freely his representative and to demand from him accountability. It is naturally the strict separation of temporal and religious power, and an education that helps citizens to better understand the problems of the nation.

The present electoral campaign proves that the budding fascists of the PS are far from understanding and even farther still from accepting these elementary principles since certain among them dare to declare that even the decrepid [croupillon] *démocratie* in place today is too much for our people to handle. Mr. Diouf himself made thinly veiled threats against the opposition and *démocratie* itself. Confronted with the totalitarian impulses of Diouf and his partisans, *And-Jëf* is ready to assume its responsibilities. I call on all the opposition parties, all the democrats of this country - organized or not - to rise up and block the way of this advancing fascism. If Diouf and his partisans attempt on election day to follow through with their electoral coup d'etat, then the people will have to strengthen its resistance by engaging in a massive civil disobedience campaign. The young people, the women, the men of this country can block the path of these apprentice fascists, and impose the will of the people against massive fraud, rising prices, huge cut-backs, and against the unauthorized disengagement of the state.

Thousands and thousands of people have come out during the electoral campaign to voice their rejection of Diouf's regime; a regime of lies, embezzlement, mediocrity, and misery. We have to organize this general discontent. We have to organize a vast political, economic, social, and cultural resistance movement to open the way for an alternative. In the final analysis the future of our country in these critical days is in the hands of the people. Thank you.

Wolof

Fellow Senegalese, I just spoke about *demokaraasi* in Senegal. I explained how the *demokaraasi* that is in place toady is an emptied *demokaraasi* because it does not give the people of Senegal any authority - something that the people in the government (*waa nguur gi*) reserve for themselves. Anything that the people needs or wants to do, the government (*nguur gi*) prohibits if it is not in its own interest. That is why we say that this *demokaraasi* is not enough for us, and we will fight it. Those who argue that this *demokaraasi* is excessive are partisans of the PS. Their declarations show the true mentality of the party: they think that they don't need to take into account any opinions other than their own. They want others to do what they say - something we can never accept. We are here to strengthen the authority of the people. We want to consolidate *demokaraasi*. The elections will soon be here. Abdou Diouf and his supporters are planning to fix the elections so that he can falsely declare himself the winner. We should not have to see that kind of thing. They want the farmer to pay his taxes, but they haven't done anything for him. The farmer should refuse to pay, along with everyone else, to weaken the government (*nguur*) or to make it fall.[97]

The Wolof portion is in some ways a stripped down version of the French speech. The central idea that the *demokaraasi* practiced by Diouf and his partisans is inadequate because it denies people a real say in how government affairs are handled remains, as does his attack on those who claim that there is too much *demokaraasi*, and his closing call for resistance. Shed from the French speech are the references to Chile, Haiti, and the Philippines; totalitarianism and fascism; and any of the specific aspects of *démocratie* he mentioned in French: media, education, or opposition parties.

---

[97] Landing Savané, radio and television broadcast, 1988 electoral campaign, 25 February 1988.

Without these references, the discussion of *demokaraasi* in Wolof is in one respect uprooted from its original context. Gone are the ready-made bench marks provided by the experience of countries and movements around the world against which the performance of Senegal's *demokaraasi* can be measured. Also gone are references to the specific institutional arrangements which make a call for *demokaraasi* concrete and imaginable. Savané calls vaguely in Wolof for increasing the authority of the people, but does not explain what such an arrangement would require, or how it would operate. Perhaps he omitted these allusions to fascism or Haiti because he reasoned they would hold little meaning to the non-Francophone majority of the population. (Indeed in interviews I conducted during the weeks following the precedent-setting elections in the West African country of Cap Verde, few non-French speaking Senegalese could tell me what took place there, despite wide coverage in the French-language media, and moderate coverage in Wolof-language broadcasts).

Yet in another respect, the Wolof portion gets regrounded in Senegalese culture via connotations not present in the French. Savané's choice of words here is revealing. When making reference to the government he consistently used the Wolof word *nguur* as opposed to the universally understood French loan word *góornëmaa* (from *gouvernement*). It could be that he made a deliberate attempt to speak a Wolof unadulterated with French loan words, an explanation that finds support in the fact that Savané is not a native Wolof speaker. Having publicly acknowledged this fact on radio and television several days earlier in the electoral campaign, he may have felt compelled to express himself in relatively "pure" Wolof. The particular word choice, though, may have served other purposes. *Nguur*, unlike *góornëmaa*, carries a web of connotations that implicitly reinforce the image of a Senegalese government inimical to *demokaraasi*.

Nguur is a complex term that covers a semantic field significantly wider than *góornëmaa*, a term first introduced into Wolof during the era of colonial rule to describe the machinery of modern bureaucratic government introduced by the French. Today the term refers rather narrowly to the institutions of government, the body of persons who occupy offices of government, or the President's cabinet.

The word *Nguur* finds its origins in pre-colonial political institutions. It appears to derive from, and remains closely associated with, the term *buur*. European travelers, traders, and missionaries have translated *buur* since the French revolution to mean roughly "king" or "sovereign."[98] In Wolof society, the *buur*

---

[98] *Buur* is translated by the French term "*roi*," for example, in an anonymous lexicon seized during the French revolution from a convent. See "*Vocabulaires Guilof, Mandingue, Foule, Saracole,*

were members of royal lineages who, once ascended to power, had the right to collect tribute from land owners in a given territorial unit.[99]

The term *buur* has taken on strong valuative connotations. Many proverbs paint a picture of the *buur* as arbitrary, cruel, and egotistic. One proverb, for instance, cautions that "the king is not a relative."[100] That is, the egoism of the *buur* can push him to sacrifice his closest relatives to further his self-interest.[101] Another proverb states that "it is not bad to love a *buur*, but a *buur* that loves you is better."[102] Wolof folktales also reflect popular perceptions of the *buur*. One recounts the deeds of two brothers: Samba Satan and Amary Muslim. The pious Amary Muslim treats all he encounters with respect and courtesy, and ends up a blind beggar. Samba Devil violates every interdiction - killing his fathers' horse, his mother, his newborn brother, and an old man, whom he then eats - and becomes a *buur* who rules over many subjects.[103] To be a *buur* requires not godliness and civility but impudence and brutality.

The egoism of the *buur* pushes him to lead a life of indulgence. In popular culture, the *buur* is someone whose desires are satisfied, whose wants are fulfilled. It is perhaps for this reason that *buur* has also come to mean "to be complete or full." The phrase "*gémmiñam buur na*," for example, can be translated to

[102] In Wolof: *Sopp buur aayul, wanté buur bu la sopp a ko gënn.* Cited in Dard, Grammaire Wolofe, p. 135.

[103] Lilyan Kesteloot and Cherif Mbodj, Contes et Mythes Wolof (Dakar: *Nouvelles Éditions Africaines*, 1983) pp. 88-101.

mean "he has a full set of teeth." Literally, his mouth is complete.[104]

Nguur appears to derive from *buur* because in Wolof an initial consonant "b" may mark singularity while an initial consonant "g" or "ng" marks plurality, as in the terms *bët* (eye) and *gët* (eyes). An original meaning of *nguur* may thus have been royalty. These consonants may, however, also mark a relation of product to producer as in the terms *buy* (fruit of baobab tree) and *guy* (baobab tree). In this case, nguur may have originally meant something like the "reign" established by the *buur*. Whatever the original sense or senses may have been, today *nguur* has assumed several meanings. It can mean "reign" as in the phrase *nguurug Yalla* (the reign of God). It can also be used to mean "power" - something that can be assumed (*yor nguur*), renounced (*gedd nguur*), competed for (*xëcco nguur*), or taken by force (*foqati nguur*). And like *góornëmaa* it can refer to the administrative machinery of government or the people who run it.

The connotations of egoism and fulfillment contained in *buur* have also colored the term *nguur*. In Wolof, someone who enjoys leading a comfortable lifestyle is said to "like *nguur*" (*bëgg nguur*). If someone is said to "like *nguur* too much," it is implied that the person is greedy.

An important cognate of *nguur* is the verb *nguuru* which is formed by the root *nguur* and the reflexive suffix *-u*. Translators sometimes render *nguuru* with the English "to govern" or "to rule" - a translation that is not wholly adequate. The reflexive suffix turns the governing inward; it connotes holding power for oneself or in one's own interest. It involves not only the exercise of power, but the gaining of pleasure or enjoyment from it.[105] The meaning of *nguuru* has evolved to the point where indulgence and satisfaction have come to be more central to its meaning than ruling. To many Wolofones, *nguuru* means simply to be comfortable, to enjoy something, to have things feel good. To sit in a nice cushy chair is to be *nguuru*. The sense of governing has been diluted.

Given these connections between *nguur* and pleasure or satisfaction, to say that *nguur* simply means power, government, or reign is not quite right. *Nguur* in its different uses is closely

---

[104] Fal et al, *Dictionnaire wolof-français*, p. 49. Note that in this respect, *buur* is similar to the English term "king," which has been extended to imply wealth (a king's ransom), luxuriousness (king-sized bed), a lavish-lifestyle (to live like a king), or pampering (to treat like a king).

[105] Pathé Diagne, "*Le Pouvoir en Afrique*." In *Le Concept de Pouvoir en Afrique* edited by UNESCO (UNESCO: Paris, 1981) p. 42.

associated with egoism, contentment, and completeness. This term implies that the one who holds power benefits materially from his position. Ideas of governance flow into connotations of enjoyment and gratification. It is said that when Abdou Diouf came to power, he avoided using the term *nguur* precisely because it conjured images of contented, privileged government officials - images at odds with his public insistence that the state should be an instrument of development. It was perhaps for this reason that he told the nation repeatedly during the 1983 campaign that he was *jammu seeni soxla*; literally the "slave of their needs," or in other words their servant.[106]

Savané, by repeatedly referring to the Senegalese government as *nguur* in his Wolof explanation of *demokaraasi*, played on these blended notions of governance, egoism, and self-gratification. The officials of the *nguur* are portrayed as people who exercise power for their own benefit. In the words of Savané, they "reserve" power for themselves; they do not "take into account any opinions other than their own," and they "prohibit" what is not in their "own interest." Real, consolidated *demokaraasi*, according to Savané, implies giving people a voice in how they are ruled to force the *nguur* to govern in the general interest.

Yet the webs of meaning surrounding the term *nguur* make a different interpretation of *demokaraasi* possible - one not intended by Savané. It is possible to understand calls for *demokaraasi* in this context to mean that those in power should share the privileges they enjoy. *Demokaraasi* gets transformed from a redistribution of power to a redistribution of pleasure and benefit. That is, *demokaraasi* shifts from meaning that everyone should *nguuru* (rule) to mean that everyone should <u>experience</u> *nguuru* (gratification). This interpretive shift is not farfetched. Consider this statement by an elderly woman living in the poor Medina neighborhood of the capital city, Dakar. I asked her whether there was *demokaraasi* in Senegal. Her answer:

> "Yes, there is *demokaraasi* here. The Socialist Party chose a local elder to be the delegate for this neighborhood. Everything that he gets from the party, be it rice or sugar, he shares with us. Whenever I have a family occasion he gives me money."

The essence of *demokaraasi* for this woman appears to lie not in choosing her representative to the government or having a say in who rules the country - but in the benefits this delegate brings home. *Demokaraasi* for this woman means distributing material goods.

---

[106] For an account of a similar dynamic in Indonesia see Clifford Geertz, <u>The Interpretation of Cultures</u> (New York: Basic, 1973) p. 318.

Now consider a few lines from the 1991 hit song by Khar Mbaye Madiaga named "*Démocratie*." She sings in Wolof:

> Senegal is the place to imitate when it comes to *demokaraasi*.... Hey my friend Abdou, what you swore to do not so long ago at the Palace of Justice, you haven't gone back on your word. You said "whatever benefits come my way from this office that I don't share with Senegal - those are benefits I prefer not to have."

Senegal is an exemplary *demokaraasi* because the President vowed to share the advantages of his office. *Demokaraasi* as used in this song implies that those who *nguuru* (rule) should make an effort for all to be *nguuru* (comfortable).

In the Wolof portion of his speech, then, Savané left out references to other countries and to specific institutional arrangements that would not resonate with the bulk of his audience; opting instead to put the discussion of *demokaraasi* into a context that people would understand. This context was provided by *nguur*, a term grounded in Wolof history and culture. The problem inherent in this shift is that these meanings drag *démocratie* from its away from its originally intended meaning. That is, the attempt to link the wolof concept *nguur* with the French concept of *démocratie* seems to have contributed unintentionally to the creation of a Wolof hybrid - *demokaraasi*.

C. Images from the Opposition: *Fal* and *Folli*

Two additional terms are of particular importance to the opposition in its attempts to associate *demokaraasi* with *alternance*. These terms - *fal* and *folli* - mean roughly "to elect" and "to vote out of office" respectively.[107] For instance, Abdoulaye Bathily, the Secretary-General of the LD/MPT, explained in a radio broadcast during the 1988 electoral campaign that *demokaraasi* means the following:

> *Fal naa la; defuloo lu baax, folli naa la. Loolu mooy demokaraasi.*[108]

One way to translate this statement would be thus: "I elected you; you didn't do anything good so I voted you out of office. That is *demokaraasi*." At least this is the message that Bathily intended

---

[107] *Folli* derives from the root *fal* plus the inversive suffix - i. Other examples include *ub/ubbi* (to close/open); *takk/tekki* (to attach/detach); and *boot*/botti (to carry on one's back/remove from one's back). See Omar Ka, *La Derivation et la Composition en Wolof* (Dakar: CLAD, 1981) pp. 16-17.

[108] Abdoulaye Bathily, radio and television broadcast, 1988 electoral campaign, ? February 1988.

to get across, a meaning that conveys the centrality of *alternance* to *demokaraasi*. The words *fal* and *folli*, however, carry connotations that make such a translation problematic, and make it unlikely that many Wolofone speakers comprehend his words in this way.

To understand why this is so requires a brief overview of the traditional practices with which *fal* and *folli* have long been associated - practices of choosing rulers from among several pretenders common in the pre-colonial Wolof states of Bawol, Jolof, Kajoor, and Waalo over long periods of their history.

In each state eligibility for rulership was restricted by birth. Pretenders to the throne - called *lawax* in Wolof - had to descend on the patrilineal side from the original founder of the state, and at the same time belong to particular noble lines on the matrilineal side.[109] The power to select (*fal*) or depose (*folli*) rulers, within the confines of restrictions stated above, resided primarily in a council of men issuing from the most important lineages. The councils - known as *waa reew mi* in Kajoor, *seb ak baawor* in Waalo, and *njenki* in Jolof - sometimes included leading members of the freeman and slave orders, although their influence does not appear to have been great.[110] Later, as the influence of Islam grew, leaders of the Muslim community were sporadically included.[111] There is some ambiguity in the historical record over the size of these councils. Several European and Wolof sources suggest that the councils included less than ten men each, while

---

[109] In the states of Kajoor, Jolof, and Bawol the rulers were always men. The exception was Waalo where, as Boilat noted, women sometimes ruled. Abbé David Boilat, *Esquisses Sénégalaises* (Paris: Bertrand, 1853) p. 284. Another exception: In Jolof there were no matrilineal requirements; it sufficed to descend from the founder of the state on the paternal side. Henri Gaden, *Légends et coutumes sénégalaises. Cahiers de Yoro Dyao* (Paris: Leroux, 1912) p. 27.

[110] *Waa reew mi* means "the people of the country." The meaning of *njenki* is unknown. According to legend the name *seb ak baawar* recalls the rivalrous relationship of the two sisters who founded the two principle noble families in Waalo. The first sister - named Waalil - had only one daughter. Jealous of her sister Fajeng, who had many children, she called them *baawal* - "to spread all over." Believing that saying such things would bring misfortune on Fajeng, their mother called Waalil *sib* - "to scorn." *Seb ak baawar*, then, may be a deformation of *sib ak baawal* - "to spread all over and to scorn." Gaden, pp. 20 and 27. Mamadou Diouf, *Le Kajoor au XIXe siècle* (Paris: Karthala, 1990) p. 61.

[111] Ibid., p. 61.

others imply that they were larger bodies of nobles and freemen, of which these named dignitaries were simply the leading members.[112]

Deliberation by each council usually required a series of meetings. In Waalo, for instance, the selection of a ruler normally necessitated three gatherings of the *seb ak baawor*. The first meeting was a conference of the dignitaries of the three leading noble families. A second meeting included the leading members of two other noble families. At the third and last meeting, during which the *seb ak baawor* announced its selection, the participants of the first two meetings were joined by notables from the order of royal slaves (*jaami buur*) and two tributary territories, who assumed a consultative role.[113]

The historical record suggests that these councils placed little emphasis on the formal procedures of choosing. What was important was achieving a consensus; not the protocols (raising hands, counting voices, casting ballots) that are central to Western notions of voting and electing. Joseph Ki-Zerbo had this difference in mind when he remarked that in many traditional African states, including those of the Wolof:

> There was not an arithmetic, formalist *démocratie* that posted the yes's and the no's in a numeric balance sheet; but a *démocratie* that lived by unending dialogue that lasted until exhaustion.[114]

Whether the deliberation of the councils counts as "*démocratie*" is questionable; Ki-Zerbo is, nonetheless correct to emphasize the consultative as opposed to computative nature of the process.

---

[112] Compare the descriptions of Bawol by K. Samb in Victor Martin and Charles Becker, "*Les Teeñ du Baol: Essai de chronologie.*" *Bulletin de l'IFAN* Series B, 38,3 (1976) p. 499; and Kajoor by L.J.B. Bérenger-Féraud, *Les peuplades de la Senegambie* (Paris: Leroux, 1879) p. 45 with the descriptions of Kajoor by Assane Sylla, *Philosophie morale des Wolof* (Dakar: Sankoré, 1978) pp. 130-31; and Waalo by H. Azan, "*Notice sur le Oualo.*" *Revue maritime et coloniale* 10 (January-April 1864) p. 335; and Gaden, *Légends et coutumes sénégalaises. Cahiers de Yoro Dyao*, p. 20.

[113] Gaden, *Légends et coutumes sénégalaises. Cahiers de Yoro Dyao*, p. 21.

[114] Joseph Ki-Zerbo *Histoire de L'Afrique noire (d'hier à demain)* (Paris: Hattler, 1972) p. 615? See also Pathé Diagne, "*De la démocratie traditionelle*" *Présence Africaine* 97 (1st quarter, 1976) pp. 18-42. George B.N. Ayittey, "*La démocratie en Afrique précoloniale*" *Afrique 2000* 2 (July-September 1990) pp. 39-75.

We must be careful, however, not to romanticize these traditional practices.[115] Conflict in the councils was often sharp, as one chronicler noted of the *seb ak baawor* in Waalo:

> Circumstances often rendered discussion very stormy, because the council could not always find an heir who met the desired conditions; or it could be presented with several candidates that filled the requirements equally.[116]

Moreover, when the councils failed to reach a consensus the ultimate arbiter was force. Another observer made these remarks about the selection of rulers in Kajoor and Waalo:

> It is not rare that various competitors employ violent or occult means to conquer the coveted position. And among the Wolof, as among all others, blood is often spilled in the name of this or that ambition.[117]

The existence of deliberative processes, then, did not always assure the cheerful achievement of consensus.

The practical limitations of *fal* and *folli* in the councils notwithstanding, Wolof speakers to this day closely identify the meaning of these concepts with consultation and agreement. One woman, for example, told me that *fal* meant "people joining together to agree on someone they all trust."

Because *fal* and *folli* were linked to the selection and deposition of rulers, these terms have become common currency in talking about the modern electoral process in Senegal. These terms do not, however, correspond neatly to Western democratic concepts of "electing" and "voting out of office," since the concepts *fal* and *folli* carry different connotations, most importantly, the connotations of deliberation and consensus. *Fal* and *folli*, in short, require the airing and harmonization of opinions, not the counting of votes. As the Governor of the region of Cap Vert of Senegal observed, "our system of values has not, up to this point, integrated the vote. In traditional Africa it was consensus that prevailed."[118]

---

[115] For a more general discussion of this tendency see V.G. Simuyu, "The Democratic Myth in the African Traditional Societies." In Democratic Theory and Practice in Africa edited by Oyugi et al. (Portsmouth, New Hampshire: Heinemann, 1988) pp. 49-70.

[116] Azan, "*Notice sur le Oualo*," p. 335.

[117] Bérenger-Féraud, *Les peuplades de la Senegambie*, p. 44.

[118] *Le Soleil*, 13 August 1982, p. 7.

The point is that this connotation of consensus undermines the very notion of *alternance* that is central to Bathily's intended meaning. Undertones of harmony have leeched from the concepts *fal* and *folli* to color the concept of *demokaraasi*, reinforcing images of consensus that are already present in the mosque metaphor.

5. Conclusion

Fractions of the Francophone political elite are today vying to define and appropriate *démocratie* to advance their own political interests. While the opposition insists that the term entails fair rules of electoral competition and *alternance*, the ruling party argues that it is essentially the right to organize political parties and to express grievances. In their competition to lend exclusive legitimacy to their positions, each faction uses a variety of channels to disseminate their opposing views to the wider population, trying to win new adherents and supporters.

Yet the population of Senegal is segregated in terms of access to political knowledge. The literate, urban minority that attends French-language schools, reads French-language books and journals, and understands French-language radio and television broadcasts have access to diverse sources of information on politics and *démocratie*. Views of *démocratie* held by this educated segment of society tend to reflect broadly the ideas and positions held by the different factions of the political elite. For non-Francophones, in contrast, the key channels are political rallies, cassette recordings, and Wolof-language electronic media programming - especially electoral campaign broadcasts.

Because concepts like "*démocratie*" have no direct equivalents in Wolof, members of the political elite have attempted to convey their views of *démocratie* by projecting traditional Wolof words into new political contexts or by using metaphors to bridge the gap between the familiar and unfamiliar. These projections and metaphors, however, carry with them meanings embedded in Wolof history and culture that tend to pull *démocratie* from its semantic foundations. The mosque metaphor and the use of the words *fal* and *folli* stretch *demokaraasi* with connotations of communality and harmony, while the use of *nguur* extends *demokaraasi* to signify a wide distribution of material benefits.

To what extent are such shifts in meaning intentional? Certainly the choice of mosque metaphor on Diouf's part was carefully considered, as may have been Savané's repetition of *nguur*. Nonetheless, political leaders are not always adept speakers of Wolof, as their frequent blunders suggest. Abdou Diouf has referred to himself as *càmmiñ* - a term that means brother, but the use of which is restricted to women. In the most recent presidential campaign, the twisted and sometimes incomprehensible Wolof of Madior Diouf was the most visible target of drubbing. In

the harsh appreciation of one taxi driver, "he doesn't have anything going for him; he doesn't even understand Wolof."[119] Even former President Léopold Senghor - a renowned Wolof linguist - made occasional slips. A widely recounted anecdote has it that once during a radio speech on agricultural policy he meant to address the problem of brush fires (*daay*), but unknowingly raised the issue of bowel movements (*day*). These gaffes suggest that, at a minimum, not all bent meanings are the result of deliberate calculation.

Be that as it may, the shifts in meaning from *démocratie* to *demokaraasi* should not be seen solely as the consequence of specific word choices; these shifts emanate from the general nature of translation - a process that inevitably involves some loss, addition, or skewing of meaning.[120] Diouf, Savané, and Bathily relied on a set of cultural premises grounded in the everyday life of the unschooled populace because the presuppositions that provide meaning to the French term *démocratie* are missing in Wolof. The transfer of meaning from French to Wolof involves a shift of reference points and corresponding metaphors. The absence of equivalent cultural frames in Wolof has, in short, required the different factions of the Senegalese political elite to generate new frames of interpretation that fit the cultural frameworks of non-French speaking Wolofones.[121] The evidence presented in this paper thus suggests that the Wolof concept *demokaraasi* as used by the political elite is something other than the French term *démocratie* pronounced in accordance with the phonetic rules of Wolof. The transfer of meaning from French to Wolof entails a shift of cultural reference points, a shift that bends the original meaning of the concept.[122] The lesson is that in studying the diffusion of political ideas in multi-lingual countries, we need to take seriously the issue of translation.

ORDINARY POLITICS: IMMIGRANTS, DIRECT ACTION AND THE POLITICAL PROCESS IN FRANCE

Martin A. Schain

Center for European Studies

New York University

Prepared for delivery at the Annual Meeting of the American Political Science Association, The Washington Hilton, September 1-5, 1993

Schain

A great deal has been written during the past few years about the normalization of French politics. The one political pattern that has not been normalized, at least in the conventional sense of the word, is the relationship between protest and ordinary politics. At the same time that the Fifth Republic has produced a series of powerful governments capable of bringing about policy reform with astonishing rapidity (compare this with the recent US experience), these same governments have proven to be surprisingly vulnerable to veto by protest. Indeed, every government in the past 12 years (the years of "normalization") has seen at least one of its key projects rejected, not by ordinary parliamentary processes, but by protest in the streets.

It is hardly novel to note that there appears to be a high level of protest behavior in France. Russell Dalton's comments are typical:

> A call to the barricades stirs the hearts of many Frenchmen, contributing to historically high levels of unconventional political activity. In the words of one expert, protest in France is a national way of life.[1]

Nevertheless, although Dalton does show high levels of "unconventional political participation" in France, these levels are only slightly higher than those of the United States, Britain and Germany for the same year. The marginally higher French percentage is due mostly to higher participation in lawful demonstrations, and participation in unofficial strikes. In fact, what

Dalton demonstrates most convincingly is that, cross-nationally, participation levels in moderate forms of unconventional politics rival those of more conventional modes.[2]

What appears to differentiate the French pattern from that of other industrial democracies, is the *impact* of protest movements. The efficacy of protest--its impact on the policy-making process-- seems puzzling in light of two developments during the period of the Fifth Republic. The first is the general ability of governments to dominate the legislative process; and the second is the high level of legitimate support accorded the institutions of the Fifth Republic.

A combination of constitutional tools and working majorities in the National Assembly have given Fifth Republic governments the ability to develop mandates, and carry through their promises. Even the relatively weak governments lead by Raymond Barre between 1976 and 1981, and the minority governments of Michel Rocard, Edith Cresson and Pierre Bérégovoy between 1988 and 1993, were able to gain their essential objectives by using the array of questionable tools provided by the Constitution to push through legislation. This mode of governing is made possible by support that has grown through the years for the strong executive. The "malaise" that has been widely analyzed during the past few years has reflected a lack of confidence in political leaders and political parties, but *not* political institutions.

This strength of formal executive power and regime consensus only highlights the periodic effectiveness of protest movements in vetoing, modifying or postponing important legislative efforts, and this paradox is highlighted even more by the periodic effectiveness of immigrant protest. Movements by and/or in favor of non-citizens, the most politically marginal and weak actors, would, on their face, seem to be destined to be suppressed or to fail. If we can understand the success of these movements, then we may be able to draw some general conclusions about the relationship between protest and politics.

In this paper, I will examine three protest movements initiated by immigrants in France. I will look at the movements, their origins, organization and outcomes, and focus on the relationship between these movements and the policy-making process.

Resources and Opportunities

Patterns of protest in France imply two questions on which we will focus in this paper. The first is the question of why the weapons of the weak appear to be so effective against strong and coherent governments. The second is why some movements succeed while others fail. From the point of view of the actors, protest is a way of mobilizing resources, a way that organizers have of strengthening their influence, either directly or indi-

rectly, in the policy process. Protest can, therefore, be seen as an aspect of "ordinary" politics-- by other means.[3]

The success (and the initiation) of protest movements has been analyzed in terms of "structures of opportunity" within the state and political system which, according to Sidney Tarrow, encourage the protesting group to mobilize its resources and are related to the success of the movement.[4] Opportunity structures are both constant and variable. Relatively constant opportunity structures include the degree of openness of the political system[5] , the degree of centralization of the system, and the structure of the party system. More variable structures include: the stability or instability of party alignments;[6] the presence of allies or supporters among political elites;[7] political conflicts within and among elites.[8]

It would appear that the variable aspects of the opportunity structure reflect the conflicts within the government and the state both with regard to general policy, and with regard to the issue at hand. In the first instance, the issue at hand is used by political elites in ongoing conflicts; in the second, the issue creates or becomes a vehicle for new alliances. In both cases, elites are not simply passive actors in an opportunity structure, but also shape this structure by their response to protest.

The question is not simply how these structures are viewed from below, but how they play out from above. Protest literature

focuses on how variations in the opportunity structure encourage protest movements, and contribute to their success. My interest here is somewhat different. I am most interested in how movements of direct action relate to elite behavior, as well as how the actions of elites mold the protest environment: the relationship between the way policy is developed within institutions and among elites, and the way that movements of protest emerge and develop from below.

In France, the more constant elements of the opportunity structure seem to militate against the possibility of protest. A high degree of centralized decision-making, combined with a relatively closed political system and a stable core of political elites, remote access to decision-making, and considerable protection for the targets of protest, provide little encouragement for mobilization. On the other hand, the fragmentation of the party system and changing political alignments in France work in the opposite direction, and political conflicts within and among the (stable) core of political elites in France have generally encouraged and supported protest movements.

THREE CASES OF DIRECT ACTION AMONG IMMIGRANTS

Since the 1970s, there have been three important cases of direct action among and on behalf of immigrant groups in France. The first was a long rent-strike of immigrant workers living in

state supported dormitories that began in 1973 and lasted, through various phases, until 1980. This was the first important movement initiated by immigrant workers themselves, and eventually involved unions, state agencies, political parties and the government. The second, was a series of immigrant-initiated strike movements, first from 1975-80, and then in 1982-83 (I will look at the second wave), which appeared to portend the emergence of ethnic conflict in France. Finally I will look at SOS Racisme, the movement that emerged in 1984 as a result of aseries of anti-racist youth marches. Its dynamic leadership quickly established close links with the governing Socialist Party, and became an important conduit for the government for the development of policies on immigration.

From each of these cases of direct immigrant action, we can learn something different about the relationship between direct action and the policy-making process. We can also analyze those elements that are common to immigrants, and are different from direct action among other groups, as well as elements that these cases have in common with other French patterns (such as those analyzed in other papers on this panel). I will argue that each of these movements had an important impact on the structure of decision-making, and that each was part of a process through which immigrants were integrated into institutions involved in the political system. I will also argue that in each movement immigrants provided the expressive motor-force that was harnessed

in an instrumental way by existing political elites. However, each movement also resulted in unanticipated and unintended consequences, not necessarily consistent with either the expressive spirit of the protest or the instrumental objectives of existing elites.

1. The SONACOTRA Rent Strike

SONACOTRA (the National Association for the Construction of Housing for Algerian Workers) had been established in 1956, as a *société d'économie mixte* to build and administer housing "for French muslims from Algeria who have come to work in France", and was funded in part by credits from the French government. The purpose of the agency, apart from building and administering worker housing, was to limit the recruitment of the FLN, which recruited heavily in the slums populated by Algerians on the outskirts of Paris. After Algerian independence the name (but not the acronym) of the agency was changed to eliminate "Algerian," and its mission was changed to include workers in general.[9]

The SONACOTRA expanded as part of a larger program of the French governments that dated from the early years of the Fifth Republic, to eliminate the shantytowns that surrounded large French cities, and that were inhabited by large numbers of foreign workers (largely Portuguese at this time). By the late 1970s, most shantytowns had disappeared, and about 170 thousand immigrants were housed in units administered by SONACOTRA, and

200 thousand in low income housing sponsored by other agencies (HLM).[10] Although the dormitory housing depended on state subsidies, they were expected to recover their maintenance costs from rents (called "share of the running costs") charged to the residents.

During the 1970s, the structure of the immigrant population in France was in the process of changing. In general the dominant population of mobile immigrant workers was giving way to a more sedentary population of families. The suspension of immigration in 1974 encouraged this trend by favoring family unification, and making it more difficult for workers to leave and reenter the country. Nevertheless, particularly among North Africans, adult males living in France alone without their families still predominated in the mid-1970s.[11]

The SONACOTRA conflict had all of the earmarks of a protest movement. It was a direct (not representative) collective action, whose participants, at least initially, rejected institutional mediation. Its initial aims were disruption of normal processes, an attempt to break through the bureaucratic morass, an attempt to be heard. The movement was broadly expressive, and demands, as we shall see, were often "couched in symbolically charged and non-negotiable terms." Nevertheless, their demands did impinge on political elites, and the participants were strategic in their choice of issues, targets and goals.[12]

Between December, 1973 and July, 1975 the residents of three immigrant worker dormitories in the Paris region initiated rent strikes in protest against increases in rent, and against living conditions in the residences. The movement might have been quickly defused, if the directors of SONACOTRA had agreed to negotiate with their clients. Instead, they refused. "We don't discuss [policy]," argued one manager, with people who come from huts."[13] Although the strikes were related to one another, it was not until July, 1975 that a committee was established to represent the workers in their negotiations with the directors of the SONACOTRA. Informal contacts had failed to produce any results, and rents were increased once again at the end of the summer. The new move provoked the spread of the strike to other dormitories, and a new Coordination Committee was formed, consisting of delegates from each of the striking dormitories.

The first committee had been formed by the C.G.T. of the department of the Hautes-de-Seine, and was closely linked to the Communist Party. The party, was playing a role that it had played since the 1920s, representing the interests of immigrant workers, but, in this case, its links to the North African workers on strike in the dormitories were weak and fragile. The new committee, which did not displace the C.G.T.-dominated committee, was more representative of these workers, and employed a more radical (gauchiste) vocabulary in its formulation of

demands; it also claimed to be the sole representative of the striking immigrants.

The competing claims were put to the test in December, when the Hautes-de-Seine committee, with the approval of the Amicale des Algériens en Europe (the Society of Algerians in Europe) signed an agreement with SONACOTRA on behalf of the first dormitory that went out on strike in 1973. The accord granted many of their demands for rent reductions, but was immediately denounced by the rival regional coordinating committee, which now claimed to speak for 37 dormitories on still on strike. The C.G.T., the P.C.F. and the Amicale were all denounced as traitors, and, by the end of the month, the strike had spread to another 13 SONACOTRA dormitories. There were now 1200 residents in 50 dormitories participating in the movement. During the first few months of 1976, the strike continue to spread throughout the Paris region, eventually to 238 dormitories. The Coordination Committee appeared to have won the battle over representation.

Nevertheless, SONACOTRA, which was quite happy to negotiate with the C.G.T., denounced the representivity of the Coordinating Committee. The claims of the committees went to the very core of what these workers were. The C.G.T. represented them as workers; the Amicale, as foreigners on French soil; but the Coordination Committee claimed that they were essentially *immigrant workers*, with special needs. By 1976, their demands had gone well beyond the reduction of the rents; they claimed the right to form their

own autonomous renters' association as well as improved living conditions. Moreover, although most of the striking workers were North African, participants also included many Black Africans and Portuguese workers.[14]

Beginning in February, 1976, the movement moved into the political arena. For the first time, the Coordination Committee called a mass rally (at the Mutualité) in Paris, attended by 3500 strikers and supporters. The rally was covered extensively by the press (the first time that this had happened). The Government, which had remained on the periphery of the negotiations until now, then moved to deport several dozen of the strike leaders on Good Friday; a poor choice of days, since it provoked angry statements from a combination of the Catholic Church (the Arch-Bishop of St. Denis), Jean-Paul Sartre, Simone de Beauvoir, François Mitterrand, Jean-Pierre Chevènement, as well as the PCF, the CGT, the CFDT (which demanded to see the prime minister). In March, 1977, the Council of State overturned the deportation orders for most of those concerned (who then returned to France--adding fuel to the political mobilization effort). Nevertheless, large numbers of deportations were confirmed on the grounds of the disturbance of public order.[15]

Perhaps the most interesting reaction to the expulsions came at a press conference on May Day, 1976, at the end of a week of demonstrations throughout France organized by all of the major trade unions, together with the Amicale. The President of the

Amicale, speaking for this coalition that had been denounced many times by the Coordination Committee, reaffirmed his unqualified support for the strikers, but carefully noted that

> ...it is useful to emphasize that our organization has never pretended to substitute itself for the group of immigrants whose diversity of nationalities limits in fact our ability to act in a role of active intermediary, directly interested in the satisfaction of the legitimate needs of the residents.[16]

At the same time, he denounced the

> ...irresponsible leaders if certain extremist elements, who are preoccupied little with the with the outcomes of the claims of the residents, and are only interested in creating a permanent center of agitation in these hostels.

The trade union leaders concentrated their fire against the government and the SONACOTRA, but the press conference in fact revealed the outlines of the challenge confronted by the those who regarded themselves as the legitimate representatives of the interests of the strikers. Both the CGT and the CFDT were forced to affirm their support for the right of immigrant association at the same time that acted on their behalf.[17]

During the summer of 1976, a second accord was signed between the dormitory authorities and the trade union committee, and this one seemed to hold for a few months, until the Fall of

1976, when new demonstrations and rent strikes were organized by the Coordination Committee. The trade union committee continued its negotiations with the SONACOTRA, but the conflict continued in the Paris region until mid-1980 (in late 1979, almost a third of the dormitories in the Paris region were closed because the residents refused to pay rent increases), when settlements were reached in most cases. In fact, it is difficult to give a precise date for the end of this movement, since each time it seemed to be ending, it would reemerge a few months later. The very complexity of noting the end is an indication of the endurance of the movement.

Like most movements, "success" cannot be judged simply in terms of its evolving objectives. Rents that were reduced at some points were raised at others, but living conditions in the residences themselves seem to have improved. However, the *process* of the movement did alter the political landscape in ways that were not entirely predictable at the beginning, and in ways that did not entirely work in favor of the immigrant workers themselves at the end.

Because SONACOTRA (and the government) refused to acknowledge the Coordination Committee as a legitimate representative of the striking immigrants, it was forced to deal with a trade union committee that had only limited influence over the participants in the movement. The ability of the Coordination Committee to survive attacks from both the government and the trade unions,

gave it added weight among the striking workers. In the end, the strikes cost the state about 50 million dollars in lost rents, not counting increased subsidies that the state paid to the lowest paid workers to offset the rent increases.[18] The state also expanded its efforts to provide low-income housing for immigrant workers and their families. Finally, the precedent of immigrant workers of different origins working together served to solidify subsequent movements against government actions, particularly the Bonnet proposal to tighten police powers of expulsion and the Stoleru proposal to discontinue permanent work permits (both were severely modified as a result of decisions by the Council of State and the Constitutional Council, and ultimately repealed by the Socialist government in 1981).

However, there were unanticipated consequences that are linked to the movement. On the issue of housing, the effective positions of the right and left were reversed in the late 1970s. During this period, the central government of the right was drawn into the position of defending subsidized housing for immigrants, while the local governments of the left attempted to resist or limit its expansion.[19] On the other hand, when, in order to assert its authority in this area, the government attempted to impose increased restrictions on immigrant rights and to restrict entry in a variety of ways, the effort was strongly resisted by the Left opposition.

Another unanticipated consequence of the conflict was masked by the Maoist tendencies of the Coordinating Committee:

> The leftist and marxist language used by the Coordination Committee, [notes Jacques Barou, contributed to hide the islamic aspect of this conflict, which, though never underlined by the media...was nevertheless quite present....Between 1974 and 1979, when the conflicts were almost uninterrupted, this demand for space for prayers was so systematic that it was anticipated by the directors concerned, who budgeted in all of the dormitories construction to respond to this need. We must also take into account the fact that, for the directors, it was one of the demands that was easiest to satisfy and the its satisfaction seemed to bring back a semblance of order.[20]

By 1986, 80 percent of the dormitories run by the SONACOTRA had built Islamic prayer rooms, which served religious purposes, but also served to reaffirm islamic identity in a broader sense. Favored by managers in the 1970s because they linked Islam with order, Islamic expression was also favored by the leftist organizers of the SONACOTRA strikes because they viewed it as a means of promoting solidarity. Thus the widespread demand for prayer rooms met virtually no opposition.

On balance, the movement was linked to the development of national policy on immigration both directly and indirectly. The

direct link was relatively narrow: the involvement of the government in the settlement of the strikes over a five-year period. The indirect links are related to the process through which the movement evolved. The SONACOTRA movement had its own dynamics which ultimately involved these workers-- many of whom were not French citizens, did not vote, and had few resources with which to assert their demands-- in the conflict between the government and the organized opposition. The broader policy response of the government was related less to the movement itself than to the process that had been set in motion by the movement, and, in this sense was indirectly linked to it. The choices of the government were not preordained, but were, nonetheless, constrained by the new political environment that resulted from the movement.

2. The Auto Strikes of 1982-83

During the 1970s immigrant workers gained more or less full access to trade union rights. Legislation passed by governments of the right in 1972 and 1975 granted immigrants the right to vote in "social" elections for shop stewards, union representatives and plant committees. The 1975 legislation, moreover, permitted them to stand for election and to hold office in trade unions themselves, provided that they were able to "express themselves" in French and had worked in France for at least five years.[21] Paul Dijoud (Giscard's Secretary of State for Immigration) referred to the new legislation as a "confirmation of the

government's dedication to assuring the equality of social rights between foreign and French workers."[22]

Nevertheless, the rates of unionization remained low among immigrant workers, even lower than those of native workers. It is estimated that only about ten percent of immigrant workers belonged to any union in the 1970s, less than half the percentage of native workers. However, this overall discrepancy can be explained in part by the concentration of immigrants in industries with relatively low rates of unionization. In sectors in which rates of unionization were higher (textiles and metalworking), the discrepancy was much narrower.[23]

During the period after the victory of the Left in May and June, 1981, there was a decline in strike activity, with the exception of the automobile sector, in plants in which there were large number of immigrant workers. The immigrant workers who went out on strike between the fall of 1981 and the spring of 1983 were, for the most part, the most endangered workers in an endangered sector: assembly line workers in a shrinking industry. Like many intense strikes in France, this movement that lasted a year and a half began with non-unionized assembly line workers in two Renault plants: Billancourt and Flins. In both of these plants, immigrant workers constituted over 50 percent of the blue collar work force, concentrated on the most redundant assembly line work.

By 1981, international competition had begun to take its toll on the French auto industry. The combination of job cutbacks and assembly line speedups provoked a three-week walkout in Renault-Billancourt in October, 1981, a precursor as it turned out, to a larger strike wave in the spring and fall of 1982, and then the winter and spring of 1983. The press reports sometimes referred to these strikes as "the May-68 of the immigrants."

What made them most notable, perhaps, was the fact that they were almost the only large strikes that lasted for long periods of time during this period. In fact, at a time when union membership was in sharp decline, when union influence among French workers was declining as well, when unions were increasingly viewed as "too powerful," and when the frequency and amplitude of strike action was diminishing, these immigrant strikes were widely seen as a (hopeful) sign of mobilization by commentators on the left.[24] They were also notable because, generally standard demands were frequently posed in terms of "dignity," leading commentators to refer to the most bitter of these strikes (especially the strikes at Citroën and Talbot) as "the springtime of dignity."[25] It appears that speedups and changes in work-rules provoked the strikes, but that most of the demands that were finally negotiated involved financial settlements of some kind.[26]

The strikes themselves generally followed a well-known pattern of French strike movements. First, they were initiated

"at the base" by small groups of non-unionized workers, and gained the support of others. Thus, the conflict at Citroën-Aulnay began with a remark by a foreman to an assembly line worker on April 22, 1982, reported as: "I don't discuss things with slaves, with *bougnoules* [a pejorative name for North Africans]." An hour later, several hundred workers had walked out.[27] The strike lasted until June. At Renault-Flins, the strike was initiated on January 6, 1983 (the second strike in less than a year) by a few hundred mostly immigrant workers in the paint shop with the support of CFDT (the leading union in the plant). The strike movement soon spread to other shops in the plant (in part because production was halted).

Second, the strikes caught the unions by surprise. This was particularly true at Citroën, which was dominated by a company union, and where the established unions were particularly weak. The unions then attempted to "canalize" the movement, to act as intermediaries with management (and state authorities), and competed with one-another in acting in this role. Nevertheless, in no case did the unions dominate the strike process.

> But the conflicts in Flins and Billancourt show that the unions are not the masters of the game. The strikers have imposed their own will: "It is the workers who have set off the strike who must decide about return to work" affirmed a spokesman for the strikers in Flins, the majority of whom are immigrants.[28]

In this context, the role of the union delegates from the different centrals varied. The CGT tended to be more open to negotiation in Flins, while the CFDT tended to "stick" closer to the striking immigrant militants.

Finally, the movements lost steam, and settlements were reached with at least short-term gains for the striking workers.[29] Although they were not generally depicted by the unions or the workers themselves as "immigrant" struggles, there were aspects of this movement that were specific to the workers as immigrants that we shall explore below. Less obvious, however were the changes that had broader implications for the immigrant workers as a group, and their relationship with the trade unions that were increasingly dependent upon their support, especially in declining industries.

Thus, these strikes marked the integration of North African workers into the more general working class conflict, but with conditions specific to who they were. Research conducted during this strike period shows a permanent tension between two goals for the unions:

> One hand the recognition of worker individuality, and thus of foreign identity, without which the union cannot be firmly entrenched in its "base," ...; on the other hand, the elimination of ethnicity, age, and sex in the search for a broader legitimacy and representativeness. [30]

The result was a compromise, both in the process of canalizing the strikes, and in the settlements that were reached.

In each of the strikes in the auto industry, the motor force behind the organization and definition of the movement was a committee of the striking workers themselves, a committee that remained more or less apart from the union delegates. In April, 1982 in Flins, it was called "the strike committee," in April-June in Citroën-Aulnay, the "delegates for struggle." In each case these committees that had the confidence of the strikers performed intermediary roles that ranged from language interpretation to bargaining interpretation and intermediation. In some earlier cases (Usinor-Dunkerque in the spring of 1981), these committees had presented themselves as alternatives to the established unions, but during the strike wave of 1982-83, their actions were "canalized,' if not controlled by the unions. In the end many of their members were integrated into the CGT (most frequently) and the CFDT.[31]

In this sense, the strike movement was an organizational success for the unions, particularly the CGT. It was also an organizational success for the immigrants, many of whom, sponsored by the unions, became shop stewards and members of plant committees during the period after the strike movements.[32]

This pattern is part of a more general struggle by unions to come to terms with the "different," specifically the Islamic aspects of North African workers. In some plants (particularly

Renault) CGT has been a more active supporter than CFDT of specifically religious demands of Muslim workers. During the 1970s, in response to what they perceived as attempts by the government and by management to use Muslim workers to weaken the bargaining strength of the unions, the CGT attempted to mobilize and integrate them by supporting demands for religious practice in the workplace.[33] During the 1980s the union has continued to support "cultural demands" with more enthusiasm than the CFDT, which has been more wary of supporting such demands.[34]

On the other hand, the CGT has been more wary of the independent strike committees organized by immigrant workers, and the 1982-83 strike wave marked the first time that it was successful in both working with them and, ultimately bringing their leaders into the union. But, the larger picture is less sanguine. Since the 1960s, the proportion of immigrants among the delegates at the national congress of the CGT has increased somewhat, but in 1985 still only represented just over 6 percent of the those present (down from 8 percent in 1982).[35]

Nonetheless, we would argue that the strike movement of 1982-83 were an important step in forging a relationship with immigrant workers and the trade union movement. Even if some of the gains proved to be temporary (all of the plants concerned continued to reduce employment, particularly among the workers who spearheaded the movement,) and the penetration of the union organizations was slow and marginal, the movement was a *conflict*

révélateur of the changing structure of the French working class, and the changing structure of the trade union movement. By most measures, these strikes were successful because of the relationship between the striking workers and the unions.

There was another aspect to this movement that is more difficult to analyze. The government was not directly involved in the negotiations during the strike movement. Nevertheless, its indirect involvement was important. Like any important strike movement, this one was imbued with political meaning and political consequences. It was a direct challenge to the emerging austerity policy of the Socialist government, and it came in the midst of the debates over lois Auroux and the first electoral breakthroughs of the National Front. the strike movement also came during the runup to the important municipal elections of 1983. The Minister of Labor, M. Auroux, strongly supported the proposals of the director of Renault (a nationalized firm under independent management), and state mediation finally ended the strike at Citroën-Aulnay.

Clearly, even for a Socialist government that would normally be somewhat sympathetic to the poorest workers fighting for their "dignity," this strike movement was a political problem. But the way that it chose to focus on the problem was unexpected. In the runup to the March, 1993 local elections, the prime minister, the minister of labor and the minister of the interior all interpreted the strike movement as a challenge of fundamentalist Islam.

Thus in speaking of the conflict at Renault, Prime Minister Pierre Mauroy distanced this strike from a "normal" strike, by declaring that

> ...the main difficulties that remain are posed by some immigrant workers who, without disregarding the problems, ...are agitated by religious and political groups who are guided by criteria having little to do with the realities of French society.[36]

A few days later, the Minister of Labor drove the point home in more explicit and ominous terms:

> There is evidence of a religious and fundamentalist element in the conflicts which we have encountered, which gives them a slant not entirely confined to trade unionism. Having said that, we live in a secular state and we expect things to remain as they are. I am against the institutionalization of any religion inside the place of work. I am against religion in the workplace just as I am against politics in the workplace.[37]

At the same time the Minister of the Interior spoke darkly of "fundamentalists" and "shiites."

Islamic demands were not important in the 1982-83 strike movement, and there was certainly no evidence of "outside agitators." Moreover, in terms of the norms of the French trade union movement, the pattern of these strikes was certainly quite

orthodox and expressed a set of demands that were universal and not particularistic in content. Nevertheless, the claims of the government were meant to transform the meaning of the strikes at a time when it was engaged in an electoral campaign in which immigration was becoming an important issue, and in which the minister of the interior was involved in a local contest in Marseilles in which this issue was of pivotal importance. Indeed, at the time, Defferre was arguing that he, as minister of the interior, he was best placed to combat immigration. Thus, in an unanticipated way, the movement fed into the politicization of the immigration issue in France.

3. SOS Racism

The case of SOS Racism is quite different from the previous two cases, different in terms of origins, different terms of participants, different in terms of process, and, in significant ways, different in terms of outcomes and consequences. The organization emerged as a reaction to the rise of the National Front in 1983 and 1984, at the culmination of a series of anti-racist marches and demonstrations by "second generation" North African youth. The marches themselves had attracted considerable media attention, and the organizers of the movement were strongly attuned to the uses of media and publicity.

SOS rapidly became a holding company of diverse communities of immigrant youth (lycée and university students, for the most

part), united by a broad commitment to fight the tide of racism that accompanied the expansion of the National Front. Throughout France, in housing projects, lycées and universities, the movement established *points-stop racism*.[38] In part, the rapid spread of SOS can be accounted for by the fact that soon after its founding, it began to work with established anti-racist organizations and student groups of all kinds (including the Union des étudiants juifs de France- UNEJF). The "tuned-in" (*branché*) style of the leadership facilitated the penetration of lycées and university centers by SOS.[39]

But the leaders of the organization were particularly skilled in mobilizing media coverage of its high-profile marches, concerts and events. Indeed, Marie Poinsot has argued that the great innovation brought by SOS-Racism was its systematic use of the media for organization and mobilization.[40] The anti-racist movements in 1983-84 promoted the founding of SOS Racisme, but SOS organized around the use of the media to magnify its mobilization capacity.

> Even with pretty weak elements, we were prepared to feed something to the journalists who were always camped at the door of the association...The words, the events, the "actions," everything was used in terms of monopolizing the media,

argued a former member of the Paris association.[41] By 1985, SOS became the primary spokesman for racist incidents for which the

media needed a reaction. The face of Harlem Désir was frequently on the screen, and the organization became both visible and privileged.

Also, by 1985, SOS-Racism had established a firm link with the Socialist Party.

> Thanks to the machine of the Socialist Party, a solid implantation of several dozen committees of SOS was rapidly put in place across France. It was essential to have this advantage because, in all future actions, we would need their cooperation to mobilize the masses.[42]

In fact, Malik notes that many of the local committees were composed of "a few guys from the PS or of the Ligue Communiste," and Poinsot confirms the close links with the PS in the Nord region around Lille.[43]

Within a few years after its founding, SOS Racisme had also stimulated the founding of competitive organizations of North African youth-- notably, France Plus. France Plus, more oriented towards traditional republican values of "individual integration into the nation," and the placement of North African candidates on lists in local elections, has provided considerable competition for SOS both nationally, and, especially, locally. It has also successfully competed for support within the PS-- particularly among the Rocard wing of the party. In fact, the electoral work of France Plus has helped it establish firmer local roots compared with SOS Racisme. As Marie Poinsot notes:

> At the end of this decade, SOS Racisme therefore remains a national actor without a solid anchoring in the region of the Nord, since it is only the local media that relate in their columns the statements of the parisien association in the area of anti-racism. The formation of a local audience among the youth of Lille has not happened.[44]

Nevertheless, SOS Racisme has become an institutionalized political force. It is an established presence on the French political scene, a recognized representative organization that is part of the continuing dialogue on racism and immigrant policy. The institutionalization of SOS was the beginning of a more general shift in *intérlocateurs valables* among groups claiming to represent the interests of North African immigrants, from French organizations and *amicales* linked to the North African governments, to groups with roots among the so-called second generation of immigrants.

IMMIGRANTS, PROTEST AND FRENCH POLITICS

The three protest movements discussed in this paper were all successful in several ways.

1. Institutionalization of Representation

During the long rent strike at SONACOTRA, immigrant militants in the Coordination Committee became important actors in

political bargaining for the first time. Although they were opposed by both some trade union leaders and the directors, they maintained the confidence of the participants. The tension between the union representatives and the immigrant committee probably prolonged the strike, but also established the prerogatives of the immigrant representatives, at least informally.

By 1982-83 these same tensions, this time in the context of industrial action, were worked out in a way that benefited both the striking immigrant workers and the trade unions involved. The immigrant strike committees generally worked well with the union organizations. In the case of SOS Racisme, the rapid institutionalization of the movement was related to its ability to relate well to the media, but also to other French organizations that were dealing with the problems of racism.

2. Gains and Objectives

Each movement was also a success in the gains that it was able to obtain for the immigrant participants. Conditions *did* improve at the SONACOTRA dormitories, and the government *did* make a larger commitment to immigrant housing. The strike movement was surprisingly successful in the gains that it made in the midst of a policy of austerity. The success of the SOS cannot be measured in the same terms, but the representatives of SOS did gain access to the decision-making process on immigration.

In fact, the pattern that these movement indicates is different from that of most protest movements in France. Unlike most movements, these are closest to the "cycle" of protest analyzed by Sidney Tarrow.[45] Protest in France is either part of the "normal" pattern of trade union action (and periodically the action of other groups as well), or the sporadic movement of what is referred to as the "social climate." Only rarely does protest result in the incorporation of new groups into the political system. In this case, the net effect of these three movements was to institutionalize immigrant representation in the trade unions, and to include immigrant actors in the polity.

A second significant difference between these movements and most other protest movements in France is that there were positive gains. Many, though certainly not all, protests are attempts to veto policy changes, and prevent the government from doing something it has already done, or intends to do. The SONACOTRA strikes began as an attempt to push back a rent increase, but as the strikes went on, the demands broadened.

But how can we understand the success of these movements, and what can we learn more generally about protest movements in France?

1. Elite competition

In the two strike movements, the immigrant participants had the support of both the CGT and the CFDT. The strikes initiated by the immigrants on trade union turf were a challenge to their

authority that could not be ignored. The competition between the unions in an environment of declining union confidence among workers guaranteed an elevated sensitivity by union representatives to immigrant concerns. The stakes of these movements for union elites were different than they were for the immigrant participants, but success was important for both.

2. The Fragmented Party System

Although the French political system is relatively closed, and decision-making is still relatively centralized, the fragmentation of the party system constantly offers opportunities for protest movements of long duration. The SONACOTRA strikes became part of the continuing struggle between the government of the Right and the Left opposition in the 1970s, but the striking workers also attracted the support of sympathetic deputies from the governing parties.

The strikes in 1982-83 seriously challenged and embarrassed the Socialist-Communist government of the Left, but also created divisions both between Socialists and Communists, and among the Socialist ministers. The statements by the prime minister, the minister of the interior and the minister of labor were opposed publicly by the secretary of state for immigration. The creation of SOS Racisme was supported by the governing Socialist Party at the time, but after the emergence of France Plus a year later, both organizations became linked to different wings of the party.

The fragmented party system offered both opportunities and posed problems for each of these movements. The links that developed between these movements and the parties or party factions strengthened the movements in some ways, but also made them more dependent on party priorities.

3. Centralization

Given the fragmentation at the center, the centralization of decision-making in France tended to magnify the importance of these movements, and of protest movements in general. All of the bargaining to resolve the strike protests quickly moved to the top, and involved government officials either directly or indirectly. Thus, once elements of the center became involved, it became more important to resolve the conflicts, even if concessions were made.

Therefore, I would argue that the variations in the opportunity structure in France are important for understanding these movements and others as well. Nevertheless, the dynamics at the top have a life of their own, and it would be useful to look at these movements through the eyes of elite actors, to understand why they reacted in the ways that they did.

I

Perhaps the two best-known regime categorizations are those of Aristotle and Montesquieu. In place of Aristotle's three good regimes (kingship, aristocracy, polity) and their corresponding perversions (tyranny, oligarchy, and democracy), Montesquieu speaks of republics, monarchies, and despotisms. In essence, he keeps kingship and tyranny under the names monarchy and despotism, while collapsing aristocracy, polity, oligarchy, and democracy into the one category of republic. The distinction between the few and the many, so crucial to the conduct of ancient politics, is simply elided by Montesquieu. Moreover, while there exists a good form and a bad form of rule by one, republics are simply republics. Montesquieu makes no categorical distinction between healthy and corrupt republics. We have to wonder why not? We know that Montesquieu's distinction between monarchic and despotic government hinges on the status of the law. A monarch rules "by fixed and established laws," whereas a despot "draws everything along by his will and his caprices" (II.1).[1] Montesquieu noticeably refrains from using the word "sovereign" in speaking of the monarch (II.4); however, he uses it repeatedly in speaking of a republican people (II.2). Moreover he defines popular sovereignty in terms of will: "The sovereign's will is the sovereign himself" (II.2). Remember that despotic government was also defined in terms of will. Perhaps it is impossible for a sovereign people to be bound by law in the way that a constitutional monarch or chief executive can be. With

[1]References to The Spirit of the Laws are by book and chapter number in the text. I have used the translation of Anne M. Cohler, Basia Carolyn Miller, and Harold Samuel Stone (Cambridge: Cambridge University Press, 1989). References to the Persian Letters are by number in the text (e.g., #51). I have relied on the translation of George R. Healy (Indianapolis: Bobbs-Merrill, 1964), making occasional emendations wherever I thought greater literalness imperative. References to other works by Montesquieu are to the two volume Pléiade edition of the Oeuvres complètes, edited by Roger Caillois (Paris: Librairie Gallimard, 1949-51) cited by volume and page number (e.g., II:39), with the exception of Mes Pensées which are by number in the text (e.g., no. 115); translations from these works are my own.

great subtlety, Montesquieu hints that a republic, in which the sovereign people, be they few or many, are unbounded by fundamental laws, bears a certain similarity to despotism, in which the will of one is unbounded. In other words, in eliding the difference between the few and the many, Montesquieu has not substituted the distinction between the one and the many as the most relevant regime characteristic. The essential factor is the unity or separation of power. Monarchy properly understood is a regime of separated powers, where there exists what Montesquieu calls "a depository of laws" (II.4), essentially an independent judiciary. The point of Montesquieu's new categorization of regimes is to move beyond the question of number (one, few, or many) and beyond the question of what Montesquieu, in an explicit criticism of Aristotle, calls "accidental things, like the virtues or the vices of the prince" (XI.9). Already, Montesquieu can be seen moving toward the question of constitutional order and a government of laws not men. As The Spirit of the Laws unfolds, the fundamental regime distinction will become that between despotic and moderate government.

Despite its familiarity to us today, Montesquieu's usage of the term "despotism" was unique and constituted a significant departure from both ancient and early modern usage. It is Montesquieu who more than any other thinker is responsible for the onus that now attaches to despotism. Although "despot" and "despotic" were part of the political lexicon of the Greeks, their meaning was not always pejorative. "Despotēs" was the Greek term for "master" and despotic rule proper was that exercised by a master over his slaves. To the extent that slavery was regarded by the Greeks as just, despotic rule had its legitimate sphere in the household. It was only when a ruler sought to treat free men as slaves that "despot" became a term of abuse. Aristotle, for instance, in his categorization of regimes, refers to all three

corrupt regimes as despotic.[2] In general however, the ancients spoke much more frequently of tyranny than of despotism. One of the great achievements of classical political science was its analysis not simply of the tyrannical regime, but of the tyrannical soul. Although the ancient authors gave memorable accounts of the methods of tyranny, those accounts were in some sense ancillary to the more fundamental inquiry into the motivations to tyranny.

Given the power of the ancient analysis of tyranny, perhaps it is not surprising that, of all the Greek words for political things, "tyrant" and its cognates were the only ones to be adopted into Latin. For the duration of Latin's sway, "despot"--that other Greek term of political corruption--languished. It was known of course to those who read Aristotle in the Greek; in Latin and Latin-influenced vernaculars, however, "despot" was translated into other terms: dominus, seigneur, or master.[3]

After this long neglect, it was Thomas Hobbes who reintroduced the original Aristotelian terminology into political discourse.[4] His intentions in writing of "dominion paternal and despotical" were, however, very un-Aristotelian. Just as Machiavelli had dissolved the Aristotelian distinction between kingship and tyranny, Hobbes, as the foremost apologist of absolute sovereignty, redefined "despotic," attempting to relieve it of any negative connotations. Hobbes' restoration of the term "despotic" was thus accomplished on the ground of a significant

---

[2]Politics 1279a17-21. Further at 1279b15-17 Aristotle defines tyranny as "the monarchic rule of a despot over the political association" (also 1295a17); at 1292a15-25 he describes democracies which become despotic and analogous to tyranny; at 1306b1-6 he speaks of oligarchies being overthrown when they become too despotic.

[3]For a fascinating philological tour, see R. Koebner, "Despot and Despotism: Vicissitudes of a Political Term," Journal of the Warburg and Courtauld Institutes 14 (1951): 275-302; also Melvin Richter, "Despotism," in Dictionary of the History of Ideas 2 (NY: Charles Scribner's Sons, 1973): 1-18 and Franco Venturi, "Oriental Despotism," Journal of the History of Ideas 24 (Jan.-March 1963): 133-42.

[4]Koebner, "Despot," 288.

moral abdication. According to Hobbes, despotical dominion is founded on the consent of those vanquished by force; and for Hobbes, that extracted consent does not differ from the consent of those who agree together to submit to a sovereign. Both types of consent are prompted by fear--whether it be fear of a conqueror or fear of one another. Hobbes concludes that: "the rights and consequences of . . . despotical dominion, are the very same with those of a sovereign by institution; and for the same reasons."[5]

Montesquieu was unwilling to follow the Hobbesian progression from the primacy of individual natural right to the doctrine of absolute sovereignty. He expressed his disagreement with the Hobbesian argument throughout his career, from his earliest to his latest writings. Of course John Locke also departed from Hobbes; but his departures--despite their tremendous practical significance--could be described as on the order of refinements, qualifications, and corrections. For Locke, individuals do not cede to the civil sovereign the full natural power which each man in the state of nature possesses to be his own judge and executioner. Natural right is inalienable. In Locke's view, men cannot be said to transfer their natural power to the sovereign; rather, in moving out of the state of nature men create a new kind of power: political power. On the basis of the distinction between natural and political power--the one unlimited, the other limited and divided into executive and legislative--Locke establishes more stringent standards for legitimacy. Unlike Hobbes, he denies the legitimacy of governments founded on conquest and usurpation and, accordingly, allows men recourse to a collective right of revolution against despotic or tyrannical authority. (It is true that Hobbes permits the man on the way to the gallows, whether justly condemned or not, to try to make off or otherwise resist. This may be an

---

exercise of an inalienable right to self-defense, but as to its efficacy we must judge it "too little, too late.") As a theorist of limited government, Locke took the first steps to make "despotic" once again a term of opprobrium.

Montesquieu's differences with Hobbes are more thoroughgoing than Locke's. Montesquieu rejects both elements of the Hobbesian paradox: the absolute liberty of the individual in the state of nature and the absolute power of the sovereign in the state of civil society. He rejects as well the mediating term between the extremity of liberty and the extremity of power: namely, the social contract. Whereas Locke sought to avoid the despotic Hobbesian outcome while retaining in large measure the Hobbesian account of man's origins, Montesquieu was duly impressed by their inseparability. He accepted the Hobbesian linkage of fear and absolutism. He did not, however, regard fear as the originating passion of all government. For Montesquieu, fear is the spring of one particular form of government: despotism. In effect, Montesquieu turns Hobbes' terminological innovation back upon him. Hobbes had retrieved the adjective "despotic," thinking to render it value-neutral; but Montesquieu appropriated it, and by capitalizing on its transformation into the noun "despotism," forged a powerful weapon against all forms of absolute rule, from civil slavery to domestic slavery to political slavery.

Montesquieu was the first political philosopher to embrace the neology "despotism" and to make it central to his thought. Although the Church had been employing the "ism" suffix for some time, producing such words as "paganism," "exorcism," "Thomism," and "atheism," and although both "humanism" and "Machiavellism" existed, there had not as yet been an -ism designating a system of government.[6] "Despotism" was the first. The study of political science today is largely a study of -isms; in the midst of our current welter of -isms, it is worth remembering and

---

[6]Koebner, 300-1, gives a brief history of the -ism suffix (yet another Greek contribution which Latin purists had long resisted).

reflecting upon the beginnings of this branch of nomenclature in the thought of Montesquieu.

We might wonder, for instance, at the significance of the shift from tyranny to despotism. Why does Montesquieu need a new word? What makes tyranny no longer serviceable? As I mentioned earlier, the ancient critique of tyranny was connected to a particular understanding of the human soul according to which the naturally ruling element of mind ought to govern spiritedness and desire. The tyrant possesses a soul gone awry, a soul lacking the proper articulation of its elements. His tyranny is but the simulacrum of his disordered soul. Tyranny is then a phenomenon traceable to the individual; it is the structure of the tyrant's soul writ large. Despotism, by contrast, is understood by Montesquieu as systemic or institutional. The despot himself is not the culprit. To put it in terms we are all-too-familiar with: he is a product of the system. Montesquieu's protagonist in the Persian Letters, Usbek, is just such a reluctant despot, a despot not by his own desire or design. Usbek is presented to us as an enlightened and virtuous man whom we nevertheless see authorizing and perpetrating horrible cruelties. We may say that Montesquieu's use of the term "despotism" in preference to "tyranny" acknowledges the ideologization of politics; in other words, Montesquieu finds the source of the political problem not in rulers, but in ruling doctrines. His critique of despotism is able to encompass the doctrines of both Christian divine right and Hobbesian natural right--no small feat, given the virulent anti-clericalism and thinly-disguised atheism of Hobbes. But Montesquieu saw that the Hobbesian system shares something fundamental with Christian dogma: the principle of fear. In the Christian dispensation, the fear of God is the beginning of all wisdom; in the Hobbesian dispensation, the fear of death is the beginning of all wisdom. Montesquieu implies that for men who have rejected the religious justification of rule, Hobbes' views

are a likely and dangerous replacement.[7] (Rousseau by the way, in his Social Contract, showed his understanding of Montesquieu's critique by classing Hobbes among the "Christian authors."[8])

For Montesquieu, the alternative to despotism is not a different -ism; it is moderate government, of which there are many varieties in accordance with the many varieties of the human spirit. Montesquieu, the most non-doctrinaire of thinkers, would not have welcomed our proliferation of -isms. Despotism was his only -ism, the one that should have discredited all others.

The critique of despotism runs through Montesquieu's entire corpus; indeed it might be said to constitute the ligaments of that corpus. The Persian Letters, while treating despotism comprehensively, takes up in particular the question of Christian monarchy's relation to despotism and Montesquieu's doubts of the stability or sufficiency of the monarchical principle. The Considerations on the Romans then traces the relation of ancient republicanism and despotism. Like monarchies, republics too (especially those which attain political greatness) are subject to collapse into despotisms. Moreover, the moral greatness of ancient republics bears a certain resemblance to despotism proper, such that we may speak of a despotism of virtue.[9] Accordingly, the movement in The Spirit of the Laws is from these

---

[7]In the Spicilège, Montesquieu notes that in certain cases the religious authorities have been the purveyors of Hobbes: "It is the abbé Dubois [cardinal and prime minister to the regent] who has corrupted the duc d'Orléans and has had him read Hobbes and other authors of that kind" (Pléiade, 2:1350).

[8]Rousseau, On the Social Contract, ed. Roger D. Masters, trans. Judith R. Masters (NY: St. Martin's Press, 1978), 127.

[9]Part 1, books I-VIII, lays out Montesquieu's tripartite scheme of governments (republics, monarchies, despotisms). Montesquieu dissects all three regimes, but particularly the ancient republic, the regime dedicated to virtue. Very gently, he uncovers the impossibility and the undesireability (indeed the inhumanity) of the ancient conception of virtue. The fundamental problem of the ancient republic is the contradiction between its nature and its principle. Its nature is to be governed by the will of the people; its principle is virtue understood as self-renunciation. As Montesquieu presents it, there is no lasting equilibrium possible between republican willfullness and republican austerity. The classical republic self-destructs.

three traditional regimes (examined in Part 1, books I-VIII) toward a new regime, one devoted explicitly to liberty. In Part 2, books IX-XIII, Montesquieu explores the possibility of a regime with a greater resistance to the gravitational pull of despotism. We learn of this new standard--liberty--and of a regime explicitly devoted to liberty--England--a regime which we might call a modern commercial republic. According to Montesquieu, modern republicanism differs from the ancient (and Christian) variety in being based on liberty rather than virtue, commerce rather than constraint.

II

The Spirit of the Laws, however, does not conclude with Montesquieu's famous teaching on the separation of powers and his elaboration of a decent penal law. He is interested in more than a generic blueprint for a constitutional order. In Part 3, books XIV-XIX, Montesquieu seems to turn away from the analysis of regimes. He inquires instead into the despotism of nature. We learn that despotism is systemic in more than an ideological sense. Montesquieu details the ways in which climate and terrain shape human character and laws, in many parts of the world virtually mandating civil, domestic, and political slavery. Montesquieu tempers our liberal universalism by showing us the natural obstacles to its realization.

Nature has a different meaning and place for Montesquieu than for Hobbes and Locke. Classical liberalism begins from an insight into man's asocial self-preservation in the face of other men's animosity and nature's stinginess. Hobbes places more stress on the former, Locke on the latter. But whether it is the fear of violent death or the problem of scarcity which is primary, Hobbes and Locke are alike in presenting a fundamentally optimistic rendering of the human situation. For despite the fact that "nature should thus dissociate, and render men apt to

invade, and destroy one another,"[10] the art and artifice of man can supply the defect. Man can bring together, or convene, what nature fails to; convention can remedy the inconvenience of nature. According to the guns and butter diagnosis, the human problem is soluble. The Leviathan neutralizes strife among men; and once the world has been made safe for the industrious, the bare endowment of nature can be rendered productive.

For Montesquieu, nature is not so easily overcome. We hear little of the movement from a state of nature to a state of civil society; instead, we encounter nature as a massive interruption, an outcropping. The six books of Part 3 are located squarely in the center of The Spirit of the Laws. Moreover, Montesquieu's "nature" is the real thing, not that logical construct--"the state of nature"--where man lives in the absence of government. Montesquieu is concerned with the elements and their enduring effect on individuals and institutions. We are shown to be formed by and adapted to our environment. Looking at that environment according to the old schema of the four elements, we might say that Montesquieu gives each element of the physical universe its due. There are four books on the relation of law and climate (air). There is one book on law in relation to terrain (the joint product of earth and water). Finally, there is one book on law in relation to the general spirit (which I believe might be analogized to fire[11]).

On the basis of this section, many have ascribed to Montesquieu a relatively crude naturalistic determinism. And indeed, he begins bluntly enough, explaining human character in terms of the slackness, extension, and sensitivity of fibers and nerves, as determined by heat and cold (XIV.2 "How much men differ in the various climates"). Most notoriously, he backs up

---

[10]Hobbes, Leviathan, 100.

[11]In the opening paragraph of book XIX, Montesquieu says he "must make daylight."

his climatological claims about the difference in temperament between northern and southern peoples with the record of an experiment he conducted on the papillae of a sheep's tongue. But even these somatogenic explanations are not as simplistic as they at first appear. The body is a complex organism; heat produces slack fibers (and hence, a cowardly heart), but lively nerves (and hence, an active imagination). We see that the influence of the climate is not simple or fixed. If the heat-extended fibers of Southern peoples render them timid, their heat-expanded nerves render them vivacious. Not surprisingly, the next chapter is entitled "A contradiction in the characters of certain peoples of the South." Here Montesquieu refers to the Indian practice of suttee, grimly remarking that "this is considerable strength for so much weakness" (XIV.3). Montesquieu explains how such willfull neglect of self-preservation might occur among the naturally faint-hearted:

> Nature, which has given these peoples a weakness that makes them timid, has also given them such a lively imagination that everything strikes them to excess. The same delicacy of organs that makes them fear death serves to make them dread a thousand things more than death. The same sensitivity makes the Indians both flee all perils and brave them all.

The message which emerges is thus not one of climatic determinism, but of the need for wise legislators, who can give a proper turn to the imagination: "The more easily and forcefully one is impressed, the more important it is to be impressed in a suitable manner, to accept no prejudices, and to be led by reason" (XIV.3). Moral causes may assume the ascendancy over physical causes by taking advantage of the ambiguity or multiplicity of moral effects. Of course, the success of such strategems depends on a sophisticated understanding of physical causes, and more particularly on an understanding of the interconnections between the physical and the moral.[12] In

---

[12]For Montesquieu's fullest treatment of the soul one would have to turn to his Essay on the Causes Affecting Spirits and Characters. There Montesquieu likens the relationship of soul and body to a spider in its web. The spider's

chapter ix, "A means of encouraging industriousness," Montesquieu illustrates how a legislator might counteract the laziness associated with hot climates. Since lazy nations are also usually arrogant, Montesquieu says,

> [o]ne could turn effect against cause and destroy laziness by arrogance. In southern Europe, where peoples are so impressed by the point of honor, it would be well to give prizes to the plowmen who had best cultivated their lands and to the workers who had been most industrious.

Something as simple as the institution of county fairs or the issuance of patents can be a powerful agent of economic, social, and political change.

In general, in Southern climes, one must temper the imagination and fortify the heart and stomach. In the North, by contrast, one must often strive to bestir a phlegmatic imagination. While the Indians take their lives under the influence of fanaticism, the English do so as a result of mental depression. In chapter 12, "On laws against those who kill themselves," Montesquieu argues against the punishment and stigmatizing of suicide in England on the ground that suicide there is "the effect of an illness":

> It is likely that there is a failure in the filtering of the nervous juice; the machine, when the forces that give it motion stay inactive, wearies of itself; it is not pain the soul feels but a certain difficulty in existence. Pain is a local ill which inclines us to the desire to see this pain cease; the weight of life is an illness having no particular place, which inclines us to the desire to see this life end.

Before the advent of psychotropic drugs and electroshock therapy

---

motion is communicated to the threads just as motion in the thread is communicated to the spider. The soul, on Montesquieu's metaphor, is not immaterial, since the body itself is spun from the stuff of the soul. The soul is instead a sort of ganglion--a sensate entity, a fuzzy, tentacled receiver and transmitter of vibrations. Crude and amateurish though they sometimes appear to us, these images of webs and fibers and reciprocal networks are used by Montesquieu to endow "matter in motion" with some real-life complexity, certainly greater complexity than the reductionist, billiard-ball model of kinetics offers. Montesquieu does on one occasion employ the billiard-ball model, but significantly it is to describe the motion of obedience in a despotism: "In despotic states the nature of the government requires extreme obedience, and the prince's will, once known, should produce its effect as infallibly as does one ball thrown against another" (III.10).

for the treatment of depression, intoxicating liquors and bloodsports were commonly used as physical restoratives. These measures work through the body to warm the imagination. There are also what we might call moral restoratives. In chapter 13, "Effects resulting from the climate of England," Montesquieu presents the rigors of freedom as a sort of moral restorative. It turns out that England's constitutional order is particularly suited to the constitutional disorder of individual Englishmen.

Most assuredly, Montesquieu points to the conditioned quality of human life. If English liberty is so linked to the morose and impatient English temperament and the rather insalubrious English climate, we can't help wondering what this means for liberty's prospects elsewhere.[13] How enslaving is the embrace of nature?

III

Montesquieu's initial consideration of the force of the climate in book XIV deals mainly with sub-political elements relating to care of the body: self-preservation, animal vitality, food, drink, disease, sex. If book XIV examines the bearing of the climate on life, books XV-XVII examine the bearing of the climate on liberty. Each of the next three books takes up a different form of slavery: civil (XV), domestic (XVI), and political (XVII). For the present, I shall confine my attention

---

[13]Shakespeare's Constable of France puts it thus:

> Dieu de batailles! where have they this mettle?
> Is not their climate foggy, raw, and dull,
> On whom, as in despite, the sun looks pale,
> Killing their fruit with frowns? Can sodden water,
> A drench for sur-reined jades, their barley broth,
> Decoct their cold blood to such valiant heat?
> And shall our quick blood, spirited with wine,
> Seem frosty? O, for honor of our land,
> Let us not hang like roping icicles
> Upon our houses' thatch, whiles a more frosty people
> Sweat drops of gallant youth in our rich fields--
> 'Poor' we call them in their native lords!
> --Shakespeare, Henry V III.v.15-26.

to book XV, "How the laws of civil slavery are related with the nature of the climate," inquiring more closely into what Montesquieu says about the most radical form of enslavement: property in man.

Montesquieu begins with a wholesale condemnation of slavery as "not good by its nature" (XV.1). Absolute mastery over another's life and goods is harmful to both master and slave. A life of compelled obedience deprives slaves of any opportunity for virtue. Meanwhile the master contracts the habit of tyranny, with its supercilious contempt for others, its petulance, its loosed and odious passions, its violence. Whereas the slave is harmed from without by having his virtue thwarted, the master is harmed from within, his virtue corrupted. Montesquieu spends more time detailing the injury to the master (given the extreme concision of his prose, one can attach significance to the difference between 10 words and 31). Characteristically, Montesquieu's condemnation of slavery appeals as much to the self-interest of the masters as to their philanthropy. In one of his pensées, Montesquieu says: "It is not with declamations that despotism needs to be attacked, but by showing that it tyrannizes the despot himself" (no. 1818). Jefferson employs the same method in his Notes on the State of Virginia, when he asserts that:

> There must doubtless be an unhappy influence on the manners of our people produced by the existence of slavery among us. . . . The man must be a prodigy who can retain his manners and morals undepraved by such circumstances.[14]

Booker T. Washington would also express the conviction that slavery had harmed the enslaver as much as the enslaved ("No race can wrong another race simply because it has the power to do so without being permanently injured in morals"[15]), but in

---

[14]The Portable Thomas Jefferson, ed. Merrill D. Peterson (NY: Penguin, 1983), 214.

[15]"Democracy and Education," in African-American Social & Political Thought: 1850-1920, ed. Howard Brotz (New Brunswick: Transaction Publishers, 1992), 370.

Washington's mouth such statements carry a somewhat different rhetorical charge. Whereas both Jefferson and Montesquieu speak of the effects of slaveholding on "us" as one of "us" (i.e. as a Virginian or European), Washington speaks from the other side. In discussing the effects of slaveholding on "them," Washington elevates his own people. He both ascribes superior virtue to his own people and calls forth that superior virtue through the example of his own magnanimous solicitude for degraded bigots.

Following upon his universal condemnation of slavery, Montesquieu immediately resuscitates his tripartite regime analysis. Slavery must be judged not only in itself but in the context of the regime. Under despotism, where there is little difference between slave and subject, slavery is not as intolerable. Civil slavery is just an additament to political slavery. Montesquieu is not saying that slavery should be accepted under despotism, only that its sufferers themselves will feel it less. When one has already been injured, an added insult often goes virtually unnoticed. In a democracy, by contrast, slavery is "contrary to the spirit of the constitution." Institutionalized inequality can have no proper place in a regime which aims at maintaining equality and frugality. (It is important to keep in mind that "democracy" refers to the austere classical republic. In many respects a modern, commercial, representative republic like our own is closer to Montesquieu's "monarchy" than his "democracy.") Most interesting is what Montesquieu says about monarchy: "But in monarchical government, where it is sovereignly important neither to beat down nor to debase human nature, there must be no slaves." In other words, slavery is forbidden not because the regime mandates equality of condition, but because the regime depends on the full flourishing of human nature, and in particular, on the spirit of human highheartedness. Remember that a monarch governs by fundamental laws rather than by his will alone, which is to say that monarchy depends on the existence of intermediate powers (as for instance, the nobility, the clergy, the municipalities, the guilds, etc.),

with prerogatives and rights of their own (II.4). Moreover, these corporate powers are not really intermediate if the body of the people is not free. Honor, or "the prejudice of each person and each condition" (III.6) is the soul of monarchy: "Honor makes all the parts of the body politic move; its very action binds them, and each person works for the common good, believing he works for his individual interests." In a monarchy, humanité becomes a political necessity--it is "sovereignly important" not to dishonor individuals or classes, since sovereignty in such a regime is constituted by the multiplicity of interests and the separation of powers.

Just in passing, one curious fact about this first chapter should be noted: it contains no mention of climate. In fact, there will be no such mention until chapters 7 and 8, the only two of book XV's nineteen chapters to address the avowed topic.

There follow four chapters which explode the various rationales for slavery. These chapters on the specious "right of slavery" present an interesting progression. Montesquieu begins with a critique of the Roman jurists who sought to present slavery as the law's merciful alternative to a worse fate. The Romans argued that:

> The right of nations wanted prisoners to become slaves so that they would not be killed. The civil right of the Romans permitted debtors whose creditors might have mistreated them to sell themselves; and natural right wanted the children of an enslaved father who was no longer able to feed them to be enslaved like their father. (XV.2)

Montesquieu replies point by point. As to the right of nations, since it does not permit the murder of captives, so it does not authorize enslavement to avert murder. As to civil right, it does not allow a free man to sell himself; to contract into slavery is logically impossible. Moreover, "[t]he liberty of each citizen is a part of the public liberty" (XV.2) and hence non-fungible. As to the argument from natural right, Montesquieu says that what cannot be done to the father through the right of nations or civil right cannot be done to his children by virtue of their

nativity. In sum, "[t]hese reasons of the jurists are not sensible" and "[o]ne would never believe that pity established slavery" (XV.2).

Montesquieu's refutation of the Roman jurists exposes the unlawfulness of slavery: "the law of slavery has never been useful to [the slave]; it is against him in every case, without ever being for him, which is contrary to the fundamental principle of all societies." The right which the Roman jurists speak of is nothing but the right of the stronger. In chapters 3 and 4, both entitled "Another origin of the right of slavery," Montesquieu turns his attention to the modern practitioners of slavery, the European imperialists, among whom the essential character of slavery is more forthright. In chapter 3, he attacks the Spaniards and their conviction of cultural superiority:

> Lopez de Gomara says that "the Spanish found, close to Sainte-Marie, baskets in which the inhabitants had put produce; there were crabs, snails, crickets, and grasshoppers. The victors treated this as a crime in the vanquished." The author claims that the right that made the Americans slaves of the Spanish was founded on this, not to mention the fact that they smoked tobacco and that they did not cut their beards in the Spanish fashion.

As always, Spanish bullishness is treated with picador-like satire by Montesquieu. The lance bites deeper in chapter 4 where Montesquieu denounces the religious fanaticism that would embrace slavery as an instrument in the spread of Christianity:

> It was this way of thinking that encouraged the destroyers of America in their crimes. On this idea they founded the right of making so many peoples slaves; for these brigands, who absolutely wanted to be both brigands and Christians, were very devout.

Montesquieu is a most determined foe of imperialism. This appears most forcefully whenever he discusses the events following upon the discovery of the New World. The Spanish are repeatedly castigated for their plundering and pillaging, as well as their proselytizing. Between them, the conquistadors and Jesuits have despoiled South America. Montesquieu does what he can to insure

that this is not the model of Western involvement with the world. As one of the great theorists of commerce, Montesquieu is clearly not opposed to the idea of contact between peoples; he does however want the engagement to be conducted upon certain principles and directed toward certain ends. He is, moreover, aware of the inevitable costs of communication. Disease, for instance, is highly communicable. The chapter "On the laws relating to diseases from the climate" (XIV.11) traces the spread of disease via the route of empire ("The Crusades brought us leprosy"). Transmission often travels both directions: while the Indians perished of small pox, the Spanish were decimated by syphilis. Montesquieu suggests that these natural consequences of social contact can be checked, although not entirely averted, through the use of quarantines and other public health measures.

Slavery also is a frequent consequence--albeit an entirely man-made one--of contact among peoples. Montesquieu concludes this short series of chapters with a discussion of the European institution of African slavery in the Americas. Entitled "On the Slavery of Negroes" (XV.5), this chapter presents all the standard justifications--economic, cultural, and religious--for race slavery. Montesquieu speaks ostensibly in his own name, saying: "If I had to defend the right we had of making Negroes slaves, here is what I would say." The conditional form of the opening sentence, however, serves to alert the reader to expect some ironic distance between Montesquieu's own views and the "arguments" offered. Rather than sermonize on the injustice of race slavery, Montesquieu simply mouths the self-incriminating arguments of its proponents. Stripped of all euphemism, these justifications appear for what they are: brutal, prideful, and absurd.

Montesquieu begins with the economic justifications:

> The peoples of Europe, having exterminated those of America, had to make slaves of those of Africa in order to use them to clear so much land.
>
> Sugar would be too expensive if the plant producing it were not cultivated by slaves.

As W.E.B. DuBois informed his white fellow citizens, the Negro brought with him "the gift of sweat and brawn to beat back the wilderness, conquer the soil, and lay the foundations of this vast economic empire two hundred years earlier than your weak hands could have done it."[16] Montesquieu suggests it was not an incapacity for hard labor on the part of the Europeans so much as an indisposition to it born of arrogance and compounded by greed.

With African slavery established, racial justifications come to the fore:

> Those concerned are black from head to toe, and they have such flat noses that it is almost impossible to feel sorry for them.
>
> One cannot get into one's mind that god, who is a very wise being, should have put a soul, above all a good soul, in a body that was entirely black.
>
> It is so natural to think that color constitutes the essence of humanity that the peoples of Asia, who make eunuchs, continue to deprive blacks of their likeness to us in this more distinctive way.

In this string of excuses for slavery, which might at first seem random, Montesquieu traces the progression of race prejudice from an initial perception of physical difference which impairs fellow feeling to an assumption of spiritual and moral difference, and finally to an act, castration, that truly establishes physical (and possibly moral) difference. Concluding that blacks are not men, the peoples of the East have tried to eradicate any attributes that indicate otherwise. Where nature has failed to render supposedly natural differences sufficiently clear, resort has been had to human correction. Color consciousness may extend even further, culminating in genocide. Curiously, the example Montesquieu gives refers not to black victims, but white:

> One can judge the color of the skin by the color of the hair, which, among the Egyptians, who are the best philosophers in the world, was of such great consequence that they had all the red-haired men who fell into their hands put to death.

---

[16]W.E.B. DuBois, The Souls of Black Folk (Fawcett Publications, 1961), 190.

By reversing the discrimination, Montesquieu shows that racism is not unidirectional; since it is a matter of perspective, the ascription of inferiority may strike any group. In the Persian Letters, one of the characters offers an explanation of this phenomenon:

> It seems to me, Usbek, that we judge things only by a covert reference that we make to ourselves. I am not surprised that Negroes paint the devil in dazzling white and their gods in carbon black; or that the Venus of certain peoples has breasts that hang to her thighs; . . . It is well said that if triangles were to create a god, they would describe him with three sides. (#59)

Natural aesthetic self-preference leads men of one race to demonize men of other races, in effect, reading them out of humanity, while at the same time, projecting themselves into the heavens. Men deny similarity where it exists (namely, among human beings) and ascribe similarity where there is none (that is, between men and the divine). Just as despotism is a form of politics reduced to elemental passions, the despotic aesthetic is concerned with surfaces, the simple (though perhaps deceptive) appearance of things.

Montesquieu enlarges on this theme of appearance, producing a mock justification for slavery which unites racial and economic factors:

> A proof that Negroes do not have common sense is that they make more of a glass necklace than of one of gold, which is of such great consequence among nations having a police.

Necklaces of glass and gold are both intrinsically worthless baubles. The value Europeans set upon gold is entirely conventional, a product of human agreement upon a common measure. The blacks are no more foolish than the whites, although the Africans' ignorance of Western currency valuations may make slavery more profitable than it would otherwise be.[17]

---

[17]Elsewhere in The Spirit of the Laws, Montesquieu makes clear the folly involved in the Spanish quest for gold:

Montesquieu concludes this chapter with a supremely ironic formulation of religious reasonings:

> It is impossible for us to assume that these people are men because if we assumed they were men one would begin to believe that we ourselves were not Christians.
>
> Petty spirits exaggerate too much the injustice done the Africans. For, if it were as they say, would it not have occurred to the princes of Europe, who make so many useless agreements with one another, to make a general one in favor of mercy and pity?

Slavery is at odds with the Christian teaching of universal human brotherhood. One response to that contradiction between principle and practice is to ruthlessly resolve it by denying the slave's humanity. Montesquieu's remarks point up the contrast between ancient and modern attitudes toward slavery. The ancients at least included the slave within the family of man, and sought to justify slavery, however erroneously or hypocritically, on charitable grounds. The modern defenders of slavery are driven to deny a common creation. The force of the contradiction between principle and practice (between universal declarations and the peculiar institution) is part of the reason for the greater viciousness of modern chattel slavery, but also what made possible its eventual abolition. The American struggle over the slavery question, in all its glory and all its sordidness, would

---

> [Spain] drew from the newly discovered world so prodigious a quantity of gold and silver that there was no possible comparison with what there had previously been. . . .
>
> After this time, the Spanish monarchy went into an uninterrupted decline. This was because there was an internal and physical vice in the nature of this wealth, which made it hollow, and this vice increased daily.
>
> Gold and silver are a wealth of fiction or of sign. These signs are very durable and almost indestructible by their nature. The more they increase, the more they lose of their worth, because they represent fewer things.
>
> When they conquered Mexico and Peru, the Spanish abandoned natural wealth in order to have a wealth of sign, which gradually became debased. . . .
>
> I have more than once heard deplored the blindness of the Council of Francis I for refusing Christopher Columbus' proposal to go to the Indies. In truth one did, perhaps imprudently, a very wise thing. Spain acted like the foolish king who asked that everything he touched turn into gold and who was obliged to go back to the gods and beg that they put an end to his destitution. (XXI.22)

be unimaginable in the ancient world. Montesquieu's exploration of the rationales for slavery began in chapter 2 with the mention of pity and ends in chapter 5 with another mention of pity, but in that short space we have moved from pity establishing slavery to pity favoring emancipation.

Having excoriated both Roman and European-instituted slavery, Montesquieu seeks in chapter 6 "the true origin of the right of slavery." The true origin turns out to be political in nature, which is to say derivative from the regime. Civil slavery cannot be justified on the grounds of culture, religion, economics, or race. It can only be justified politically in the sense that slavery is natural to one particular form of regime: "In every despotic government, it is very easy to sell oneself; there political slavery more or less annihilates civil liberty" (XV.6). Despite his reknown as a sociological pioneer, Montesquieu still regards the political as primary and determinative. While the free citizen of a republic or monarchy cannot sell himself, the subject of a despot apparently can. He is his own commodity. Perhaps surprisingly, Montesquieu calls this form of slavery "gentle." He speaks for instance of merchants being the slaves of lords, and those merchants having slaves of their own. It is as if all men require a place in the despotic hierarchy. Subordination is a condition of existence, but one has some choice of master and, moreover, the intermediate master is not absolute. Montesquieu seems to be describing an entire nation built on the model of an immense bureaucracy, where power flows from the top down and there are no independent sources of power.

In the succeeding chapter, "Another origin of the right of slavery," the climate finally makes itself felt. We learn that in excessively hot countries, slavery, even "cruel" slavery, "offends reason less" (XV.7). Since no one willingly works in hot climes, it may be that recourse must be had to fear and force. Once again, Montesquieu stresses the connection between civil and political slavery: in such places, the masters themselves are

slaves to the prince. At this point, Montesquieu indicates that he doesn't think much of Aristotle's argument for natural slavery. He doesn't go into details, but earlier he had rejected the idea that "those persons incapable of earning their living must be reduced to servitude" on the very pragmatic ground that "one does not want such slaves as these" (XV.2). If natural slavery hinges on a lack of reason and self-sufficiency, as Aristotle initially argues, then slaves would be burdensome to masters. The really useful slave, as Aristotle himself admits when speaking of Oriental eunuchs, is an intelligent being lacking in courage and will. It is just such a being that Montesquieu considers calling a "slave by nature": "I believe that, if there are any such, they are those whom I have just mentioned." Montesquieu, however, pulls back from endorsing the phrase "slave by nature," preferring to assert that "as all men are born equal, one must say that slavery is against nature, although in certain countries it may be founded on a natural reason." We see again the doubleness or ambiguity of nature; physical nature fails to support or vindicate human nature.

While chapter 7 does contain a concession to the force of the climate, Montesquieu manages to turn even this concession to the service of the anti-slavery cause. The next chapter is entitled "Uselessness of slavery among ourselves." The effect of Montesquieu's concession to what he now calls "natural servitude"[18] is not to condone slavery, but rather to quarantine it, to place it beyond the pale of civilization. Montesquieu says,

> natural servitude must be limited to certain particular countries of the world. In all the others, it seems to me that everything can be done by freemen, however arduous the work that society requires.

The exception not only proves the rule, but serves to enforce the

---

[18]I believe that "natural servitude" is meant to connote that the existence of slavery is natural under certain circumstances, but not that those who find themselves in that condition are "slaves by nature." The phrase has a general rather than an individual bearing.

rule. Montesquieu pursues a complex rhetorical strategy in these chapters. By associating "natural servitude" with some poor unfortunate lands, Montesquieu appeals to a kind of snobbishness or ethnocentrism in his readers. Note however that Montesquieu does not name any of the ill-fated lands; he capitalizes on the inclination of each nation to count itself among the fortunate. He goes on, through the example of mine work in Europe, to give instruction in how free labor can replace slave labor. Finally, he holds out the possibility that proper laws and institutions, together with the liberating potential of technology, could overcome the despotic tendency of even the worst climates:

> There is no work so arduous that one cannot adjust it to the strength of the one who does it, provided that reason and not avarice regulates it. With the convenience of machines invented or applied by art, one can replace the forced labor that elsewhere is done by slaves. The mines of the Turks, in the Province of Timisuara, were richer than those in Hungary, but they did not produce as much because the imagination of the Turks never went beyond the brawn of their slaves.
>
> I do not know if my spirit or my heart dictates this point. Perhaps there is no climate on earth where one could not engage freemen to work. Because the laws were badly made, lazy men appeared; because these men were lazy, they were enslaved.

Ever cautious, Montesquieu hints he may be overly optimistic; it may be his heart which speaks. Nonetheless, his inability in this case to distinguish between head and heart is itself grounds for reasonable hope. In the end, moral factors outweigh physical factors. The art of legislation can counteract the force of the climate. If the air is bad, we need more than air-conditioning; we need a kind of soul-conditioning.

While chapter 8 deals with the construction of civil liberty, chapter 9, "On nations among whom civil liberty is generally established," deals with its perpetuation. Apparently, the prevalence of civil liberty is no guarantee of its continuance. Montesquieu reveals that the impulse to slavery exists not only in particular regimes and particular climates, but in the passions of individuals: "Every day one hears it said

that it would be good if there were slaves among us." To meet this challenge, Montesquieu employs a rhetoric we have not heard from him yet. Earlier, Montesquieu used ridicule and parody to expose brutality and hypocrisy and to impugn the pro-slavery position (chapters 2-5); then he shifted to an appeal to national pride and self-opinion in order to begin to build up anti-slavery sentiment (chapters 6-8); now he solidifies that sentiment by giving it a moral foundation (chapter 9). We have finally become fitted for more high-minded appeals:

> the cry for slavery is the cry of luxury and voluptuousness, and not that of the love of public felicity. Who can doubt that each man, individually, would not be quite content to be the master of the goods, the honor, and the life of others and that all his passions would not be awakened at once at this idea? Do you want to know whether the desires of each are legitimate in these things? Examine the desires of all.

Pleasure, including the pleasure of the majority, is not a sufficient guide to the common good. Civil liberty ultimately rests on a restriction of self in deference to the equal dignity of others. I believe that Montesquieu's achievement in these chapters deserves the appellation "Lincolnian." His moral education of the reader is an example of philosophic statesmanship. As our own national experience indicates, the preservation of civil liberty does indeed depend on such education.

IV

Book XV can be divided into two main parts. Chapters 1-10 are foundational; they answer the who, what, why and where questions. What is slavery? What are its kinds? Is anyone legitimately enslaved? Why and where is slavery established? Can it be abolished? Chapters 11-19 are more directly practical, not "what is?" but "what is to be done?" The title of chapter 11 gives the general topic: "What the laws ought to do in relation to slavery" and the chapter itself consists of a one-sentence

answer: "But whatever the nature of slavery, civil laws must seek to remove, on the one hand, its abuses, and on the other, its dangers." Like Aristotle, Montesquieu is willing to give advice to despots, not because he is a friend to despotism, but because if adopted his advice would ameliorate despotism and prepare the transition to moderate government. There are two basic strategies for dealing with an existing evil like slavery. The first is to declare its lawlessness and insist on immediate and complete abolition, rejecting any attempts to lessen the horrors of slavery as tending to condone and perpetuate the essential wrong. So long as it exists, the relation of master and slave is illimitable. This, for instance, was the line taken by William Lloyd Garrison and the American Anti-Slavery Society. While Montesquieu surely does what he can to encourage anti-slavery sentiment, he is no radical utopian abolitionist. He pursues the reformer's path of bringing slavery within the purlieus of the law. As the misbegotten creature of positive law, slavery ought to be owned and regulated by that law.

Chapter 11 had spoken of removing "abuses," but chapter 12 shifts to the singular. By "the abuse of slavery," Montesquieu means the sexual enslavement of women, whether in the organized form of the polygamous harem or in the more disorderly form of incontinent masters. Involuntary sex is more of a violation than involuntary labor; even when one's labor is at the disposal of another, one's privates ought not be. To borrow the words of an ante-bellum Southern court "because individuals may have been deprived of many of their rights by society, it does not follow that they have been deprived of all their rights."[19] We can see Montesquieu taking the first steps to mark off a zone of personal integrity, creating what we might call "a right of privacy." In addition to violating the laws of modesty, which are part of

---

[19]State v. Jones 1 Miss 83 (1820) quoted in Herbert J. Storing, "Slavery and the Moral Foundations of the American Republic," in The Moral Foundations of the American Republic, third edition, edited by Robert H. Horwitz (Charlottesville, University Press of Virginia, 1986), 316.

natural right, sexual slavery works a further corruption. In the harem, women receive leisure in compensation for their claustration. Idle and vain, these enemies of work come to love their subjection. Although Montesquieu had spoken of the need for the civil law to remove abuses, he suggests no means by which the civil law might remedy this situation. One can only surmise that there are situations which are beyond statutory correction, or which require a prior revolution in a nation's manner of thinking. As Montesquieu's other discussions of polygamy make clear, a theological/sexual revolution is called for. The problem of incontinent masters, on the other hand, is more readily addressable by the civil law, in part because such behavior lacks any religious justification. Montesquieu endorses the following law of the Lombards: "'If a master debauches the wife of his slave, both of them will be free.'" Furthermore, he recommends that the right of marriage be secured to slaves, both for themselves and in order to safeguard the marriages of citizens. (A story like William Faulkner's "Was" illustrates well the moral effects that the South's brutal and shameful miscegenation had upon the institution of the family.) The weight Montesquieu accords to the sexual and familial aspect is a very distinctive feature of his political philosophy. Although he only touches upon it here, the next book (XVI) is devoted entirely to the subject of domestic despotism and, of course, the theme is central to the Persian Letters as well.

While the abuses of slavery afflict the distaff side in particular, the dangers of slavery, as outlined in chapter 13, derive from the spear side. A wise legislator must see to it that female slaves are not put upon, and that there is no occasion on which male slaves must be put down. Perhaps paradoxically, slave insurrections are especially to be feared in moderate governments. In despotic countries, where virtually all are reduced to slavery of one form or another, rebellion is unlikely. Great numbers of slaves are no hindrance to despotic order. But the situation is otherwise in moderate states. There "it is very

important not to have too many slaves" (XV.13) since the sight of other men in full enjoyment of liberty awakens spiritedness. Slaves who have become aware of their own debasement are "the natural enemies of society" (XV.13). A moderate government in which slavery exists is a nation at war with itself. As Montesquieu illustrates in chapters 14 and 15, a warrior people may be able to contain that discord or even use it to fuel their martial spirit. In chapter 16, however, Montesquieu offers an alternative to institutionalized civil war:

> The Athenians treated their slaves with great gentleness; one sees that the slaves did not disturb the state in Athens, whereas they shook it in Lacedaemonia. . . . A prudent legislator avoids the misfortune of becoming a terrifying legislator. Because the slaves among the Romans could have no trust in the law, the law could have no trust in them.

A regime's security can be based as much on confidence as on coercion. In chapter 17, "Regulations to make between the master and the slaves," and chapter 18, "On freeing slaves," Montesquieu sketches the fundamental provisions of a conciliatory slave code. The amor patriae of the slaves need not be destroyed, if a modicum of justice is extended to them. The general rule is to secure life if not liberty. In practice, this means that the law must prescribe something like minimum care standards with respect to food, clothing, sickness, and old age. Further, if masters possess the power of life and death, such punishment as they mete out must take place under color of the law at least. Montesquieu says that "the law must order formalities, which remove the suspicion of a violent action" (XV.17). Moreover, slaves should have available to them some legal recourse against an abusive master, as for instance, a right to request transfer to another master.

Through such provisions of the civil law, Montesquieu in effect strips the slaveholder of his absolute, arbitrary authority. Yet interestingly, Montesquieu continues to call the other party "slaves," despite the fact that they no longer meet

the strict definition. While Montesquieu works to ameliorate the terms of slavery, he does not let the term "slavery" itself suffer any euphemistic modification. In fact, what he does is to extend the reach of the word, and thereby muster the animus triggered by the word "slavery" against ever less frightful conditions. This method of gradual reform is truly progressive--one imagines Montesquieu eventually being able to employ anti-slavery sentiment in the service of labor reform. Montesquieu's departure from his philosophic forebears is especially marked in these two chapters. Whereas Montesquieu uses "slavery" in a capacious sense, Hobbes and Locke both contract its meaning. For Hobbes, a slave is a man in irons, physically vanquished but unrelenting in his hostility to his captor. All others are servants who have consented to their subjection in the interest of self-preservation.[20] On Hobbes' reading, individuals captured in Africa and shipped to America were slaves, but those same Africans once they had been sold to plantation owners were servants. In contrast to Hobbes, Montesquieu does not dress subjection up as consent. While one can find in Locke, unlike Hobbes, a strong denunciation of despotism and a spur to vindicate the right of liberty, Locke nonetheless blunts the anti-slavery effect of his words with his exceedingly narrow definition of slavery (and correspondingly broad definition of consent). Locke also asserts that once obedience enters, slavery ceases. Thus, of the practice of selling oneself into slavery among the Jews, Locke says "this was only to Drudgery, not to Slavery."[21] Montesquieu discusses the same passage from Exodus (chapter 21), praising the Jews for placing a time limit on slavery, but strongly faulting them for other provisions of their slave code:

> The law of Moses was very crude. "If someone beats his

---

[20]Hobbes, Leviathan, p. 153-4.

[21]John Locke, Two Treatises of Government, edited by Peter Laslett (NY: Cambridge University Press, 1960), 326.

> slave and the slave dies under his hand, he will be punished; but if the slave survives a day or two, he will not be punished because it is his silver." What a people, whose civil law ceased to cling to natural law! (XV.17)

At a minimum, those deprived of "natural defense" must be provided with "civil defense."

Montesquieu is unwilling to treat slavery as a purely domestic institution, exempt from civil interference. Since the existence of slavery is a threat to the continuance of moderate government, the regime has leave to defend itself against the cancer. In explaining why the slavery question was of national, and not merely local, concern, Abraham Lincoln employed similar reasoning:

> Finally, I insist, that if there is ANY THING which it is the duty of the WHOLE PEOPLE to never entrust to any hands but their own, that thing is the preservation and perpetuity, of their own liberties, and institutions. And if they shall think, as I do, that the extension of slavery endangers them, more than any, or all other causes, how recreant to themselves, if they submit the question, and with it, the fate of their country, to a mere hand-full of men, bent only on temporary self-interest. If this question of slavery extension were an insignificant one--one having no power to do harm--it might be shuffled aside in this way. But being, as it is, the great Behemoth of danger, shall the strong gripe of the nation be loosened upon him, to entrust him to the hands of such feeble keepers?[22]

John Quincy Adams had likewise argued for national intervention, claiming that in the event of actual rebellion, national power would extend beyond the matter of slavery's extension to its very existence. On the floor of the House on April 14, 1842, Adams explained how and with what authorization the federal power might one day put an end to slavery:

> I might furnish a thousand proofs to show that the pretensions of gentlemen to the sanctity of their municipal institutions under a state of actual invasion and of actual war, whether servile, civil, or foreign, is wholly unfounded, and that the laws of war do, in all such cases,

---

[22]"Speech on the Kansas-Nebraska Act, 1854," in The Political Thought of Abraham Lincoln, edited by Richard N. Current (NY: Macmillan, 1967), 78.

> take the precedence. I lay this down as the law of nations. I say that the military authority takes for the time the place of all municipal institutions, and slavery among the rest; and that, under that state of things, so far from its being true that the States where slavery exists have the exclusive management of the subject, not only the President of the United States but the commander of the army has power to order the universal emancipation of the slaves.

As Adams had predicted, the pen-stroke of emancipation followed the sword-stroke of civil war. Montesquieu's thrust is also toward emancipation (hence the penultimate chapter of this book "On freeing slaves"), but at the same time, he recognizes the difficulties involved: "the republic can be equally endangered by too many freed men and by too many slaves" (XV.18). In Jefferson's pithy formulation, "we have the wolf by the ears, and we can neither hold him, nor safely let him go."[23] Aware that circumstances must dictate the pace and perhaps even the possibility of emancipation, Montesquieu is exceedingly reluctant to speak in general terms, but it is clear that he favors voluntary over forced emancipation, gradual over sudden emancipation, and compensated over uncompensated emancipation. In other words, he would want to avoid the necessity for an executive order like the Emancipation Proclamation.[24] He is quite emphatic on this point:

> Slaves must not be freed suddenly in considerable numbers by a general law. One knows that, among the Volscians, when the freed men became masters of the voting, they made an abominable law giving themselves the right to be the first to lie with girls who married freeborn men.

Former slaves, precisely because of their experience of slavery

---

[23]Letter from Thomas Jefferson to John Holmes, April 22, 1820, in The Portable Thomas Jefferson, edited by Merrill D. Peterson (NY: Penguin, 1983), 568.

[24]Lincoln himself was loathe to issue it, waiting through 17 months of war. Even in the three month interim between the preliminary announcement of the Proclamation and the date of its taking effect, Lincoln urged the adoption of a Constitutional Amendment which would provide for voluntary, gradual, compensated emancipation, believing that that route "spares both races from the evils of sudden derangement." ("Second Annual Message to Congress, 1862," in The Political Thought of Abraham Lincoln, 220-34.)

and slaveholders, may regard the law only as an instrument of one's own pleasure. To avoid the prospect of the exploited becoming the exploiters, freedmen must be incorporated into the body politic slowly. Whereas the rapid rise of a sizeable group of freedmen to full political equality could lead to factionalism, gradual emancipation will remove the opportunity for revenge and allow the freedmen a chance to become true fellow citizens. For Montesquieu, extremism, even in the defense of liberty, is a vice (and the corollary: moderation, even in the pursuit of justice, is a virtue). Extremists always come in see-sawing pairs; thus, the radical Reconstruction governments in the South are succeeded by the reactionary Redeemer governments, with the result that the cause of civil rights was delayed for nearly a hundred years. Montesquieu acknowledges the relevance of the distinction between the freedmen and the freeborn, but argues for a gradual, generational removal of exclusions, with the children of freedmen being freeborn.

Montesquieu recommends various methods by which new citizens might be assimilated. In each case the aim is to offer a chance to exchange the forged bonds of the slave for the paper bonds of the wage-slave. For instance, "[t]he laws can favor savings and put the slaves in a position to buy their liberty"; or "[t]hey can set the term of servitude"--in other words, an indentured, contract-based arrangement; or "[o]ne can even heal the ill at its root; as a great number of slaves are bound to the various employments given them, transferring to the freeborn a part of these employments, for example, commerce or navigation, decreases the number of slaves." A variation on this latter strategy was attempted by Jefferson. In the chapter on commerce in his Notes on the State of Virginia, Jefferson encourages Virginians to abandon the growing of tobacco, their primary crop, and switch to wheat farming. At the end of the same chapter, Jefferson recommends horse-breeding to Virginians. As is well known, tobacco farming is labor-intensive; Jefferson calls it "a culture productive of infinite wretchedness. Those employed in it are in

a continued state of exertion beyond the powers of nature to support." By contrast, wheat farming is ideally suited to horse-powered mechanization. I believe Jefferson hoped that together these two innovations might make slave labor unnecessary and inefficient. A slavery eradication program should go after the economic roots of slavery, as well as the moral climate in which slavery thrives. Commerce is one of the human arts whereby men can transform the determinism and despotism of nature. Commerce is the art which remedies "both the defect of nature and the defects of art itself" (XXI.6).

The final chapter, "On freed men and eunuchs," is an odd one. We learn that under majoritarian rule, the freeborn may have a somewhat higher status than the recently freed; nonetheless, substantial equality is the goal. Under arbitrary one-man rule, the situation is reversed; the recently elevated actually have the advantage, since their elevation is owing to the personal favor of the despot. Freedom becomes a gift, rather than a right or an achievement. However, it seems that there are those who cannot occupy the office of a freed man, even when it is given: namely, eunuchs. In considering this chapter, one must not forget the well-established link between eunuchs and priests in Montesquieu's writing. Eunuchs are present in most all of his works, both those published in his lifetime and in his private journals. He had long been occupied with their meaning, and with the similarity between the eunuchs and the priesthood. Priestly eunuchs first appear in "Les Pretres dans le paganisme," a work Montesquieu wrote at the age of twenty-two (Pensées, no. 591). In the Persian Letters, the analogy between eunuchs and priests is clearly drawn in the letter on the causes of depopulation in Christian countries: Usbek complains of the "great number of eunuchs" in Christian lands, explaining that he is "referring to those priests and dervishes of both sexes who are sworn to perpetual chastity" (#117). In mentioning the vow of silence taken by the Carthusian order, Rica makes the same point, in his own inimitable "modest proposal" fashion:

> It is said that the Carthusians cut off their tongues upon entering the convent, and it would be most desirable if all the other dervishes would remove in the same way everything rendered useless by their profession.

According to Montesquieu, the eunuchism encouraged by Christianity was made explicit by Origen, one of the early Church fathers, who "castrated himself on account of a verse" (Pensées, no. 2162a, the verse he acted upon was Matthew 19:12). With the standard path of manliness blocked, another is formulated. A malicious, subterranean hatred circulates through, and eventually dominates, the eunuch's being. Sexual passion is not so much expunged as displaced or channeled into the quest for power. In almost Nietzschean manner, Montesquieu links priestly asceticism and the quest for temporal dominion. Book XV ends on a gloomy note, with a comparison of the eunuchs to Lucifer himself. As Lucifer is a fallen angel, the eunuch is a fallen man, given up to "the enterprises of despair." Despite their unnatural degradation below the human rank, eunuchs routinely exercise administrative rule in despotic lands. Nonetheless, "despite the privileges accorded them," Montesquieu says,

> they can scarcely be regarded as freed men. For, as they cannot have families, they are bound to a family by their nature, and it is only by a kind of fiction that one can regard them as citizens.

Montesquieu strongly implies that citizenship rests on the sub-political foundation of the family--and not the family of one's birth, but the family of one's making. Because of the eunuchs' sexual disability, their office is that of mediation rather than initiation. They are hangers-on, ideally suited to be the animate instruments of another's wealth or glory: "They have no family, and although they are naturally avaricious, the master or prince profits in the end from their very avarice" (XV.19). Theirs is the rule of ressentiment--ambitious, but ultimately slavish, for eunuchs cannot aspire to rule in their own name. They are the vehicle of the husband's or the lord's apotheosis and, at the same time, the vehicle of the wives' or the people's subjection.

Montesquieu explicitly connects the prevalence and preeminence of eunuchs with scorn for women. Religious and sexual despotism are linked. The religious assault on the sexual component of the self is rooted in misogyny. Thus, this final chapter serves as the transition to Book XVI on domestic despotism. If, as the final sentence declares, "[i]t seems that eunuchs are a necessary ill in the East" (XV.19), we shall know why from the next book. The discussion of slavery must turn to the question of sexual difference.

V

Unlike the ancients, whose search for the best regime was guided by a view of man's natural end; and equally unlike those moderns, namely Hobbes and Locke, whose elaboration of a universally valid public law was guided by a view of man's natural beginnings, Montesquieu takes as his starting point the most prevalent political situation: despotic government. He begins where we begin, in medias res, amidst human history and human convention. Perhaps no other thinker has so documented the ways in which men are unfree: under the power of climate and geography, of passion and prejudice, of custom and law. Montesquieu's sociological inquiry, however, is not undertaken with a view to establishing determinism. Rather, he seeks room for maneuver within the conditions of life; he seeks to increase the potential for politics. In the Pensées, Montesquieu offers this startling summation of the difference between despotic and non-despotic government: "For me, good laws are like great nets in which fish are caught but believe themselves free, and bad laws are like nets in which the fish are so constrained that they sense immediately they've been caught" (no. 1798). For Montesquieu, liberty is in a very real sense a state of mind, an opinion of one's security--an opinion fostered by mild laws and unobtrusive institutions. More than any other thinker, Montesquieu is guided by a negative standard. Liberty itself is

understood not as the opposite of despotism (that is, as the absence of constraint), but rather as a relaxation of it. The constraints of liberty should be invisible.

Particularly at this juncture, as the nations of Eastern Europe and the former Soviet Union secure their release from slavery and attempt a liberal reordering of their polities, Montesquieu ought to be our resource, for he offers an understanding of liberty responsive to circumstances, history, and national differences (while avoiding the Scylla and Charybdis of relativism and historicism). Because of the weight that Montesquieu assigns to the general spirit of a nation, there can be no standard blueprint for moderate government. The advent of a liberal order will not look the same in all countries. Instead of dictating rules, Montesquieu teaches us how to fathom for ourselves. He teaches the art of legislation and statesmanship rather than the science of public administration. To speak meaningfully about political things, you must look to the particulars. Political life is marked by variety, due to the variety of circumstances, and that fact affects political theory decisively. In his moderation and his comprehensiveness, in his attention to the regime question and his appreciation of prudence, Montesquieu is reminiscent of Aristotle. Although he frequently criticizes Aristotle, I believe his spirit is closest to Aristotle's:

> I say it, and it seems to me that I have written this work only to prove it: the spirit of moderation should be that of the legislator; the political good, like the moral good, is always found between two limits. (XXIX.1)

While for the freedmen of the East (and for those still enslaved there), Montesquieu may provide the best equipment for the arduous journey toward moderate, constitutional government, for the West, and Americans in particular, Montesquieu is equally indispensable. In teaching us whether and how despotism can be overcome, he provides the underpinnings of a sound American human rights policy. Here at home, our own legacy of slavery is still much with us. As I have tried to suggest by quoting from American

statesmen, black and white, who grappled with slavery, Montesquieu offers us a lens through which to understand the American experience, from Columbus to the present. A Montesquieuan education helps us to assess what was done wrong, what was done right, and what is yet to be done.

From Woman Citizenship to Separate Spheres: The Changing Identities of Abigail Smith Adams (1744-1818)

Abstract

In this paper I treat Abigail Adams as a political thinker on two axes: republicanism and gender theory. I argue that as a revolutionary republican, Abigail Adams put forth a critique of the modern state which we would today call "feminist," but dropped it and assimilated to the ideologies of separate spheres and Federalism, as John ascended as an elite politician. I explain Abigail's changing political identities as strategies to combat modern patriarchy and the denial of woman citizenship. I argue that her abandonment of feminist principles resulted in an obsession with her husband's political career, and a concomitant identification with modern republicanism and the conservative Federalist party. I conclude by suggesting that Adams's abandonment of "feminism" and the struggle for woman citizenship was made palatable by the individual political privileges that she would enjoy as a Federalist wife of the Vice President, and then as First Lady.

From Woman Citizenship to Separate Spheres:
The Changing Identities of Abigail Smith Adams (1744-1818)

Introduction

Of the many recent biographies on Abigail Smith Adams, most do not analyze Adams as an exponent of gender and republican theory, and none appear to analyze how her definition of "woman" fit into her changing conceptions of the common good.[1] Charles Akers's wonderfully concise biography comes closest to a theoretical treatment of Adams's total political thought, although it fails to note and account for her shift from neo-classical to modern republican concepts, a subject that has been the focus of debates on male political thought of the period since the 1950s.[2]

Greater attention has generally been given to Adams's thought on the status of women. While most scholars have interpreted Adam's famous "Remember the Ladies letter," narrowly as a plea for state protection against wife abuse, only Butterfield, Friedlaender, and Kline, in their edited volume of Adams family correspondence, interpret the letter broadly, as a plea for "equal rights." Yet even they deny the possibility of Abigail Adams's disappointment when John refused to work toward such legal reforms, on the grounds that Mrs. Adams's usually agreed independently with her husband on most political matters.

In this chapter I address the question of Abigail Adams's republicanism and gender theory. On one hand, I define her changing conceptions of virtue and the common good, to place her as a political intellectual within the purview of contemporary discussions of American political thought and development. On the other hand, I define her multiple conceptions of womanhood, to address the question of whether and how she could be considered what we would today call a "feminist." I show that Abigail Adams redefined virtue and corruption conservatively in her shift from a revolutionary to a Federalist, and that this shift fostered her acceptance of separate spheres ideology, the very ideology that John used to refuse her proposal for woman citizenship. I begin the chapter situating Adams in the roles she played during the Revolution. I then define her conception of republicanism and prescriptions for the category "woman" that emerged from her revolutionary experience. I argue that Adams offered a feminist critique of the state, which was in tension with her republicanism, especially the republican definition of woman. I show how her identification with the Federalist party led her to toward a reactionary and conservative definition of republicanism, at the same time that it dissipated her feminism and led her accept the separate spheres ideology that she had originally challenged.

I. Deputy Husband

The American Revolution separated John and Abigail Adams's living quarters for a decade. From the time that John was elected to the first Continental Congress in 1774 to a year after the conclusion of peace with Great Britain in 1884, John and Abigail maintained their relationship through correspondence, interrupted by only two brief visits together. During much of this time, Abigail, like many wives, served as a single parent and "deputy

husband," assuming all of the roles that John had abandoned in pursuit of his revolutionary fame. While John Adams defined himself as a revolutionary hero in the public realm, Abigail assumed new roles as parental educator, family farmer, breadwinner, and negotiator of contracts.

A. Parental Educator and Farmeress

Initially, Deputy Adams felt incompetent and overwhelmed with her new responsibilities. She wrote her friend Mercy Warren, "I find myself. . . not only doubled in Wedlock but multiplied in cares to which I know myself unequal, in the Education of my little flock I stand in assistance of my Better half." She felt she could not "do them justice" because of "the multiplicity of other concerns" that were now hers in the absence of her "associate." And since their hired hand had become ill and left them, she felt "obliged to direct what I fear I do not properly understand." She told John as well that she scarcely knew which way to turn and felt "uneaquil to the cares which fall upon me," especially "to be the Directress of our Husbandry and farming."[3]

As Adams mastered formerly "masculine" duties, she grew confident and took pride in them. Within weeks she seemed to have mastered farming. General James Warren, Mercy's husband, was certainly impressed, and wrote John, "I don't doubt but Mrs. Adams Native Genius will Excel us all in Husbandry. She was much engaged when I came along, and the Farm at Braintree appeared to be under Excellent Management. I tried to persuade her to make a Visit to her Friend Mrs. Warren, but she cant leave Home this Busy Season."[4] Capable as she was, John's praise of her "conduct in the Management of our private affairs" made her more confident. His praise sufficiently compensated her anxieties in discharging "the many duties devolved upon me in consequence of the absence of my dearest Friend."[5]

Directress Adams seemed to flourish in her independence, learning the intricacies of agri-business on the job. But wartime farming was much more challenging than peacetime farming. The "late call of Men" would distress them in their husbandry. Abigail lost her "Negro head," who had chosen to fight for his freedom. "His going away would not worry me so much if it was not for the rapid depretitation of our money, she explained. "We can scarcely get a days work done for money and if money is paid tis at such a rate that tis almost imposible to live." Abigail curbed her own consumption, and lived now "as I never did before," but took pride that "Heaven" had "blessed us with fine crops." In the wonderful detail that distinguished her letters, she documented projected returns. "I hope to have 200 hundred Bushels of corn and a hundred & 50 weight of flax. English Hay we have more than we had last year, notwithstanding your ground wants manure. We are like to have a plenty of sause [garden sauce, i.e., from vegetables] I shall have fat Beaf and pork enough, make butter and cheesse enough." As for the imported staples she was accustomed to, she told John, in a voice of republican sacrifice, "[if I have neither Sugare, molasses, coffe nor Tea I have no right to complain. I can live without any of them and if what I enjoy I can share with my partner and with Liberty, I can sing o be joyfull and sit down content. . . . "

Like other patriotic women, Abigail Adams clothes her children and servants in

homespun. Unlike many other women, she kept her the family farm financially sound. She had "contracted no debts that I have not dischargd," and managed to pay off previous debts; "one of our Labourers Prince I have paid seven months wages to since you left me. Besides that I have paid Bracket near all we owed him which was to the amount of 15 pounds lawfull money. . . ." She also "set up a cider press . . . besides procuring and repairing many other articles in the Husbandery way, which you know are constantly wanted." As Mary Beth Norton has argued, Abigail Adams was one of those women who became stronger and more confident as a deputy husband during the American Revolution, despite the labor shortage and runaway inflation. "I should do exceeding well," she wrote John, "if we could but keep the money good, but at the rate we go on I know not what will become of us."[6]

B. Breadwinner (Merchant)

John Adams received his congressional commission as Minister to the Court of France on November 28, 1777. Though Mrs. Adams was exceedingly disappointed, having already been apart from her husband for three years, she encouraged him to go. As Mr. Adams wrote in his diary, "[m]y wife who had always encouraged and animated me, in all antecedent dangers and perplexities, did not fail me on this Occasion. . . ." Except for a month's return in 1779, he remained abroad, and was not joined by his wife in 1784. During that seven year period, when her farm management could not keep up with inflation, she improvised by selling scarce goods, which she imported from European manufacturers through John.

In her initial request, Abigail told John that debts were her "abhorrence" and that she would never borrow "if any other method can be devised." The method that she wished John to assent to was "to order some saleable articles. . . a trunk at a time, containing [goods worth] ten or 15 pounds Sterling, from which I may supply my family with such things as I need, and place in the hands of Dr. T[uft]'s Son who has lately come into Trade." Tuft's son would sell the extra goods for her "by which means if I must pay extravagant prices I shall be more upon an eaquel footing with my neighbours."[7]

John heartily accepted his wife's proposal, never questioning her judgment or expanded identity as merchant. The practice had become so standard that John Adams simply referred her orders to merchants on the continent, who then transacted business directly with Mrs. Adams.[8] Typically she dealt in textiles such as linen, gauze, shoe strings, ribbons, threads, and occasionally china and tableware. Her trade seemed to be successful, and she began to identify herself proudly as an independent woman who would burden neither her husband nor their friends. "It is true my spirit is too independent to ask for favours." Though they had friends who would assist her, she resolved, "whilst I can help myself I will not try them." Neither would she "ask a person to lend . . . money who would demand 30 per cent for it." She had "never borrowed for my expenses," nor would she. Thus it was the exception rather than the rule when she asked her husband for funds for their son Charles's passage back to America in 1782.[9]

C. Negotiator of Contracts

In addition to placing orders for importing saleable goods, Abigail Adams also stood as a contractor when she negotiated the terms of her husband's salary. The trick was to perform a masculine duty without appearing to break the bounds of prescribed femininity. In 1779 she wrote a member of Congress, John Lovell, to inquire about Mr. Adams's "accounts and vouchers." After offering the customary apology for "meddling" in politics, she told Lovell that she wished only "to know from time to time any important and interesting matters which may take place," and then proceeded to challenge Congress on the rate of exchange secured for her husband's salary. "I find that Congress are drawing Bill[s] at 25 for one upon Mr. Laurens and Jay to the amount of 100,000 Sterling. . . . Why I ask do they demand only 25 when 30 has been currently given here and 40 at Philadelphia[?]" Conscious of the restrictions on women discussing politics, and of her desire to get past them, she gave Lovell an exit and proceeded to ask for the information she needed. "You may always give me the go by, when I ask an improper Question and I shall take no umbrage but it will not be one I suppose to inquire after Mr. Adams's accounts and vouchers and to ask what has ever been done with them?" Mr. Adams was uninformed about his accounts and left Mrs. Adams "in charge that I should inquire after them."[10] Obviously John was neither threatened nor disapproving of Abigail's expansion into congressional business as his deputy husband.

Independence fueled more expansion. Thus in 1780, after seeing a diminution of her husband's title in a Philadelphia newspaper, it was no great feat for her to write to challenge it. The Philosophical Society had named her husband and John Jay as members, however Jay was given the title "His Excellency," while her husband was referred to only as "The honorable John Adams Esqr. late member of Congress." She did not consider it improper or unfeminine to question this discrepancy. Since both Jay and Adams were foreign ministers--Jay to Madrid, Adams to Passy--Mrs Adams believed that her husband ought to be given the same title as Jay, and wrote Elbridge Gerry to see if he could fix the matter. Mrs. Adams justified her grievance in political terms. "In a publick Society where they mean to Confer an Honorary Distinction, such things as these ought to be attended to, especially as they have a much greater influence abroad where Rank is considerd of more importance than in our Young Country."[11]

All of the roles that Abigail Adams assumed as a deputy husband expanded the definition of womanhood beyond domesticity. As a "directress" of farming, Deputy Adams learned that she could direct as well as take direction. As an importer she learned that she could judge the market and make a profit without relying on her husband's salary. As a negotiator and contractor, she learned to transact business and make claims rather than be the exchanged and claimed, thus reversing what Gayle Rubin has called "the traffic in women."[12] John welcomed this expansion, not because he had any feminist impulses, as we shall see, but because Abigail's assumption of these roles supported his endeavors as a man in pursuit of national independence and personal glory, and thus boosted, rather than threatened, his power.

II. Republican

In contrast to the ambiguous definition of "woman" within the varied roles of deputy

husband, "woman" in republican theory was unambiguously defined as subservient to the category "man." While the concept of womanhood had to be stretched as women performed formerly masculine tasks in the deputy husband identity, womanhood was defined restrictively in republican theory under the general, self-abnegating concept of feminine virtue.

Abigail Adams defined feminine virtue in terms of suppressed desires, personal sacrifice, and familial duty. One way that Adams suppressed her desires was to urge her husband forward in his service to the republic, rather than indulge in her economic, emotional, and sexual needs for him. "All domestick pleasures and injoyments are absorbed in the great and important duty you owe your Country," she wrote John, "'for our Country is as it were a secondary God, and the first and greatest parent. It is to be preferred to Parents, Wives, Children, Friends, and all things the Gods only excepted." This sublimation of desire to heroic republican duty supported Adams's definition of the self in republicanism as what Michael Sandel has recently called "encumbered" or "constitutive." The constituted self has meaning by virtue of its membership in the community into which it is born, rather than as a deontological, freely choosing individual who can put on or take off community obligations and norms like mere cloaks.[13] During the Revolution, the common good had to be the priority, for if it perished it would be "impossible to save an Individual as to preserve one of the fingers of a Mortified Hand." Thus did she "suppress every wish, and silence every Murmur, acquieceing in a painfull Separation from the companion of my youth, and the Friend of my Heart."[14]

Sacrifice was a virtue that Adams practiced with near masochistic rigidity. In October of 1777, when John obtained leave from Congress and returned to Braintree, Abigail became pregnant for the sixth time. In November, John was reelected to the Continental Congress, and in January he travelled to Baltimore, where Congress was in session. Mrs. Adams regretted his absence. and there is some indication that the intimacy of his brief stay in Braintree was prefaced with a promise of his presence if she got pregnant. She wrote John to express her anxieties about giving birth without his presence, but released him from obligation to her in a self-abnegating demonstration of her virtue: "that is a Satisfaction I know I must not look for," for giving birth without her husband might be necessary for the public good. "[T]ho," she added parenthetically, "I have a good ming to hold You to your promise since some perticuliar circumstances were really upon that condition." Instead, she put reason over her passions, and summoned "all the Phylosophy I am Mistress of since what cannot be helped must be endured."[15] At an age in which women commonly died from childbirth, this sacrifice was nothing less than masochistic heroism.

But in June of 1777 when the approach of Howe's army seemed imminent, she gave in to her "selfish" desires and begged John to come back. Conscious of her slip in virtue, she explained, "I used to have courage, but you cannot wonder at my apprehensions when you consider my circumstances. I can but poorly walk about the House. . . ." And yet, should he not come, she assured him, "I am not of an over anxious make; I will trust in Providence that I shall be provided for."[16] Again she implored him to come home, suggesting that he was avoiding his share in the "dreaded" event with her.[17] John never made it back. Abigail was resigned to writing him during labor between contractions, on July 10. "If there should be agreeable News to tell you, you shall know it as soon as the

post can convey it. I pray Heaven that it may be soon or it seems to me I shall be worn out. I must lay my pen down this moment, to bear what I cannot fly from --and now I have endured it I resume my pen and will lay down all my feelings and thank you for your obligeing letters." In the succeeding sentence she detailed the local news. "A prize arrived this week at Marblehead with 400 Hogsheads of rum aboard in by Manly.--Every article and necessary of life rises here daily. . . ."[18] Clearly Adams understood her labor in the absence of her husband and her continual duty to inform him about politics as the practice of republican virtue. The next day she gave birth to a girl, stillborn, as she had earlier feared it would be.

The theme of sacrifice continued as John was given a commission as minister to France. In February and March of 1788, he and John Quincy sailed to France aboard the Boston. Again Mrs. Adams was called on to exercise selflessness for the public good, which she did, as she waved husband and son farewell. This she could do because her marriage had been extraordinarily good, giving her "as much felicity, and as exquisite happiness as falls to the share of mortals. . . ." Furthermore, she understood her sacrifice of son and husband as an heroic act for her country. If the world did not recognize women's wartime virtues, she could "glory" in her own, "and derive pleasure" vicariously from her "intimate connexion with one who is esteemed worthy of the important trust devolved upon him."[19]

Abigail Adams had begun to define feminine virtue through self-abnegation, acquiescence, and service to her husband and family. As Edith Gelles has noted, Adams identified John's service to the country with the good of the country, and defended against loneliness and desperation by promoting an inflated image of him. Hearing erroneously in December of 1778 that her husband would be transferred to Holland, she quelled her anxieties for him with the theme of sacrifice and selflessness: "neither your own pleasure or satisfaction or my comfort or conveniency are to be consulted. Those were long ago sacrificed to the publick to whom you are devoted. . . ." It was his masculine duty to go wherever the republic demanded his service, and hers to "acquiesce, . . . to attend you whenever you think your own comfort, pleasure or satisfaction can be promoted by it. . . ."[20]

Mrs. Adams's conception of indirect virtue may have made her pains, tragedies, and unfulfilled desires easier to bear, but it also reified the ideology that was used to justify women's exclusion from citizenship. Defining her virtue as a personal sacrifice in the service of her husband, and his to his country reified the gender system that would devalue her contributions as natural and reward his as worthy of membership and office in the new polity. Thus in 1780 when she recalled her private loss in the stillborn child, she quickly converted her personal pain to public hope for the liberty of "ages yet unborn." Instead of mourning, she held "the flow of my heart upon this occasion," and reclaimed her virtue, absorbing her "whole Soul" in "the honour of my dearest Friend, the welfare and Happiness of this wide extended country," and "ages yet unborn."[21] The sublimation of her pain along with her commitment to vicarious pleasure in her husband's honor made the denial of women's rights easier--for her and for him. For while John's sacrifice might be compensated by the gain of national identity, Abigail's sacrifice would be recognized only by her family.

Not only did Abigail define virtue through the support of her patriotic husband, she

also defined virtue in her role as a republican mother,[22] As republican mother, her virtues were defined in educating her sons for citizenship. Letters to her son demonstrated that her republicanism was a blend of Christian and neo-classical concepts of the human telos and the common good. When John Quincy left for Europe with his father, Mother Adams told him that "the most amiable and . . . useful disposition in a young mind" was "diffidence of itself," which ought to lead him to "seek advise and instruction" from his father. She praised his "natural good understanding" and "spirits unbroken by adversity" but warned that his abilities, even if they were "superior" would be worth little "unless Virtue, Honour, Truth and integrety" were added to them. As a Christian mother, she reminded her son that he should remember his accountability to his maker for all of his words and action. Like a Spartan mother sending her son to die on the battlefield, she told hers that she would rather he suffered an early death crossing the Atlantic than be seen "as an immoral profligate or a Graceless child."[23] One was not a self-reliant, but a dependent being; one owed one's existence to God. Dependence on God begot duty and the human telos. The purpose of a moral life was not "to rove from clime to clime, to gratify an Idle curiosity." Rather "every new Mercy" one received was to be understood as a "New debt" or "obligation" upon oneself "to a diligent discharge of the various relations" in which one stood connected," first to the "Great Preserver," next to "Society in General, in particular to your Country," and finally to one's parents and oneself.[24]

Since God was the Being to whom one's ultimate duty was owed, "[t]he only sure and permanant foundation of virtue" was "Religion," that is, a "Belief of the only God, . . . who superintends and Governs all Nature . . . but more particularly regards Man whom he created after his own Image . . . ." God "[b]reathed into him an immortal Spirit capable of a happiness beyond the Grave," but to attain such happiness, man was "bound to the performance of certain duties which tend to the happiness and welfare of Society" and were "comprised in one short sentence . . . thou shalt Love thy Neighbor as thyself. . . " Quoting Pope in his "Essay on Man," Mother Adams reminded John Quincy to "Remember, Man, the universal cause/ Acts not partial, but by general laws/ And makes what happiness we justly call/ Subsist not in the good of one but all/. . . ."[25]

Once Mother Adams successfully ordered individual happiness as a product of the common good, she had only to link religious with civic virtue. She did this by claiming that God's greatest good was for humans to live in community. "The Supreme Being made the good will of Man towards his fellow creatures an Evidence of his regard to him, and to this purpose has constituted him a Dependent Being, and made his happiness to consist in Society." Since man was dependent on society for existence, as Adam required Eve even in Eden, man owed society the "duties" of "Justice, humanity, and Benevolence." These duties were extended to the country, but had to be supplemented with "the additional obligation of sacrificeing ease, pleasure, wealth and life itself for its defence and security." To his parents, he owed "Love, reverence and obedience to all just and Equitable commands." To himself, he had a duty "[t]o become what you ought to be" and what his "fond Mother" wished for him, which was to live by good precepts. For this, "one of the most usefull Lessons of Life" was "the knowledge and study of yourself." One had to be wary of "Self Love" and "partiality," character defects that "cast a mist before the Eyes."

True to late eighteenth century republicanism, she emphasized that he must learn to

govern his passions with the "countroul of Reason," which was the key to both public and private good. Governing the passions was essential to human happiness because "passion unrestrained by reason[,] cooperating with power" had "produced the Subversion of cities, the desolation of countries, the Massacre of Nations, and filled the world with injustice and oppression." His own country was a case in point; it suffered "from the Effects of Lawless power and Malignant passions. . . ." Once he learned self-government, she promised, he would "find a foundation laid for happiness" in himself and "usefullness" for Mankind."[26]

The definition of virtue as the sacrifice of personal desires and duty to God and country situated Abigail Adams in the company of her neo-classical republican friend Mercy Warren. Like Warren, Adams preached duty, sacrifice and the ascendence of reason over the passions. Both women also defined the category "woman" in republican theory as subservient to the category "man." The telos of "man" was to serve his community and share in its leadership. The telos of "woman" was to serve "man," and to take pride in the honor bestowed upon him, rather than to request honor or glory for herself. Thus, in contrast to the deputy husband definition of woman as man's replacement--which expanded womanhood beyond domesticity to the outer edges of the public realm--the republican definition of womanhood was restrictive, underscoring the gendered distinction of public and private, and minimizing women's contribution to the republic. Both roles defined women as men's servants, however, the deputy husband role upheld women's demonstration of equal competence while the republican wife role reified "woman" as a private sacrificial being whose purpose was to support the "public" virtues of her husband. This supportive, self-abnegating role conferred and inflated John's phallic sufficiency,[27] which enabled him to receive the glory of citizenship, political office, and notoriety, while she took pleasure in her suffering and the vicarious glory of her instrumentality.

III. Abigail Adams as Feminist

During the War Adams developed a feminist identity, which was in tension with her republican wifehood identification. By "feminist," I mean that she was aware of and critical of the structure of patriarchy, and resisted the definition of "woman" within that system. Adams criticized the structure of what Pateman has so aptly termed "modern patriarchy,"[28] in anticipation of the American founding. The critique can be found in her "Remember the Ladies" letter, quoted without exception in every biography on Abigail Adams.

Adams's feminism consisted of a critique of "male tyranny," or the absolute power of (white) men, which at that time manifested itself in the institutions of slavery and coverture. As I explained in Chapter Three, the legal tradition of coverture that continued in America, despite the Revolution, deprived women of a direct relationship to the state by subsuming the identities of every married woman into her husband's as her "Lord" or "Baron." Adams had her finger on the pulse of revolutionary theory when she criticized slavery and coverture as theoretically and morally inconsistent with the revolutionary principles of equal liberty. The institution of slavery was "a most iniquitous Scheme," defying revolutionary logic since whites were fighting for that freedoms that they were "daily robbing and plundering from those who have as good a right to freedom as we have."[29] Keeping the institution of coverture intact made no sense since white men would become free citizens, but women

would remain the "vassals" of their husbands. Thus the preservation of both slavery and coverture preserved a white male tyranny, despite the Revolutionary rhetoric to combat tyranny and absolute power.

A. "Remember the Ladies"

Adams's critique of modern patriarchy was more concerned with the status of white women than slaves of either sex. This critique can be found in her famous "Remember the Ladies" letter of March 31, 1776, in which she applies revolutionary radicalism to the status of women.

> I long to hear that you have declared an independancy--and by the way in the new Code of laws which I suppose it will be necessary for your to make I desire you would Remember the Ladies, and be more generous and favourable to them than your ancestors. Do not put such unlimited power into the hands of Husbands. Remember all Men would be tyrants if they could. If perticular care and attentions is not paid to the Laidies we are determined to foment a Rebelion, and will not hold ourselves bound by any Laws in which we have no voice, or Representation.
>
> That your Sex are Naturally Tyrannical is a Truth so thoroughly established as to admit of no dispute, but such of you as wish to be happy willingly give up the harsh title of Master for the more tender and endearing one of Friend. Why then, not put it out of the power of the vicious and the lawless to use us with cruelty and indignity with impunity. Men of Sense in all Ages abhor those customs which treat us only as the vassals of your Sex. Regard us then as Beings placed by providence under your protection and in immitation of the Supreem Being make use of that power only for our happiness.[30]

The meaning of this letter has been the subject of scholarly disagreement. Most read the letter narrowly as a limited request for legal protection against wife abuse, and not as a plea for woman suffrage.[31] Lynne Withey has suggested that the letter could be read as a feminist plea for suffrage, but rejects that interpretation on the grounds that Adams was content with separate, gendered spheres, and because she was no "social" revolutionary, despite her war-time efforts. L. H. Butterfield, Marc Friedlaender, and Mary-Jo Kline have suggested that Adams did mean to argue for "equal rights," but that she happily accepted John's refusal, since she experienced no gender subordination in her own life, and often came independently to the same conclusions about most political issues. Phyllis Levin obliquely refers to the letters "breadth," but does not specify whether it included a plea for equal rights, or woman citizenship.[32]

I read the letter broadly as a critique of coverture and a proposal for woman citizenship. According to the eighteenth-century jurist William Blackstone, the institution of coverture stipulated that "by marriage, the husband and wife are one person in law: that is, the very being or legal existence of the woman is suspended during the marriage, or at least

is incorporated and consolidated into that of the husband. . . ."[33] In the eighteenth-century marriage contract, as Pateman has argued, the woman exchanges her obedience for her husband's protection; but this was hardly an equal trade. The denial of married women's legal personhood entailed a widely oppressive definition of the category "woman," which not only barred women from independent property ownership (except in rare cases) and political rights, but also from the possibility of suing a husband for marital rape or other abuses. Had Adams meant narrowly to criticize the lack of protection against wife-beating, she would not have needed to describe the problem broadly as the "tyranny" of men, or prescribe "representation" of women to topple it.

Adams clearly meant to apply the revolutionary rhetoric of freedom and equality to a critique of the institution of coverture. For it was coverture that put "unlimited power into the hands of Husbands," making them patriarchs in their families, or male "tyrants." The threat of "fomenting a rebellion," against laws "in which we have not voice or representation," was a broad application of revolutionary logic to the tyranny of men. That Adams felt her representation as a woman denied by coverture obviously indicated that she rejected the concept of "virtual" representation for women through their husbands, and pleaded for women's "actual" representation as citizens in their own right.

John Adams ridiculed his wife's proposal. "As to your Extraordinary Code of Laws, I cannot but laugh." Having necessarily to dodge revolutionary principles, he threatened chaos in opening the franchise to Negroes and Indians, and worst of all, the "tribe" of women. "We have been told that our struggle has loosened the bands of Government everywhere. That Children and Apprentices were disobedient--that schools and colledges were grown turbulent.--that Indians slighted their guardians and Negroes grew insolent to their Masters. But your letter was the first Intimation that another Tribe more numerous and powerfull than all the rest were grown discontented."

John's more successful strategy with his wife was to argue against woman citizenship from the ideology of sexual difference and separate spheres. Women's sexuality made them more powerful than men in the domestic sphere, thus women actually ruled men despite their exclusion from politics. "Depend upon it," he told her, "[w]e know better than to repeal our Masculine systems. Altho they are in full Force, you know they are little more than Theory." Echoing Rousseau, John argued that women's sexual mastery in the private realm necessitated subjecting them to men's power in the public realm.

> We are obliged to go fair, and softly, and in Practice you know We are the subjects. We have only the Name of masters, and rather than give up this, which would completely subject us to the Despotism of the Peticoat, I hope General Washington, and all our brave Heroes would fight. I am sure every good Politician would plot. . . against Despotism, Empire, Monarchy, Aristocracy, Oligarchy, or Ochlocracy."

Fear of castration through the "Despotism of the Peticoat," was John's ultimate rationale for lumping the category "woman" with the already excluded Other, that is, those disenfranchised persons who would also threaten the ranking system of American manhood, namely "Tories, Landjobbers, Trimmers, Bigots, Canadians, Indians, Negroes, Hanoverians,

Hessians, Russians, Irish Roman Catholicks, [and] Scotch Renagadoes. . . ."[34]

Feminist Adams was obviously disappointed by her husband's objections to woman citizenship. She confided in her friend Mercy Otis Warren, hoping to win her support, and with it, protest the state. "I think I will get you to join me in a petition to Congress. I thought it was very probable our wise Statesmen would erect a New Government and form a new code of Laws. I venture[d] to speak a word in behalf of our Sex, who are rather hardly dealt with by the Laws of England," that is the institution of coverture, "which gives such unlimited power to the Husband to use his wife Ill." Applying the revolutionary principle of placing limits on authority, she "requested that our Legislators would consider our case," and check the "natural propensity in Human Nature to domination," by erecting "the most generous plan," which would "put it out of the power of the Arbitrary and tyranick to injure us with impunity by Establishing some Laws in our favour upon just and liberal principals."[35]

The problem of women's "injury" may have been wife-beating, but the "most generous plan" to check the "domination" of "Arbitrary and tyrannick" men would have been a system of equal rights for women. Adams contrasted "Liberal principles" with John's failing virtue, which was neither "disinterested" nor "generous," but rather corrupted by self-interest. For he proclaimed "peace and good will to Men, Emancipating all Nations," yet "insist[ed] upon retaining an absolute power over Wives." Women's "voice" and "representation" would have checked such male domination, toppling the patriarchal power of the King and the husband/father in one fell swoop.

Adams never obtained support from Warren who, in 1776, was more interested in winning John Adams's approval for her intellect than challenging the system of modern patriarchy. Thus Adams began seriously to consider an alternative strategy of sexual subversion, and playfully warned John about her private power to bend him to flaccidity. "[R]emember that Arbitrary power is like most other things which are very hard, very liable to be broken--and notwithstanding all your wise Laws and Maxims we have it in our power not only to free ourselves but to subdue our Masters, and without violence throw both your natural and legal authority at our feet--/Charm by accepting, by submitting sway/ Yet have our Humour most when we obey."[36]

While Adams discussed her proposal for woman citizenship with Mercy Warren, John discussed strategies for denying women citizenship with James Sullivan, only eight weeks after Abigail wrote her "Remember the Ladies" letter. If the "only moral Foundation of Government is the Consent of the People," he asked, "to what extent Shall we carry this Principle? . . . Shall we say that every Individual of the Community, old and young, male and female, as well as rich and poor must consent, expressly to every Act of Legislation?. . . "Whence arises the Right of the Men to govern the Women, without their Consent?. . . Why exclude women? Consent of the governed was obviously not the only moral foundation for legitimate rule. Despite his wife's demonstration of farm mastery, John concluded that women's "delicacy" rendered them "unfit for Practice and Experience, in the great Business of Life, and the hardy Enterprises of War, as well as the arduous Cares of State." "Besides," he added, "their attention is so much engaged with the necessary Nurture of their Children, that Nature has made them fittest for domestic cares."

A little deconstruction quickly reveals that John's reasoning is embedded in deep

circularity. Women should be excluded from the franchise because they are preoccupied with necessary childrearing. Since "nature" intended women for childrearing, it is also natural that women should be confined to domesticity and excluded from citizenship. The merging of masculine dictates with those of God or nature--the posited first cause- complete the circle of reason. Men ruled that women were unfit for politics, and then concluded that Nature intended it so. Thus God is man, and first and second cause become interchangeable. Had John Adams reasoned instead that women's "sphere" was contingent upon their exclusion from politics and rights, his argument for denying women suffrage would have failed. The circle of reason bought time--about a hundred and fifty years--before women had began to break it.

Should the argument about women's "natural" delicacy fail, the second strategy for excluding women from citizenship, also deeply circular, posited women's "natural" dependence. John asserted that women were like men "who are wholly destitute of Property," that is, "too little acquainted with public affairs to form a Right Judgment, and too dependent upon other Men to have a Will of their own. . . ." Or: women were dependent like the poor and children, "for generally speaking, Women and Children have as good Judgment, and as independent Minds as those Men who are wholly destitute of Property: these last being to all Intents and Purposes as much dependent upon others, who will please to feed, cloath and employ them, as Women are upon their Husbands, or Children on their Parents. . ." On Deconstruction, the argument takes this form: women are dependent under the law of coverture, and thus dependent by nature. Since women are naturally dependent, the law of coverture is natural, god's law. Thus, once again, man and God are conflated, and women's "vassalage," was said to reflect a "natural" incapacity for independent property ownership, the prerequisite for independent moral judgment. Women's exclusion from citizenship was merely man's law, but God's law, as well.

John admitted to Sullivan his aim to restrict the distribution of power to a limited number of white men. He warned Sullivan that it was "dangerous to open so fruitfull a Source of Controversy and altercation. . . as would be opened by attempting to alter the Qualifications of Voters." There would be "no End of it." New Claims would arise. "Women will demand a Vote. Lads from 12 to 21 will think their Rights not enough attended to, and every Man, who has not a Farthing will demand an equal Voice with any other in all Acts of State." The real problem was that opening the franchise would "confound and destroy all Distinctions, and prostrate all Ranks, to one common Levell." John Adams was a firm believer in ranks and levels--not only those separating blacks and whites and men and women, but also men and other men.[37]

B. "Daughters are wholly neglected in point of Literature"

As deputy husband, Abigail Adams resisted another aspect of modern patriarchy in 1776 when she protested the disparity of education between the sexes. This protest was waged on two grounds: failing to educate women was detrimental to children's education, as well as a patriarchal strategy to restrict women from knowledge, judgment, and a share in political power.

1. "If we mean to Heroes, Statesmen, and Philosophers. . . "

Educating her children, Adams found herself "soon out of my debth, and destitute and deficient in every part of Education." To remedy this problem she proposed to John "that some more liberal plan might be laid and executed for the Benefit of the rising Generation," and that the "new constitution" would be "distinguished for Learning and Virtue." Systematic education for girls as matter of constitutional right would benefit men, who would in turn serve their country. "If we mean to have Heroes, Statesmen and Philosophers, we should have learned women." Even this benevolent foundation for a female right made Adams self-conscious: "[t]he world would laugh at me, and accuse me of vanity, but . . . I have a mind too enlarged and liberal to disregard the Sentiment."[38]

John Adams wholeheartedly agreed that learned women benefitted men, but he showed no interest in establishing public education for girls as a constitutional right. He feared the proliferation of "Femmes Scavans," and "Pedants," but lauded the supportive woman behind the great man. History proved that every "great Character, whether a General or a Statesman, or Philosopher," was supported by "some female about him either in the character of a Mother, Wife, or Sister," with "Knowledge and Ambition above the ordinary Level of Women, and that much of his Emminence" was owed "to her Precepts, Example, or Instigation, in some shape or other."[39] The proper role for a talented woman was not on center stage, as Judith Sargent Murray would later argue,[40] but strictly in the private sphere. "Aspasia the wife of Pericles," for example, taught her husband "his refind Maxims of Policy, his lofty imperial Eloquence; nay, even composed the Speeches, on which so great a Share of his Reputation was founded." So extraordinary was this lady that "[t]the best Men in Athens frequented her House, and brought their Wives to receive Lessons from her OEconomy and right Deportment. Socrates himself was her Pupil in Eloquence and gives her the Honour of that funeral Oration which he delivers in the Menexensu of Plato. . . ." John's resistance to his wife's proposals was insinuated in his idealization of extraordinary women, and his sarcastic wish that "some of our great Men had such Wives."[41]

2. The "Tyranny" of Men Barring Women from "ingenious education"

John touched on the subject again in April of 1778, when he boasted of the intellects of French women. "I admire the Ladies here. Dont be jealous. They are handsome, and very well educated. Their accomplishments are exceedingly brilliant. And their knowledge of Letters and the Arts, exceeds that of English Ladies much, I believe."[42] Abigail took the opportunity, once again, to criticize "the trifling narrow contracted Education of the Females of my own country," and to call on John's "more generous and liberal Sentiments" to combat the ridicule of female learning. No doubt aware that John was neither generous nor liberal when it came to sharing state power, Abigail resorted to the commentary of some unnamed but admired male author to protest the exclusion of women from serious education as a power play in sexual warfare. If women were men's "enemies," then men were cowards to disarm them of the same "weapons" that men used in sexual warfare. But if women were men's friends, it was "an inhumane Tyranny to debar them of priviliges of

ingenious Education which would also render their Friendship so much the more delightfull to themselves and us."

The claim of male tyranny never appealed to John's sense of justice, thus it was no surprise that Abigail argued for equal "ingenious" education from republican wife rhetoric. As men's supporters, educated women would become more "polite and charming creatures," whose "brighter intellects" made them more beautiful, not more powerful. This justification contained the promise, from one male author(ity) to another, that women would not outshine men intellectually, "[n]or need we fear to loose our Empire over them by thus improveing their native abilities since where there is most Learning, Sence and knowledge there is always observed to be the most modesty and Rectitude of manners."[43]

Abigail expressed her frustration with male tyranny in her letters to John Thaxter, her husband's assistant. "[T]he difference of education between the male and female Sex, even in those families," like her own, where Education was "attended to" was "mortifying." "Every assistance and advantage which can be procured is afforded to the sons, whilst the daughters are totally neglected in point of Literature. Writing and Arithmatick comprise all their Learning." With John Thaxter, Adams gave the republican mother justification, but the emphasis was on the injustice to women rather than the promise of non-threatening service to men. "Why should the Females who have a part to act upon the great Theater" as mothers, "a part no less important to society," be "suitably qualified for the Trust, Especially when we consider that families compose communities, and individuals make up the sum total." And then again, why would men "wish for such a disparity in those whom they one day intend for companions and associates[?]" Answering her own question, she could not avoid "sometimes suspecting that the Neglect arises in some measure from an ungenerous jealousy of rivals near the throne."[44] Proving himself more "liberal" than Mr. Adams, Thaxter agreed with Abigail that men denied women education to restrict power to themselves. "After mentioning that our sex wish a disparity, you subjoin a suspicion that Jealousy of rivalship is the foundation of the neglect of your sex. Madam, I am positive it is too often the case. It is an 'ungenerous Jealousy' as you justly term it."[45]

Two points follow from Adam's dual strategy for attaining female education rights. The republican motherhood strategy employed the argument that women performed a vital service to the community, for which they ought to be rewarded with equal education with men. The failure to educate girls would be a detriment to the republic, since women would be less able to educate their children. The second strategy was deconstructive. It reduced the exclusion of girls from education as plain sexual warfare. Men denied women and girls knowledge to keep power in their own hands. Denying girls equal educational opportunities kept the circle of sexist reason unbroken. It maintained the definition of "woman" as a naturally dependent, domestic being, unfit for participation in the "public" realm, which in turn validated the definition of female "nature" as incapable of independent rationality and judgment, and thereby maintained the conflation of God with man. Clearly, Abigail's deconstructive strategy was an attempt to resist the patriarchal definition of "woman."

C. Adams joins Warren in critique of Lord Chesterfield

A third feminist act that Abigail Adams performed was her support of Mercy

Warren's critique of Lord Chesterfield as a Libertine. As I discussed in chapter three, Mercy Warren wrote a letter to her son, in which she attempted to dissuade him from Chesterfield's teachings on sexuality. Chesterfield blamed women for male licentiousness, but Warren argued that "human nature" was "the same in both sexes." Thus the focus on women as the cause of licentious manners was simply bad custom. Men and women frequently reached the same moral heights or sunk to the same level of depravity, but men like Chesterfield unjustly "branded liscentious manners in female life with peculiar marks of infamy."[46] In February of 1780, Abigail Adams's seconded Mercy Warren's conclusion that Chesterfield was a "libertine" whose teachings about women were an "abuse upon our sex." Adams requested a copy of Warren's letter,[47] which she arranged to publish in the Independent Chronicle (Boston). It appeared in print on January 18, 1781.[48]

This act was a concerted feminist effort among women to protest a pejorative characterization of themselves which was frequently used to exclude them from the category of the rational individual, and thus the public realm as well. Thomas Jefferson, for example, viewed women as seductive temptresses, whose uncontrolled passion would cause chaos and anarchy if allowed to mix with men in matters of public business.[49] By seconding Warren's sentiments that moral human nature was the same in both sexes, Adams resisted the patriarchal definition of "woman" as a creature defined by insatiable sexual desire, and thus incapable of a rational voice worthy of representation.

III. "It is Scarcely Reputable for Young Ladies to Understand Latin and Greek"

One would think that Abigail's critique of sexist educational opportunities might lead her to pay special attention to her daughter's education. In 1776, her most radical year, she did: she began to teach Nabby Latin and Greek. John, however, discouraged his daughter from pursuing it further because it was unladylike. "You must not tell many people of it, for it is scarcely reputable for young ladies to understand Latin and Greek--French, my dear, French is the language next to English--this I hope your mamma will teach you."[50] He may have killed her appetite for learning in general, for there was no further evidence of his daughter's interest in Greek, or any other academic subject.

On the other hand, John Adams raised and educated his second child John Quincy for nothing less than statesmanship. At first Father Adams instructed his son from afar. He directed his wife to instruct their son in the great republican virtues of "Temperance, Justice, Magnanimity, Honour, and Generosity." John Adams intended to educate John Quincy to become "a wise and great Man." Abigail was to have him to read the newspapers for current events, history for lessons on virtuous and despotic characters, and the classics to understand the rise and fall of republicanism. Thus Father Adams sent his son a formidable bibliography of classics in July of 1777 for his present and future reference.[51] At age eleven, John Quincy accompanied to his father to Holland. At age thirteen, he enrolled at the University of Leyden. There he studied Phadreus's Fables, along with other Greek and Latin classics, by which his father intended he would learn the difference between wisdom, virtue, vice, and folly.[52] Further, Adams asked John Quincy to must inform himself "as perfectly as possible concerning the Origin, the Progress, the Institutions, Regulations, Revenues, &c. of that celebrated University, and especially to remark every Thing in it, that

may be imitated, in the Universities of your own Country."[53]

The education and support for John Quincy proved successful and useful in just a few years. A few days before his fourteenth birthday he became the unpaid secretary to Francis Dana, who was appointed Minister to Russia in July of 1781. Dana requested the John Quincy's services since he could "easily translate in writing, as Mr. Dana had seen, any state paper," from French to English and English to French.[54] Father Adams was continued to express his concern for his son's education even in his role as teenage foreign secretary. With no college to be found, he should follow his own course of study with "assiduity," and take more pains with his handwriting, resolving "never to write the most familiar Letter or trifling Card, with[out] Attention and care. . . . "[55] At one point Father Adams discovered, to his "mortification," that his son was wrote "better in a foreign Language" than in his "mother Tongue," but lacked style in both. He quickly prescribed an academic antidote of intercourse with works by "the best Writers in both," whose Spirit he was to "penetrate" and whose "Fires" he should allow to "warm" and "inflame" his own. To summarize, Father Adams counseled John Quincy on his daily and long-term educational goals, as well as his penmanship and writing style. He continually challenged John Quincy to reach beyond his current abilities to prepare him for a great role on the world stage. Mother Adams also challenged her son to aspire for greatness. In addition to her in-depth letters on republican theory, she impelled him to "consider that every Moment of your time is precious, if trifled away never to be recalled." He was to aspire, in whatever he undertook, "to make yourself perfect in it, for if it is worth doing at all, it is worth doing well."[56]

Aside from discouraging Nabby from learning Greek and Latin, no such fatherly attention was paid to Nabby's education. While John sent Abigail specific instructions for John Quincy's studies, he wrote that his "dear Daughters education" was near his heart. Obviously it was not at the center, since he could only add that she was "a modest and discreet Child" with "an Excellent Disposition, as well as Understanding."[57] On one or two occasions, Father Adams did write his daughter of historical and geographical facts from his European journeys in his "Moments of Leisure, to inform you of any Thing that I observe which may contribute to your improvement or Entertainment." Rather than engaging her with questions or assignments, Father Adams suggested that "Arts and Accomplishments" that were "wholly ornamental" should not be a priority in a woman's education. With somewhat lowered aspirations for his daughter than his wife, he told Nabby that the primary purpose of girls' education was to make them "useful" to "act their Parts well in the various "Relations of Life, those of Daughter, Sister, Wife, Mother, Friend."[58]

Nabby Adams received few letters and wrote even fewer herself. Though her mother encouraged her to keep up correspondences with her brothers, she was too ashamed of her lack of education to write. "I cannot prevail with your Sister to write"--Mother Adams told her son--"I believe she is affraid you will shew her Letters and she is so proud that she thinks she cannot write well enough. I do not like it that she is not more socible with her Brothers."[59] When she did write John Quincy, she expressed women's "anxiety of authorship."[60] She was "sensible of her own unworthiness," but excused herself as a female whose "lot" was "to pass my time in a very contracted Sphere." "I have scarcely visited as many towns as you have kingdoms."[61]

John Adams did offer his daughter a few republican principles for living, but only

after she requested him to send her jewels and lace from Europe for her embellishment. He was disappointed that she had not instead asked for a copy of "Bell's British Poets." In a paltry effort to correct years of neglect of his daughter's education, Adams began by telling her "if you have not yet so exalted sentiments of the public good as have others more advanced in life, you must endeavor to obtain them." The principles underlying the public good consisted of "the primary and most essential branch of general benevolence, and therefore the highest honour and happiness both of men and Christians, and the indispensible duty of both." She should avoid "Malevolence," which was "its own punishment, even in this world." "Indifference to the happiness of others" was also a vice because it arose from "insensibility of heart, or from a selfishness still more contemptible, or rather detestable."[62]

Adams condensed the lessons of the Greek polis, the fall of Rome, and histories of revolutions in the west into a mere hundred words. If she could understand the general concept of benevolence, she could probably be trusted to understand commitment to the public good as the highest virtue. "But for the same reason that our own individual happiness should not be our only object, that of our relatives, however near or remote, should not; but we should extend our views to as large a circle as our circumstances of birth, fortune, education, rank, and influence extend, in order to do as much good to our fellow men as we can." This brief lesson in civic virtue as the foundation of moral society and human happiness was his answer to a daughter who had assumed her lot, as an ornament, perhaps too well. Father Adams preferred the industrious and "useful" woman over the ornamental woman. "[J]ewels and lace can go but a very little way in this career. Knowledge in the head and virtue in the heart, time devoted to study or business, instead of show and pleasure, are the way to be useful and consequently happy."[63]

Father Adams failed to engage his daughter in intellectual deliberation, or to create structured opportunities for her intellectual growth. Instead he discouraged her from learning Greek and Latin, and gave her what Aristotle called "right opinion," that is the flat reason that must be taken on faith for those supposedly lacking the rational capacity for general reason. The objection might be raised that the young Abigail was simply not as talented as her brothers; but this conclusion would be difficult to draw given the gaping distinctions between hers and John Quincy's educational environments. Furthermore, there is no indication that the younger Charles Adams fared better in life than his sister, despite his advantages. Like John Quincy, he was educated in Europe as a boy, but died of alcoholism at the age of thirty. John's lack of concern for his daughter's education reified his construction of woman as a "dependent being," naturally incapable of political judgment, and thus undeserving of citizenship. The circle of reason protecting the limited franchise spiraled down to the next generation. Nabby Adams accepted her "lot," in a narrow, contracted sphere of domesticity without protest, despite her mother's proposals for equal educational opportunities as a matter of right, as well as in family practice.

IV. The Transition to from Feminism to Separate Spheres

The question as to whether or not Abigail Adams was a feminist has been discussed and decided negatively in the context of her endorsement of separate spheres; these writers

seem to assume that domesticity and woman citizenship were opposing categories, as they have been in the twentieth century, but it is my claim that they were not antithetical in Adams's mind in the eighteenth century. Instead, I argue that Adams challenged the boundary between public and private by viewing domestic work as a contribution to the republic that was worthy of woman suffrage and public honor. In contrast to Edith Gelles,[64] I argue that though Abigail Adams was comfortable as a domestic being, she did "suffer conflicts over her place in the world," and her role in society. The question, then, is not whether Adams was a feminist or a domestic woman, but why and when she abandoned her feminist critique of the state and acceded to the ontology of sexual difference and its concomitant ideology of separate spheres. Why was Abigail Adams so willing to give up her political struggles for woman citizenship and defer to her husband's will?

A. From Sexual Performance to Sexual Difference

As we have seen, Mrs. Adams began to play with a "difference" strategy to assert female power when she accepted her husband's theory on the power of the petticoat in the Spring of 1776. When she failed to convince him that women deserved actual, rather than virtual representation in government she warned him to beware of the subversive power of women, who

> Charm by accepting, by submitting, sway
> Yet have our humour most, when we obey.[65]

This sex play suggested that feminine charm and submission was rather a strategic act than a natural determinant of womanhood.

By the end of 1780, however, Adams's ruminations on sexual difference were no longer playful. She had received far fewer letters from her husband than she had sent (most were lost at sea or confiscated); it was Christmas, and she was felt "alone in the wide world, without anyone tenderly to take care of me, or lend an assisting hand through the difficulties" that surrounded her. Reflecting on her pain and her husband's apparent lack of it, she suggested that women were more emotional than men: "Man is active resolute and bold/ Woman is fashioned in a different mold." Men were "[m]ore independent by Nature," scarcely able to "realize all those ties which bind our sex to his." It was now "natural" that as women's dependence was greater, their attachment to others was also stronger.[66] Two years later, still miserable in her separation, she moved from contingent to natural female misery, paraphrasing the Bible. "Desire and Sorrow were denounced upon our Sex: as punishment for the transgression of Eve." Since women were "[m]ore tender and susceptible by Nature" to "those impression[s] which create happiness or misiry," they Suffer[ed] and enjoy[ed] in a higher degree" than men did. In contrast to the younger Judith Sargent Murray, who attributed social inequality to Biblical and institutional sexism, Adams now accepted divine punishment as the explanation of woman's cultural misery. Instead of attributing her unhappiness to the glory of her self-abnegating sacrifices, Adams now turned her misery toward her femaleness. "I never wonderd at the philosopher who thanked the Gods that he was created a Man rather than a Woman."[67]

Adams's use of the word "penetration" might also suggest a theoretical move toward natural sexual difference as the foundation of the gender system. She twice used the concept of penetration to stimulate men to rise to public virtue, suggesting a link between the phallus and the public realm. She urged Jonathon Mason forward with Sullivan's army troops as a condition of his manliness. The virtues of "[p]enetration and wisdom" were the "fruits of experience, not the lessons of retirement and leisure." "Ardour and generosity" could not be gained passively through solitary "reflection or knowledge;" but were the rewards that issued from of a mind "raised and animated" in the scenes of action.[68]

Adams used these oppositions of penetration and passivity to arouse John Quincy to manhood as well. Yielding to the separation that she had originally resisted, she now masculinized him for his second stay in Europe in 1780. These were "times in which a Genious would wish to live. "Great characters" were not formed "in the still calm of life, or the repose of a pacific station. . . . Would Cicero have shown so distinguished an orator, if he had not been roused, kindled and enflamed by the Tyranny of Catiline, Millo, Verres and Mark Anthony[?]." No. "The habits of a vigorous mind" were "formed in contending with difficulties." "Wisdom and penetration" came from active "experience," not the "Lessons of retirement and leisure." Great causes called out great virtues, which could only "wake into life" when the mind was "raised, and animated by scenes that engage the Heart." This hard-won wisdom and penetration formed not only the character of the soldier, but of "the Hero and the Statesman" as well. Or, put differently, only those who penetrated became heroes and statesmen, and to penetrate, one had to be active, confrontational, and brave--a real man.[69]

Another indication of Adam's acceptance of natural sexual difference and separate spheres was her praise of Fordyce in 1782, as an ally "to whom our Sex are much indebted for the justice he has done them. . . ." As Mary Beth Norton has shown, the Reverend James Fordyce was a *conservative* theorist of gender. He offered a justification for restricted female education based on a theory of sexual difference. Since women had a "defect in point of depth and force," but enjoyed a refined "sentiment" and more insight into human characters, he recommended that women narrow their interests to "refined" rather than "profound" subjects.[70] This was hardly in line with Adams's earlier proposal for an "ingenious" education for women that aspired beyond reading and arithmetic. She now praised Fordyce for his claim that women with good manners provided the "best School" for "conscientious" and "moral" men to learn "proper demeanor, the easiest turn of thought and expression and right habits of the best kind."[71] The ideology of separate spheres began to dominate of her thinking on gender. She now claimed that "the virtuous fair" would soften men's "rusticity and asperity" in the private realm and refine it to "benevolence and philanthropy." Women would take selfish, "ungenerous" men and teach them "graces" without "sacrificing the[ir] virtues."[72] That is, women would bend men with their tenderness, rather than castrate them through political competition.

Adams's use of binary oppositions like hard/soft, penetrating/passive, confrontation/retirement, and bold/miserable, to describe male/female rested on a shifting foundation. Her ontology of difference vacillated between the natural and preordained, on one hand, and the socially constructed on the other. In addition to her religious explanation for women's suffering in 1782, Adams recognized women's suffering as the consequence of

male domination. Women suffered because the country failed to recognize their virtuous acts as worthy of citizenship. "Patriotism in the female Sex is the most disinterested of all virtues. Excluded from honours and from offices, we cannot attach ourselves to the State or Government from having held a place of Eminence." Women gave to the public cause, though they were still guaranteed to live under the tyranny of men through the law of coverture. "Even in the freest countrys our property is subject to the controul and disposal of our partners, to whom the Laws have given a sovereign Authority." Coverture rendered women "[d]eprived of a voice in Legislation, obliged to submit to those Laws which are imposed upon us," and thus, she reasoned, "is it not sufficient to make us indifferent to the publick Welfare?"[73] As much as she credited her own contributions to the public good, Adams was also clearly disillusioned with republicanism and the concept of "virtue," which systematically devalued women's domestic contributions by excluding women from citizenship.

Adams's transition from feminism to separate spheres began in the last half of the Revolutionary period, but not without equivocation. After John ridiculed and refused her proposal for woman citizenship, and put forth his view of women's sexual mastery in the private realm, Adams played along, threatening to subvert the denial of woman citizenship within their marriage. She explored the idea that women's suffering was preordained, and appeared to have accepted it as women's lot. Yet, in the same period, she also identified and resisted women's exclusion from politics as an oppressive social construction which was inconsistent with the liberal principles of the revolution. This fact is overlooked by such fine scholars as Akers, Hoff, and Gelles,[74] who miss the point of Adams's critique of coverture, virtual representation, and the male bias of "virtue," and conclude that she completely accepted the ideology of separate spheres undergirding women's exclusion from politics.

To view Adams as a conventional woman in this sense is not only to deny or minimize her critique of modern patriarchy, but to take her espousal of separate spheres during and after her period as First Lady at face value. For it was then that she endorsed separate spheres ideology unequivocally, despite her obvious immersion and inclusion in male-dominated politics. When she wrote John Quincy in the Spring of 1796 that

> [h]owever brilliant a woman's talents . . . [she] ought never to shine at the expence of her Husband. Government of States and Kingdoms, . . . I am willing should be soley administerd by the lords of the creation. I should only contend for Domestick government,[75]

she was the Vice President's wife, on her way to becoming the second First Lady in the country's history. When she did become First lady, her endorsement of separate spheres was even stronger. "I will never consent to have our sex considered in an inferiour point of light. Let each planet shine in their own orbit. God and nature designd it so--if man is Lord, woman is Lordess--that is what I contend for."[76]

By end of her life, the reversal was complete. She had accepted her husband's "power behind the scenes" view of womanhood as the ideal. Since "[n]o man ever prospered in the world without the consent and cooperation of his wife," women should be given an education that would "qualify them for the useful and domestic duties of life." It was an

"indispensable requisite" for "every American wife" to "know how to regulate her family; how to govern her domestics, and train up her children." If she failed in her domestic duty, she was not a true woman. For the "all-wise Creator made woman an help-meet for man, and she who fails in these duties does not answer the end of her creation.[77]

The contradiction of Adams's endorsement of separate spheres as an elite politician's wife, and her reversal from feminist critique to natural sexual difference and preordained spheres begs explanation. Her "normal" statements on gender from the mid 1790s on should not be taken at face value, or abstracted from her earlier struggle for woman citizenship, but rather seen as contradicting and reversing an earlier "feminist" strategy that failed to win support from either her husband or her friend Mercy Warren. At the same time that Adams became disillusioned with the concept of republican virtue, she also gave up her virtuous, but losing battle on behalf of womankind. Adams switched strategies, trading her feminist protest in for the individual privileges that she alone would enjoy as the wife of an elite and rising politician, who at least paid lip-service to separate spheres ideology. In practice, Adams was actively involved in political discourse with male politicians, and suffered little or no bars to her political expression, once she dropped her feminist critique and identified with the dominant male point of view of her time.

B. The Benefits of Individual Talent and Privilege

As Adams abandoned her feminist critique of the state and began to play the supportive role that John had recommended to her, her individual reputation and access to political information gradually ascended. This transition from feminism to individualism was made easier both by her cleverness as a an observer and writer of politics, and as the wife of an elite politician who enjoyed his political connections. Abigail Adams's depictions of battles, troops, and popular reactions during the War became essential to John Adams, who expressed his reliance on them. "You take it for granted that I have particular Intelligence of every Thing from others. But I have not. . . . I have more particulars from you than any one else. Pray keep me constantly informed, what ships are in the Harbour and what Fortifications are going on."[78] He wrote his cousin Mary Palmer that Abigail obliged him "with clearer and fuller intelligence" than he could get "from a whole committee of Gentlemen."[79]

John Thaxter, Adams's protege, also kept up his correspondence with Mrs. Adams in the early 1780s, omitting "no opportunity in writing" her because he was "too sincere an admirer of every trait of . . . [her] Pen, which never fails of Instruction or Improvement . . . ."[80] And after Mrs. Adams and her daughter joined Mr. Adams in London in 1784, she carried on a correspondence with Thomas Jefferson, on which he also came to rely for information. "You refered me to Mr. Adams for news; but he gives me none; so that I hope you will be so good as to keep that office in your own hands. I get little from any other quarter since the derangement of the French packets."[81] It was not just that she offered him political details that her husband omitted, but that her opinions and predictions were usually well-founded; thus Jefferson actually preferred to hear the news from her rather than either John Adams or Colonel Smith.[82]

Political men loved Abigail's letters, and she used them as a bridge to the public

realm that was not attained through woman suffrage. "Continue to write by every opportunity," was the request that prompted Thaxter to express his commitment to correspondence with Mrs. Adams in 1778. "I love to know what is passing in the world tho excluded from it."[83] This abandonment of the cause of women as a group and acceptance of individual privilege allowed her to reconcile her exclusion from the franchise and continue to express her political acumen. Mrs. Adams observed and discussed the race for Massachusetts Governor in 1780 as if she had the right to vote. "The man who from Merrit, fortune and abilities ought to be our Chief is not popular, and tho he will have the votes of the sensible judicious part of the State, he will be more than out Numberd by the lovers of the tinkeling cymball," Her man of merit was James Bodoin; the tinkeling cymball, John Hancock. Aware of the irony of following elections as a woman, she exclaimed to her husband, "What a politician you have made of me?" If I cannot be a voter upon this occasion, I will be a writer of votes. I can do something that way but fear I shall have the mortification of a defeat."[84]

In the same spirit of assimilation, Mrs. Adams renounced any ambition for herself, and proclaimed her assumption of the republican wife role. "For myself I have little ambition or pride--for my Husband I freely own I have much." She dreamed of a simple, virtuous life with John in their "rustick cottage" where "Goodness honour Harmony and Love--Retirement rural quiet Friendship Books--ease and alternate Labour--usefull life--progressive Virtue, and approveing Heaven" would yield all that she could wish for. But since the Revolution had "disturbed this peacefull tranquility" and called forth her husband as "a principal actor upon the Stage," her ambition was for his character--that he should "do Honour to his country whilst he secures it to Freedom, independence, and fame."[85]

V. Abigail Adams's Assimilation to Federalism

Adams's shift within the category "woman" accommodated her assimilation into Federalism. Once she chose to abandon her feminist and antislavery sentiments and identify with her husband's career, her major objections to the modern state and the hierarchy of federalism were gone. Adams's identification with the Federalist party was clear from her stances on political issues from the late 1780s until the early 1800s. She opposed the democratic uprisings and movements, such as Shay's rebellion, denounced the Jeffersonian republicans as "Jacobins," defended hierarchical order and obedience in the citizenry, and hawkishly supported Britain in its struggle against France. She showed unwavering support for the Sedition Act, and finally, espoused the Federalist view of the constitutional separation of powers, as well as the new doctrine of judicial review.

Abigail Adams began to identify with conservatives in the wake of Shays' Rebellion. In 1786 Daniel Shays and other farmers in western Massachusetts suffering from the economic crisis blocked the entrances of courthouses in protest of the legislature's failure to relieve their debt and distress. Adams, now in England with her husband, wrote Thomas Jefferson, then in France, about the "tumult" of "[i]gnorant, wrestles desperadoes, without conscience or principals. . . ."

In her view Shays had led a "deluded multitude" to pretend grievances which had "no existence but in their imaginations." Their radically democratic pleas for the issue of paper

money, the annihilation of all debts, and an equal distribution of property, along with the complaint that the Senate was "a useless Branch of Government" necessitated the "wisest and most vigorous measures to quell and suppress it." Adams assumed that Jefferson, as one of the few "sensible and judicious" persons, would agree that these "mobish insurgents" were sapping the foundation of their liberties. For her it was simply a matter of the "lower order of the community" who were "prest for taxes," but were unable to part with their land to pay them, and those who "possest money" were too afraid to lend it to them.[86] Jefferson responded in disagreement. He supported the "spirit of resistance" as the true foundation of liberty. "I wish it always to be kept alive. It will often be exercised when wrong, but better so than not to be exercised at all. I like a little rebellion now and then."[87] Thus as early as 1787, Adams was involved in a political debate over the meaning of liberty that would eventually come to delineate the boundary that separated the Federalists from the Republicans in the first party division. This party division would remove her husband from the presidency, and replace him with Thomas Jefferson himself in 1800.

In 1789, as the wife of the Vice-President, Adams began conscientiously to identify herself as a Federalist, in opposition to Antifederalists such as Elbridge Gerry and her old friends Mercy and James Warren. Adams wrote her sister Mary Cranch, ". . . there is not a member [of Congress] whose sentiments clash more with my Ideas of things than Mr. G[err]y." Gerry failed to "comprehend the Great National System which must Render us respectable abroad & energetick at Home. . . ."[88] Adams, like other Federalists, favored the centralization of power through the controversial Hamiltonian finance system and the federal adoption of state debts.[89]

After she discovered Mercy and James Warren's antifederalism and their sympathetic stance toward Shay's rebellion, she drove a wedge between herself and them, now ridiculing "a certain lady" for the audacity to ask the Vice President to consider her husband and sons for positions in the federal government. Adams chastised Warren for her "ambition," and hoped that "her pretentions & those of her Family" would fail to win favor with the ruling party, since whatever their contributions, James and Mercy Warren were "jealous" antifederalist "partizans." Adams suspected "a constant correspondence" was "kept up between Mrs. W[arre]n and Mr. G[err]y," and feared they conspired to "disturb the Government."[90] Thus the wedge between Mercy Warren and Abigail Adams signalled both women's complete identification with masculine parties, which obliterated whatever connections they may have shared as family friends, patriots, and political allies on elevating the status of womanhood from the abuses of Lord Chesterfield.

The conservative Mrs. Vice President censured the emerging Democratic-republican party for their "cry of the rights of man, liberty and equality. . . ." Her blind commitment to protect John's reputation threatened the dispassionate rationality that she so praised in her lecture to John Quincy during the Revolution. Instead of challenging the underlying philosophy of the Republicans, she criticized them for representing "the Vice- President as inimical to them, and as a man whose object was to introduce a government of Kings, Lords and Commons and a hereditary nobility."[91] As First Lady Mrs. Adams continued to defend her husband's opposition to the French Revolution, referring to supporters of French Revolutionary principles as "Jacobins." The Democratic-republicans continued to libel the President, calling him a "monarchist" for his pro-British sympathies and readiness to defend

the British militarily.

This calumny infuriated the First Lady, whose political energies were now completely devoted to the protection of her husband's honor. During the XYZ affair, Adams defended her husband's choice of envoys to France against Republican opposition, and was delighted that the papers of the failed reconciliation were exposed, proving the hostility of Talleyrand toward the American diplomats. Republicans had criticized President Adams for choosing Federalists envoys who were obviously hostile to the French, and thus unlikely to secure a reconciliation with them. But the exposed papers preserved her husband's reputation against attack, and validated Abigail's claim that the envoys were "honorable," "truly American" and "professional."[92] The First Lady's concern for her husband's reputation colored her interpretations of other major political contests, such as the Hamiltonian finance system, the Foreign Intercourse Bill, and the Sedition Act.[93] Excepting the Sedition Act, Adams expressed these contests as battles over John's reputation and power rather than serious debates over the meaning of republicanism in the early national period.

First Lady Adams now separated herself from her long-time friend Mercy Warren by politics and political philosophy. Mercy Warren retained a classically republican philosophy, in which virtue was defined through active participation in government, and corruption through the centralization of power and emasculation of male citizenship. The First Lady assimilated to the modern republican outlook put forth by the Federalists. No longer defining virtue through male courage and penetration in the public realm, Abigail Adams now expected the lower orders and the opposition to behave passively and obey established power. The "corruption of morals" was no longer a potential problem for every man, but was now defined through the passionate disobedience, insubordination, and opposition of the Democratic-republicans.[94] By the end of John's presidency, individual liberty was practically dropped from her vocabulary, as national interest and national self-defense against domestic insurgents became her political obsession.

This obsession led her to greater conservatism. When the French privateers began to capture unarmed American ships in 1795, Adams was actually more in favor of an American war with France than her husband. President Adams was squeezed between the opposition of the Republicans on one side, and the demands of General Washington and his chosen second, Alexander Hamilton, on the other. In 1799 after Adams decided to reconcile the hostilities by sending a minister plenipotentiary to France, he wrote his then ill wife that the Hamiltonians missed her because she was more hawkish than the President. "I have instituted a new mission, which is kept in the dark, but when it comes to be understood it will be approved. O how they lament Mrs. Adams's absence! She is a good counsellor! If she had been here Murray would never have been named nor his mission instituted! This ought to gratify your vanity enough to cure you."[95]

Adams's nationalism was also demonstrated by her eager support for the Sedition Act. While the Republican presses told lies about President Adams, and the Federalist presses told lies about Vice-President Jefferson, the Sedition Act was used to suppress only calumnious Republicans.[96] The Federalist Administration brought fifteen indictments under the Act, ten of which resulted in conviction and government. The conviction and imprisonment of James Callender was particularly important to Mrs. Adams, for when President Jefferson released Callender from custody, she regarded the gesture as a severance of the bond of their former

friendship. Adams blamed Jefferson for having practiced the "blackest calumny" and "foulest falsehoods" to defame her husband and win the election. And then, once in office, he liberated the "wretch" who was suffering the just punishment for his crimes in writing and publishing the "basest libel" and "vilest Slander which malice could invent . . . against the Character and reputation of your predecessor, of him for whom you profest the highest esteem and Friendship, and whom you certainly knew incapable of such complicated baseness."

In Adams's opinion, President Jefferson's release of Callender signalled the downfall of the republic. Letting Callender go was "a public approbation of his conduct." The Chief Magistrate had corrupted himself by permitting his "public conduct to be influenced by private resentment." In releasing the liar from his sense of shame--"the last restraint of vice"--President Jefferson set a bad example "upon the manners and morals of the community," opening the floodgates for vice throughout the nation. Thus, in addition to "stabbing" her with this "personal injury," he had contributed to the degeneration of the republic.[97]

Jefferson defended himself to Mrs. Adams by claiming to have "discharged every person under punishment or prosecution under the Sedition Law," which was "a nullity as absolute and palpable as if Congress had ordered us to fall down to worship a golden image." For Jefferson the law was unconstitutional because it coerced the people to worship their government officials almost religiously, and thus violated their right to free expression. It was the law, not the person, that received his attention. His motivation was not to reward slander but to "inspire ordinary charities to objects of distress, meritorious or not," and fulfill his "obligation . . . to protect the constitution," which was "violated by an unauthorized act of Congress."[98]

Mrs. Adams accepted his good intentions, but not his constitutional theory. Jefferson's mistake was to assume that the president held the power to invalidate a law on the basis of unconstitutionality. "[D]ifferent persons entertain different opinions respecting [the law]. It lies not with me to decide upon its validity, that I presume devolved upon the Supreem Judges of the Nation . . . ." Like other Federalists, Mrs. Adams accepted Justice Marshall's theory of judicial review articulated in Marbury v. Madison (1803). Further, the separation of powers required that "the power which makes a Law, is alone competent to the repeal." For if "a Chief Magistrate can by his will annul a Law, where is the difference between a republican, and a despotic Government?" Mrs. Adams's federalism was never far from her concern for her husband's reputation, and perhaps flowed from it.

The Sedition Act was lawful in her view because all civilized nations had agreed that "some restraint should be lain upon the asassin, who stabs reputation." Mrs. Adams's supported the Sedition Law with a "law and order" claim that if the injured could not resort to the law for reparation, then every man would "become the judge and avenger of his own wrongs," and the "sword and pistol" would decide the contest. Once injured men like her husband began retaliating outside the law, then society would become ungovernable. "All the Christian and social virtues will be banished from the land."[99] The real injury, however, was more personal than constitutional. Mrs. Adams's overriding concern was for her husband's reputation rather than legal principles. For she also defended her husband's midnight appointments of Federalists before leaving office, and criticized Jefferson for

removing John Quincy from his Federal appointment.[100]

Jefferson did Adams the courtesy of engaging in debate with her on the constitutionality of his repeal of the Sedition Act. He defended a constitutional theory that granted the presidency the power to declare the acts invalid, in contradistinction to the derived power of judicial review. "You seem to think it devolved upon the judges to decide on the validity of the sedition law. But nothing in the constitution has given them a right to decide for the executive, more than to the Executive to decide for them." Jefferson held that judges had the constitutional obligation to issue fines and imprisonments according to acts of Congress, but the president "was bound to remit the execution" of a law he considered unconstitutional. This distribution of power made the presidency and judiciary "check" each other; whereas "the opinion which gives to the judges the right to decide what laws are constitutional, and what not, . . . would make the judiciary a despotic branch."

Furthermore, though the United States Congress could make no law abridging the freedom of the press, the "power to do that is fully possessed by the state legislatures."[101] Adams could not agree. She continued to defend the Federalist policy on the grounds of national self-defense. To her it was a republican perversion to suppose that "the constitution ever meant to withhold from the National Government the power of self-defense, or that it could be considered an infringement of the Liberty of the Press, to punish the licentiousness of it."[102] Clearly Adams feared the loss of governmental power, not the loss of liberty in the citizenry.

In the realm of masculine politics, then, Abigail Adams had made the shift from revolutionary, neo-classical republicanism to modern Federalism. If Adams was a "liberal" during the Revolution, believing in equal liberty and protections of individual rights against governmental power, she was no longer. Rather she was a modern republican who still retained the paradigm of virtue and corruption in her political vocabulary, but redefined the terms during the "conservative revolution" of the Founding, as John Pocock and Russell Hanson have argued concerning the basis of male Federalist thought.[103]

Conclusion

Abigail Adams was a radical republican and feminist during the early part of the American revolution. After the Founding of the Constitution, she was a conservative republican. How did this happen? As I have shown, Adams actively participated in the Revolutionary cause. She assumed the responsibilities that her husband had abandoned at home in her role as deputy husband, kept John constantly informed of local political news, and identified her domestic work and personal sacrifices as public virtues. This independence and expansion of her identity fostered her feminist critique of the modern state as she anticipated its arrival, as early as 1776. She proposed the dismantlement of coverture through legal change, including female suffrage, without which, she threatened to "foment a rebellion," as the patriots had done against the absolute tyranny of the British. She also proposed a system of female "ingenious" education to eradicate the intellectual distinction between parents, and to improve the women's capacity to contribute to the state as mothers of future citizens and statesmen. She recognized that the denial of woman citizenship and equal educational rights was a testimony to male tyranny, but did not push the point further

with her husband, who had already failed to be receptive to her ideas on woman citizenship.

After being ridiculed and refused by her husband, Abigail Adams dropped her feminist challenges. She began to defer to John's ideas about the power of women in the private realm, and to accede to the ideology of separate spheres. Even as she did this, she recognized that the concept of virtue discriminated against women's contributions to the public welfare and became disillusioned. One of her coping methods was to turn her depression toward her femaleness, and subscribe to woman's "natural" misery. The other coping method was to drop her feminist criticism and proposals, and make her husband's political career her own. Thus Abigail Adams became a right-wing Federalist. She defended all the actions of her husband's administration, feared the uprisings of the masses, and disdained Democratic-republican opposition. In her identity as a conservative Federalist, she enjoyed common political expression with powerful men.

These coping methods served Mrs. Adams well. Whatever loss she may have felt in the denial of woman citizenship and the lack of support from both her husband and Mercy Warren, she was compensated by the honor and advantages that she received in partnership with a man on the road to the presidency. As First Lady, Mrs. Adams could now refer to the franchise and women's exclusion from it with levity, while endorsing the ideology of separate spheres. "Present my compliment[s] to Mr. Whitman," she wrote her sister Mary, "& tell him if our State constitution had been equally liberal with that of new Jersey and admitted the females to a vote, I should certainly have exercised it in his behalf."[104] During the same period, she wrote her son that "[h]owever brilliant a woman's talents may be, she ought never to shine at the expence of her Husband. Government of States and Kingdom, tho' God knows badly enough managed, I am willing should be solely administered by the lords of the creation. I should only contend for Domestic government, and think that best administered by the female."[105] She also contended that the separate spheres were "equal." Let each planet shine in their own orbit. God and nature designd it so--if man is Lord, woman is Lordess--that is what I contend for."[106]

Abigail Adams had made a trade, and profited from it as an individual. She received the approval of her husband and the larger society, and enjoyed many fruits of office, in particular the education and information she received by being in close proximity to politicians. Her letters from 1789 to 1800 demonstrated her improved spelling, grammar, and perspicuity, despite her interest to protect her husband. In addition to the information she received from her husband, she entertained and exchanged information with other politicians while her husband was in office. It was common for her to report to her sister Mary days in which she was visited by thirty to a hundred persons, including "Ladies of Foreign Ministers and the Ministers, with our own Secretaries & Ladies" and "the whole Levee . . . of senate & house," and strangers as well.[107]

Aside from the educational privileges she received in identification with her husband's political concerns she clearly exercised some influence in national policy. As Joan Hoff has noted, Adams engineered the crucial loan that John acquired for the United States from Holland in 1788 through her suggestion to Thomas Jefferson that he cooperate with her husband to secure it.[108] Certainly President Adams considered her views with respect to the hostilities toward France and a sedition policy. We also know that her one regret in leaving office in 1800 was that she lost the power to execute her political ideas. One of the

principal pleasures of her life was to "do good according to my ability with the means indulged in me;" her "sole regret" as it concerned herself, was that "those means will in future be so greatly curtailed, and limited . . . ."[109] Thus Adams lost the power she held informally as First Lady when she left office and "commenced" her "operation of dairywoman." Over the long view, she traded her failing struggle for women's rights in exchange for a complicity to modern patriarchy that would profit her as an individual. The education, influence, and notoriety that Abigail Adams enjoyed in her identification with her husband and Federalism obviously outweighed the hostility, resistance, and marginalization that she would have suffered had she chosen to maintain her disagreement with her husband and fight for woman citizenship.

27. The phrase comes from Diane Rubenstein's "Psychoanalysis and the Presidency," a paper delivered at the 1993 Midwest Political Science Association Annual Meeting, p. 13. Rubenstein explains that first ladies (like other women) often disavow male lack and confer the phallic sufficiency of their husbands like Donna Reed in the movie "It's a wonderful life."

28. Carole Pateman has defined modern patriarchy as the system of male dominance that ensues in bourgeois republics, replacing monarchical patriarchy. Instead of all subjects being subjected to the dominance of the father king of monarchical systems (classic patriarchy), in modern patriarchy the "sons" of liberty metaphorically cut off the king's head and share power equally amongst themselves. Women become subjected to the domination not only of their husbands and fathers who maintained patriarchal authority in the family, but to the male state as well. See Carole Pateman, The Sexual Contract, Chapter 4. Stanford: Stanford University Press, 1988.

ABSTRACT

Understanding bureaucratic control and adaptation has become a pivotal topic in the study of decision making and institutional control over the past decade. Yet agency theory has, with a few limited exceptions, been used to describe bureaucratic adaptation and responsiveness to a restricted principal or set of stimuli on a piecemeal, case by case basis and separate from more traditional interest group theory about political responsiveness and accountability. To work toward a more general, inclusive theory of agency responsiveness, this paper attempts to pull together the common findings of these cases to establish a general theory of principal-agent relationships existing in the federal bureaucracy as constrained by political and organizational context. Our research compares the stimuli of two independent government institutions, the Environmental Protection Agency (EPA) and the National Labor Relations Board (NLRB) with a particular emphasis on the role of organized interests in determining the level of agent responsiveness to principal cues.

We found that regional office staff in the NLRB and the EPA are strikingly similar in their ability to pursue formal and informal principals' goals. While structure does not seem to determine the success of formal principals, it can affect the coping strategies which agents use to reduce the pressure of informal principals for less regulation. Regardless of whether the interests or the agency initiates the enforcement action, responsiveness occurs irrespective of whether the organized interests are formal clients or affected interests. Finally, issue salience skews this balance of influence toward those interests which are particularly affected by enforcement outcomes.

HIERARCHICAL MODELS OF DECISION MAKING IN THE EPA AND THE NLRB: TOWARDS A THEORY OF AGENCY RESPONSIVENESS TO POLITICAL PRESSURE

Understanding bureaucratic control and adaptation has become a pivotal topic in the study of decision making and institutional control over the past decade. Much of the current research has focused on agency theory, and in particular, institutional constraints and incentives designed to promote responsiveness within the American federal bureaucracy (see McCubbins et al. 1987; McCubbins and Page 1986; Moe 1985; Schmidt 1993b; Scholz et al. 1991; Weingast and Moran 1983; Wood 1992). Yet agency theory has, with a few limited exceptions, been used to describe bureaucratic adaptation and responsiveness to a restricted principal or set of stimuli on a piecemeal, case by case basis and separate from more traditional interest group theory about political responsiveness and accountability. In particular, most studies ignore the influence of countervailing power in determining decision outcomes (McFarland 1992; Moe 1982; Sabatier 1992; Wood and Waterman 1991).

To work toward a more general, inclusive theory of agency responsiveness, this paper attempts to pull together the common findings of these cases to establish a general theory of principal-agent relationships existing in the federal bureaucracy. Our research compares the stimuli of two independent government institutions, the Environmental Protection Agency (EPA) and the National Labor Relations Board (NLRB) with a particular emphasis on the role of organized interests in determining the level of agent responsiveness to principal cues.

Our plan is to first, provide a limited critique of agency studies emphasizing the problems of generalizability. Second, we will identify the points of congruence and divergence which provide us with both theoretical tenets and limits to constructing a general theory. Third, we will provide a formal model of hierarchical decision making and agency responsiveness to political pressure. Fourth, we will provide limited, preliminary evidence of the validity of our model using studies of the NLRB and EPA. Finally, we will address our goals for future development of our theory.

Past Research

In an excellent but brief review of past studies of bureaucratic adaptation, Wood and Waterman (1993) argue that studies of bureaucracy often take simplistic views of bureaucratic responsiveness and adaptation. Such simplistic views lead to an underestimation of the stimuli creating incentives for responsive behavior. These scholars are particularly critical of past studies which focus only on presidential or congressional cues using static empirical methods without reflecting a wider range of special interest stimuli occurring within a multiple channel institutional arrangement.[1] According to Wood and Waterman, such studies ignore the complexity and dynamic nature of agency environment which influence the tone of bureaucratic relations. To address this, these scholars provided and tested an empirical model which includes congressional, presidential, judicial, and media pressure on EPA divisions. Their findings justify the inclusion of these variables and advance our understanding of political control within one agency.

---

[1]For example, see Moe 1982, 1985, Weingast and Moran, 1983, Chubb 1985, Scholz and Wei 1986, Wood 1988, 1991, 1992, Eisner and Meier 1990, Wood and Waterman 1991. We agree with Wood and Waterman that more sophisticated theory and new techniques are now needed to expand on the excellent foundation laid by these developmental but static approaches.

Yet, while Wood and Waterman's study confirms the validity and importance of agency environmental stimuli, their study is limited by its narrow applicability. By focusing on one high profile agency such as the EPA, the theoretical value of adding measures to control for the tone of bureaucratic relations is constrained to agencies similarly situated within the collective political consciousness. As part of the federal bureaucracy regulating externalities of industrial production affecting the safety of entire communities of people, EPA activities are salient to politicians, environmental activists, and reporters. Yet, because it is an independent agency with a single administrator, its relationship with the president, Congress and the judiciary is different than other types of agencies such as cabinet departments or independent commissions. It is not clear that their conclusions are necessarily applicable to other agencies like the NLRB which were institutionally designed as independent boards or commissions to depoliticize, rationalize, and remove from public view agency decisions which benefit high profile interests.

While we agree with Wood and Waterman's premise that contemporary studies of bureaucratic relations overemphasize institutional, informational, and behavioral constraints or patterns, we are not satisfied that their conclusions are generalizable to other agencies. We are especially concerned about the applicability of their model to agencies designed as independent commissions and which must respond to tone or context dynamics that are regionally determined. While Wood and Waterman include measures of congressional and media tone, EPA and the NLRB operate within an institutional structure where most of the work of regulating and administering policy occurs within a political culture that is regionally and locally determined.

Regional implementation of regulations in EPA and the NLRB has important implications concerning responsiveness for a number of reasons. First, decision making within these agencies is fragmented and localized. From authors with a variety of backgrounds and approaches, we know that this decentralization profoundly affects an organization's output by enabling and hindering rational decision making (Boschken 1988), by the filtering of decisions through different structural tiers (Hammond 1986), and by situating decision makers in proximity to different collections of constituents (Wilson 1989). Second, decision making in regionalized agencies is characterized by a high level of bargaining between units within the agency, competing organizations from other governmental units, and interests exterior to the agency (Ripley and Franklin 1986; Wilson 1989). Together, these two features of regionalized implementation ensure that incentives between principals and agents will be different than in highly centralized structures.

It can be empirically observed that substantial variation exists in the output of regional offices at both EPA (McKinney 1993a, 1993b) and the NLRB (Schmidt 1993a, 1993b, 1993c, 1993d, 1991, 1990a, 1990b, 1989). This variation cannot be explained entirely by the preferences of federal principals, administrative constraints, or task factors. We argue that the additional variation between regional offices is not random, but is in part a function of the preferences of regional officials and interests.

Moreover, the influence of these preferences is affected in systematic ways by the visibility of the problem addressed by the agency. Issue visibility affects both the way in which interests are organized and the incentives of politicians to monitor (Ripley and Franklin 1986; Wilson 1980; Wilson 1989). Both Ripley and Franklin and Wilson have developed well known

categorizations of policies and agencies based on these characteristics.[2] We find their categories to be a useful beginning point but limited with respect to predicting responsiveness. These broad classifications of agencies fail to account for substantial internal differences between programs and offices. Additionally, we find that agencies do not often fit neatly into a single category, but rather have some characteristics of several.

Instead of focusing on categorical differences between agencies, we argue that variation in the tone and contextual characteristics of decisions is critical for understanding the incentives which exist between principals, agents, related subunits, and constituents. Although we depart from the simplistic categorization of agencies, we believe the concepts of political and organizational context particularly with respect to regional characteristics are fundamental determinants of an agency's tone and context. The EPA and the NLRB provide an interesting comparison along these lines. Both rely on regionalized implementation with extensive interaction with local interests. Significantly, however, these two agencies have fundamentally different structures and approaches with the EPA responsible for the identification and initiation of regulatory action and the NLRB responsible for disposition of complaints filed by its clientele.

We amend Wood and Waterman's model to include measures of political culture and differential saliency while broadening the theory to control for and be sensitive to structural and institutional differences or goals existing within different components of federal bureaucracy. We do this by conducting a limited comparison between the EPA, an independent agency which regulates behavior affecting the general public, and the NLRB, an independent board which regulates the relationship between targeted groups. We will reserve an additional comparison including the two other components of the federal bureaucracy, executive departments and governmental corporations, for future study in a more expansive context.[3]

Our approach is consistent with normative and empirical studies of organized interests including contemporary studies showing differentials in agency responsiveness related to structure and public stature of organized interests. In particular, there are several notable studies which independently validate the importance of both political culture and the structure of organized interests to political outcomes. Moe's (1984, 1987) critical analysis of the organization of interests shows that visibility of groups, the structure of the arena that groups pluralize, the structure of their opposition, and the saliency of group goals influences governmental responsiveness. Huckfelt's (1986) study of political context shows convincingly that the political culture existing within a political actor's decision context influences and often constrains the range of information collected and processed in making decisions.

Further, Schmidt's studies (1993a) on public opinion and labor union effectiveness show that newsworthy union activities are associated with a decline in a supportive political culture for unions. In addition, Goldfield (1987) and Schmidt (1993a, 1993b, 1993c, 1993d, 1991, 1990a, 1990b, 1989) show that there is a clear and continuing state specific if not regional bias to the structure of NLRB decisions related to union organizing and protection from unfair labor practices. Finally, although Schlozman and Tierney (1986)

---

[2]Ripley and Franklin's classification of domestic policy includes the following categories: distributive, competitive regulatory, protective regulatory, and redistributive. Wilson's four classifications of policies include clientelism, interest group politics, majoritarianism, and entrepreneurialism.

[3]We are currently developing a text that examines all components of the federal bureaucracy in Models of Decision-Making in the Federal Bureaucracy.

have provided evidence that bureaucratic decisions often reflect the political climate or tone as well as institutional constraints on discretionary decision making, Sabatier's (1992) study of the responsiveness of tightly structured public organizations and special interests shows that the structure of the agency, the structure of organized interests, and the structure of public support influence how decisions are made in general.

These studies provide substantial support for our argument that an examination of agency adaptation and responsiveness within a principal-agent relationship must necessarily include an understanding of the strength and limitations of the structure of competing organized interests, and the climate of opinion existing within the political culture in which the agency staff interact. Yet, such interest group approaches fail to address a crucial limit to discretionary decision making in agencies. These studies fail to acknowledge what agency theorists have convincingly shown that responsive or strategic behavior is constrained by institutional structure (Hammond 1986). Agency theorists have demonstrated with case studies as well as with formal models that principals use punishments and rewards as incentives for their agents to minimize the opportunity for shirking or disregard for the principals' preferences (Bendor et al. 1987; Bendor and Moe 1985; Calvert et al. 1989; McCubbins et al. 1987; McCubbins and Page 1986).

Our argument accentuates the congruence between these seemingly disparate approaches by acknowledging, as agency theorists do, the importance of institutional constraints and the value of incentives while adapting Wood and Waterman's argument for controlling for the tone of bureaucratic relations and amending their argument to include the political context and structure of organized interests into the model. By broadening the examination of the environment in which agency staff interact, we expand the range of explainable agent behavior and can better understand how slippage occurs and why, even when it appears that agents are not responding consistently to principal cues, they are reasonably successful in administering policy within their environment. Importantly, by controlling for organizational structure and political context, we can better weigh the relative importance of each to different components of the federal bureaucracy.

A General Theory of Agency Responsiveness

In this section we specify the components of the general model of bureaucratic responsiveness to political pressure. Like the Wood and Waterman model, our model responds to both pressure from principals and pressure from clientele as top-down and bottom-up forces. We operationalize some of the stimuli differently to provide comparative models for the EPA and the NLRB and to address the structural constraints on decision making at the field level of these institutions. We first address important determinants existing within the structure of the agency. Next we examine the effect of political context on agency decision making.

Structure of Agencies: Responsiveness to political direction occurs not in accordance with a single principal's preferences or cues but to multiple principals and pressures. Unlike executive departments which are subject to presidential control through appointees and routine congressional oversight occurring as a by-product of the budgetary process, other bureaucratic structures have less formal relationships with congressional principals. In particular, institutional structures such as those found in the NLRB are subject to presidential control through appointees but not to routine congressional oversight. Congressional oversight on these kinds of bureaucratic institutions are often a result of "fire alarm" oversight activity (McCubbins and Schwartz 1984). Other structures such as those found in the EPA are subject to ongoing control through presidential appointees and congressional oversight based on "police patrol" activities by members and committees of Congress.

Aside from the formal relationship with the president and Congress, decisions often reflect responsiveness to other pressures occurring within the filtering and processing of decisions through the structure of the agency. For example, in the NLRB, the sources of pressure on regional staff are the national office board members, the General Council, administrative law judges, employers, unions and public opinion. At EPA, similar sources of pressure on regional staff come from the national office, state officials, administrative law judges, industry, environmental groups, and public opinion. The joint pressures from formal principals (top-down) and informal principals (bottom-up) create a dynamic environment in which numerous principals compete for agency attention to their preferences.

This is particularly characteristic of tall or decentralized agencies. More complex institutional structures increase the distance between formal principals and their agents. The greater number of clearances required the more uncertainty will be generated in determining the fit between formal principals' preferences and agency output. More importantly, this distance and the dilution of the incentive structure between formal principals and agents creates more opportunity and locations for clientele as informal principals to access field office staff.

The structure of responses to formal and informal principals is generally determined by opportunities within the institutional filtering process to stall, respond, or make non-decisions either proactively or reactively. Within the NLRB, there is ample opportunity to respond, stall, or make non-decisions such as urging withdrawal. The NLRB, however, can only react to complaints; it cannot initiate a case. The EPA has similar decision making opportunities, but its structure dictates a proactive approach whereby EPA officials initiate enforcement actions.

Structure of Political Context: Political context is composed of both event driven public opinion as well as traditional sympathies and preferred policy outputs. Each state and region of the U.S. has its own political culture concerning labor relations and environmental protection. In particular, when the state or regional political culture is supportive of unions or environmental protection, respectively, pro-union or pro-environment decisions by the agencies are received more positively than pro-industry decisions. As such, traditional sympathies create work or decision environments for agencies which comprise a continuum of hostile to supportive political cultures for their decisions.

Yet, it is difficult to discuss political culture in isolation from the relative strength of competing organized political interests within a policy domain.[4] For example, at the NLRB, the countervailing powers are stable and narrowly focused on two peak associations -- unions and employers. In contrast, the countervailing powers at the EPA are not narrowly focused. The opposing forces, broadly defined as industry versus environmentalists, are fragmented and tend to shift depending on the issue context. The structure of interests within the policy domain is critical for understanding the way in which political context shapes decision making at an agency.

Within this context, then, the magnitude of political conflict between competing interests often determines the level and frequency of variation in decision outputs from the preferences of the national principals. Where conflict is low and decisions favor principal preferences, there is little incentive for principals to monitor agent decisions. Where conflict is low but agency decisions reflect capture, monitoring and oversight become the main mechanisms for control. Where conflict is high but agency decisions favor

---

[4]For further discussion of policy domains and peak associations, see Salisbury (1992) and Salisbury et al. (1987).

principal preferences, agencies may continue to seek principal support to justify their decisions and reduce the uncertainty existing in their environments. Where conflict is high and decisions do not reflect preferences of the principal, the principal must engage more than simple monitoring to be successful but may withdraw responsibilities or use other mechanisms to punish the agency.

While the existence of political conflict, by itself, is rarely enough to create pressure which competes with principal goals, the level of the political conflict and the congruence between a principal's preferred outcome and the actual outcome influence how much monitoring and oversight field staff can expect from upper levels of the institutional hierarchy. Importantly, the range of interests involved and the institutional constraints for remedial decision making influence how critical reviews by principals are perceived. Whereas some decisions in the NLRB are non-reviewable, all decisions made in the EPA can be reviewed and reversed by political or judicial actors outside institutional hierarchy.

More intense scrutiny of agency decisions often occurs when political conflict expands to the public level (Schattschneider 1975). Often, the visibility of problems and issues under the direction of the agency determine support for agency decisions by formal and informal principals. Since the creation of the NLRB, labor relations are generally not public issues unless there is a high profile strike or contract negotiation. Conversely, environmental issues have become highly salient public issues and propagandized through state and regional campaigns for environmental consciousness. Because of this, the relative strength of public information and knowledge about what these agencies do, why they do it, and who they do it for influences the acceptability of their decision outputs.

Similarly, the perceived impact of agency decisions on the welfare of targeted clientele also affects the saliency of the problem. For example, at the NLRB pro-union decisions are often perceived as influencing industry profitability, while pro-industry decisions are often seen as adversely affecting unions' ability to protect workers welfare. With respect to EPA enforcement, industry perceives their economic welfare to be directly related to EPA actions with aggressive enforcement interfering with profits and creating financial distress. In both cases, decisions by the agencies are perceived as having the potential to create financial distress for individual firms resulting in employee layoffs that subsequently affect the economic health of the region.

A Provisional Test Using the NLRB and EPA

We examine our theory through a comparison of the NLRB and the EPA by explaining how the principal-agent relationship works in each institutional structure and identifying the key determinants of decisions. In particular, in each discussion we examine the range of interests, goals, and constraints involved in each agency's filtering process. In the final section, we will compare common determinants and important differences in the decision process.

Principal-Agent Theory and the NLRB

Structure of the NLRB: The NLRB was created to help curb labor strife by regulating labor-management relations. The Wagner Act 1935 guaranteed the right of workers to unionize and bargain collectively. In response to claims that the NLRB was biased against employers and gave undue advantage to unions, Congress granted rights to employers against unfair labor practices by unions in the Taft-Hartley Amendment (1947) to the Wagner Act. The NLRB's responsibility then became one of umpiring private disputes between labor and management (McClintock 1980).

The NLRB basically applies law and precedent to individual cases which have been recommended by the Regional Director of a regional office and the General Counsel of the NLRB; it cannot take independent action but must wait for a case to be filed and referred to it from its field offices. While the NLRB is composed of five members appointed by the president for six year terms, the General Counsel is the current president's appointee. The General Counsel determines whether a complaint has merit or not. The Regional Director is responsible for a large staff of field personnel, who have ample discretion, apply a range of personal, legal, political, and organizational criteria to determining merit in cases (Moe 1985).

As shown in Figure 1, once a complaint is filed at one of the board's regional offices, the staff at the regional office investigate and decide whether to dismiss the charge, recommend withdrawal, or to hold a hearing before an administrative law judge.

(FIGURE ONE ABOUT HERE)

If a case is granted a hearing, the judge then makes recommendations to the NLRB's General Counsel. This recommendation can be appealed to the Regional Director and finally to the NLRB (NLRB 1987). Thus, the NLRB is organizationally situated in a classic principal-agent relationship between itself, its General Counsel, and its regional offices.

Theoretically, for the NLRB to control the regional offices, it must have some leverage. It has some control over regional office budgets and organizational structure. Additionally, the NLRB could reverse regional office decisions or refuse appeals as ways of providing direction and rebuke to maverick offices. Implicit in the structure of the relationship is that decisions made by these regional offices are reflecting the precedent setting decisions of the Board. Given the existence of a relatively constant pro-labor coalition in the board, regional offices and their clientele could reasonably be expected to know which direction decisions would likely take at the national level.

By eliminating the pro-labor coalition in the NLRB, the Reagan administration created conditions under which regional decisions were being made with greater uncertainty than ever before. Hence, until 1980 there was substantial opportunity to exert some independence in the regional offices from the NLRB members' control. Regional Directors, field personnel, and clientele could be reasonably sure about which claims would be accepted and calculate an expected outcome.

As such, the NLRB's decision-making structure provides ample opportunity for regional offices to use considerations other than merit in deciding cases (Brownstone 1986-87; Cooke and Gautchi 1982; Delorme and Wood 1981). In the past ten years, however, there have been important changes which have led to speculation that the NLRB is exerting pressure on regional offices for pro-business decisions. Prior to the Reagan administration, presidents traditionally appointed members who met with approval of both labor and business interests, and reappointed such members. Such a departure introduces unknown members as well as uncertainty and influences the ability of claimants to plan a board strategy. Most importantly, from 1961 to 1980, regardless of which party controlled the presidency or the legislative controversy occurring at the time, there was always a pro-labor coalition existing in the board. Yet during the Reagan administration, from 1981-1985, not only was the pro-labor coalition dismantled, but Democrats were excluded from the board altogether (Schmidt 1993a, 1991, 1990a, 1989).

Besides changes in tradition and precedent, regional decisions can be influenced by changes in the offices' organizational environment due to strategic behavior by clientele. Most specifically, regional office caseload

has an important effect on the NLRB's ability to provide direction to its regional staff (Moe 1985). Studies have shown that the greater the relative tendency of labor to file cases, the less pro-labor are the staff's filtering decisions (Moe 1985; Delorme et al. 1981). Dismissals of union claims, then, may be a result of increased workload rather than adherence to NLRB criteria.

Political Context: At the national level, labor and business, as bipolar groups and the sole clientele of the NLRB, are stable, focused, and competitive. Regionally, however, this is not always true. In some states, both labor and business are quite fragmented; most frequently there is one dominant force and often that is business. The relative influence of each group is often determined by the nature of the political context in which they compete. Numerous components of this political context include stable cultural attributes as well as event driven forces derived from economic distress and issue saliency. More specifically, these forces and attributes include historical patterns of hostility toward unions, the level of unemployment as a measure of industrial financial distress, and the scope of the conflict as measured by the number of strikes.

Individual regional offices operate in very different types of political environments, some of which are hostile to unions and some of which are supportive to unions. Within the loose organizational structure of the NLRB, it is possible for one type of case to be routinely dismissed by one regional office, whereas the same type of case may be granted a hearing in another regional office. This variance may be a response to the political strength of the claimant within the region or state. For example, the Southern and Southwestern regions of the U.S. have been traditionally less fertile for union organizing and have the lowest areas of unionization (Goldfield 1987). Although the strength of Southerners' disapproval of unions, as measured by public opinion polls, has declined since the 1970's, Southerners still express the least support for unions (Schmidt 1993b, 1989).

Just as some areas have a historical pattern of hostility toward unions, other areas have historical and intermittent patterns of industrial distress. This stress increases the saliency of NLRB decisions for industry so that they pressure for outcomes which do not create more financial hardships or industry layoffs. Conversely, unions pressure for outcomes which protect them from employer activities designed to reduce membership, benefits, and jobs. For example, some studies have shown that increases in unemployment tend to increase the leniency of decisions by regional staff. In contrast, other studies have shown that labor unions are less likely to file complaints during periods of high or rising unemployment because they are usually in a weaker bargaining position in those periods (Moe 1985; Delorme et al. 1981).

Bargaining strength is important because the board reviews only those cases which have been processed by regional staff. It is possible that cases sent to the NLRB for review are those originating from regions where the labor and business interests are unevenly matched in political or economic strength. This suggests that the likelihood of a labor complaint against an employer in a strong union area being recommended to the board for review is higher when the board is dominated by Democrats than it would be if the board were dominated by Republicans. Given that this type of decision-making constraint exists for some regional offices and not for others, this suggests that the comparative strength of labor to industry within the political context creates varying incentives for responsiveness to formal and informal principals in regional NLRB offices.

Thus, we expect that regional variance in the relative leniency or aggressiveness in investigating union or industry complaints are a result of structural and contextual forces. Regional office staff are cross-pressured between formal and informal principals determined by the organizational structure of the NLRB. The relative influence of these principals is affected

by the nature of the political context in which decisions are made.

Empirical Evidence: We used cross-sectional time series regression analysis to examine the relative weights of changes in the political composition of the board, economic welfare, clientele strength, regional culture, and organizational forces on regional office decisions on unfair labor practices. We used an NLRB data set concerning union complaints against business because that is clearly where the most cases are filed and reflect the original intent of Congress in establishing the NLRB.[5] These data were taken from the NLRB's unpublished master data files on Unfair Labor Practices. This master data file contains 658,623 cases completed in regional offices from 1964 to 1986.[6] This time period begins four years after the last amendment to the Wagner Act in 1959, and after a change in presidential administrations and General Council. Because there is limited comparable state data, we use only eleven years of data between 1964 and 1982.[7]

To more fully grasp the importance of bias and union access to remedial action by the board, we examined the ratio of regional office dismissals of union complaints to all complaints filed and closed. Because the filtering process is so important to achieving standing for remedial action and perhaps subsequent board review, the rate of dismissals signals the willingness of the regional office to pursue problems of labor.

Thus, the model, using times series cross-sectional regression[8], will be identified as follows:

$$D_t = U_t + E_t - M_t - T_t + S_t + H_t + V_t + R_t + B_t$$

where:

D_t = percentage of union complaints dismissed
U_t = percentage of unemployment in the state
E_t = percentage of state employment in manufacturing
M_t = percentage of state union density
T_t = number of work stoppages per state
S_t = dummy variable for Southern anti-union states
H_t = dummy variable for high caseloads
V_t = percentage of state voting for U.S. House Democrats
R_t = dummy variable for Republican presidents
B_t = dummy variable for pro-labor coalition at board

The dependent variable is the ratio of union complaints dismissed to all

---

[5]Section 8A of the National Labor Relations Act prohibits coercive acts by an employer against employees, such as firing employees engaging in union activities. Section 8B of the Act on unfair labor practices defines which activities by unions are illegal, such as secondary boycotts. Unions file under Section 8A and employers file under Section 8B (NLRB 1987).

[6]Although other studies of decision making in the NLRB contain earlier data, it is not possible at this time to extend the data to match those same time periods. The NLRB unpublished master file only contains reliable data from 1964 to 1986.

[7]These years include 1964, 1966, 1968, 1970, 1972, 1974, 1975, 1976, 1978, 1980, 1982.

[8]We used TSCSREG-Parks method in the SAS statistical package to estimate the NLRB model. This procedure corrects for Type II error structures by assuming a first-order autoregressive error structure with contemporaneous correlation between cross-sections and estimating the model using first two-stage least squares and then generalized least squares. See other applications of this procedure in Scholz and Wei 1986 and Wood 1992.

complaints for each office. The independent variables will control for the structural and political context of the decisions. We measure the strength of industry with the percentage of state employment in manufacturing, the strength of unions with the percentage of state union density, the regional salience of labor relations with the number of strikes per year in each state, and the financial distress of industry with the percentage of unemployment in each state.[9] We included binary dummy variables (0, 1, where 1 = the controlled characteristic and 0 is everything else) to control for shifts in decision making in response to the demise of the pro-labor coalition in the NLRB where 1 = the pro-labor coalition from the 1964-1980 period and where 1 = Republican administrations.[10] To control for caseload we sorted the data by regional office and by caseload[11] and created a binary dummy variable where 1 = offices with high caseloads. We measured regional influences with two variables. The first is a dummy variable with the traditional division between Sunbelt and other regions where 1 = the Sunbelt.[12] The second regional variable measures the percentage of the vote cast for Democratic U.S. House candidates in each state.[13] Support for Democratic candidates, given the long association of unions with the Democratic party, can be seen as a proxy for support for unions within each state. This variable should provide a closer approximation of state specific sympathies toward unions by providing a finer distinction between the political culture of the states.[14]

(TABLE ONE ABOUT HERE)

All the variables are significant except the variables which measured the Sunbelt as a distinctive political culture and the effect of high caseload on decision making. The political context variables have the strongest influence on dismissal rates while the structural variables are limited to the influence of formal principals.

The structural variables assessing the influence of formal principals are both highly significant. These include the influence of a pro-labor board and the pressure of Republican presidents who appointed Republican General Councils. In particular, the pro-labor board has one of the strongest influences outside of the impact of manufacturing employment. The pro-labor board variable is positive which means that the percentage of dismissals increases when there is a pro-labor board. This suggests that regional staff

---

[9]The unemployment data, manufacturing employment data, and labor force unionization rates were taken from the Bureau of Labor Statistics' Handbook. The labor force unionization rates are state level and for the private sector only. The state strike data were taken from the Bureau of Labor Statistics' Statistical Abstracts.

[10]The dummy variable for the pro-labor coalition dominance was constructed from data found in Schmidt (1989a).

[11]During the period from 1964 to 1986, high volume offices handled 25000 to 35000 cases, medium range office handled 15000 to 24000 cases, and low range office handled between 5000 to 14000 cases.

[12]These data were sorted according to the traditional divisions between northeastern and east central industrial states, the south, and western states. Finer distinctions between these states probably should be made after the mid-1970's due to the industrial shift from the Rustbelt to the sunbelt. Organizing efforts and attitudes have changed in the sunbelt over time. For most of the time period examined, however, these divisions represent a reasonable approximation of division between hostile and less hostile union environments.

[13]The election data were obtained from the Bureau of Labor Statistics' Statistical Abstracts.

[14]Although public opinion poll data measuring union support in each state would be preferable, such data do not exist for the comparable time periods used in this study. See Schmidt (1993b) for studies on public opinion polls regarding labor union support.

are confident in making decisions when there is relative certainty in board preferences. When Republican presidents changed the board membership, the dismissal rate dropped, indicating that regional staff were more uncertain about board preferences and less willing to dismiss cases.

Independently, the same pattern was observed relative to Republicans in the White House. When regional staff are certain of the president's preferences through the General Council, they dismiss more cases. Republican presidents and their General Councils have more clearly articulated their opposition to pursuing labor initiated cases. Thus, the pro-labor board and a Republican in the White House variables show that regional staff are both responsive to the implied preferences of the board and the explicit preferences of the president.

The final structural variable, caseload, does not work at all. Theoretically, and in other studies, high caseloads increase dismissals. In this model, caseload has no effect. This could be a result of controlling for regional office and state specific influences. Most high caseload offices exist in the north and where unions or industry are strong. Thus, it is not caseload that increases dismissal rates. Other influences such as a Republican president in the White House are important.

The political context variables are all highly significant except for that measuring the Sunbelt. Many scholars argue that there is a significant anti-union bias in the South. Goldfield (1987) has argued, however, that this bias has been diminishing or is now located in just specific sections of certain states. Schmidt (1993b) found that it was necessary to control for Southern anti-union bias when national level data were used to examine NLRB decisions. By analyzing state level data, the distinction of being in the Sunbelt is longer significant. This suggests that we need to examine particular state cultures that support or promote unionization within states.

As a finer measure of support for unions with the state, we used the percentage of the vote for Democratic House candidates in each state. The results show an inverse relationship between state level support for Democrats and regional dismissal rates. When Democratic support increases, the percentage of cases dismissed from that state decreases. This suggests that regional staff understand the close relationship established during the New Deal era and respond to the preferences defined by state culture. More specifically, when there is more Democratic sympathy in the state, regional staff are less inclined to dismiss cases and perhaps more inclined to either process them or urge unions to withdraw their complaints.

The variables which control for the relative strength of organized interests within the region are both significant in the hypothesized direction. The manufacturing employment variable as a proxy for the economic strength has the strongest impact on the percentage of cases dismissed. As the percent of population which is employed in manufacturing increases, the percentage of cases dismissed also increases. On the contrary, when a large percentage of the state population are union members, the percentage of cases dismissed decreases. These results show that both union and industry influence regional decision making. Such influence could create cross-pressure effects on regional staff when both industry and labor are strong competing forces. This data shows that it is a grossly unequal influence, however, because the manufacturing variable has a much larger influence than the state union membership variable.

Outside of the unequal power of the clientele, other contextual characteristics affect the relative success of these informal principals. Issue saliency or issue visibility determines the scope of the conflict and the level of responsiveness expected from regional staff. Our measures of issue saliency, strikes and unemployment, are both significant and influence

the dismissal of cases in the hypothesized direction. Unemployment, which is both an indicator of the welfare of workers as well as the welfare of industry, is positively related to increases in dismissal of cases. As was discussed earlier, when industry reaches a level of distress or unprofitability it begins to lay off workers. We argued that when there is high unemployment, regional staff are more likely to be lenient with industry than they would under full employment conditions. They are concerned about creating financial hardship for industry which may lead to layoffs. This suggests that regional staff are cognizant of the economic consequences of their decisions.

Yet, they also respond to union preferences as demonstrated by the inverse relationship between the number of strikes initiated in a state and the percentage of cases dismissed. Increases in the number of strikes, as a measure of the magnitude of the conflict between employers and employees, influence regional staff to take labor concerns more seriously. Regional staff are more reluctant to dismiss cases in states where workers have felt strongly enough about disputes with employers to risk personal financial hardship through strikes.

Thus, the key influences on regional staff decision making in the NLRB are both the formal and informal principals. Their relative influence is affected by regional characteristics which determine the nature of incentives to respond to one pressure over another in a given region. At the NLRB, we observed that the greatest influence on the variation in regional decisions occurs as a response to the distribution of interests and preferences. For unions to successfully compete with the influence of strong industry, they must have many members and the support of a pro-union culture, a sympathetic president, and a highly visible conflict with employers.

This test of our theory showed that when political culture, events, and formal principals support labor unions, regional staff are more reluctant to dismiss cases. When political culture, events, and formal principals are sympathetic to industry, regional staff are more likely to dismiss higher percentages of cases filed by unions against employers. If political culture, events, and formal principals present conflicting cues, regional staff will respond to the more dominant interest existing within the countervailing forces competing for influence. We will now turn to an evaluation of these same forces at the Environmental Protection Agency.

Principal-Agent Theory and the EPA

Structure of EPA: During the Nixon administration, EPA was created to coordinate a variety of existing and new environmental protection statutes through a regulatory process based on monitoring and enforcement. Beginning in the late seventies, the Toxic Substances Control Act of 1976 (TSCA) required EPA to coordinate regulatory activity related to the manufacture, distribution, and disposal of chemicals substances.[15] To enforce TSCA, policy makers in Washington write specific rules which are then directly enforced by officials in the ten regional offices.[16] The regions employ a variety of

---

[15]The act comprehensively includes all chemical substances except those in eight categories. Those excluded are pesticides, tobacco, nuclear material, firearms and ammunition, food, food additives, drugs, and cosmetics. All of these are regulated under other statutes.

[16]The distribution of the states among the regional offices is as follows: Region I - CT, ME, MA, NH, RI, VT; Region II - NJ, NY, PR, VI; Region III - DE, DC, MD, PA, VA, WV; Region IV - AL, FL, GA, KY, MS, NC, SC, TN; Region V - IL, IN, MI, MN, OH, WI; Region VI - AR, LA, NM, OK, TX; Region VII - IA, KS, MO, NE; Region VII - CO, MT, SD, UT, WY, Region IX - AZ, CA, HI, NV, TT; Region X - AK,

(continued...)

strategies to gain compliance from firms. These include self-monitoring reports filed by firms, random and scheduled inspections by EPA personnel, informal negotiations with violators, formal administrative actions, and federal civil and criminal cases.

In contrast with decision making at the NLRB, regional EPA personnel are responsible for determining if any action -- whether formal or informal -- is warranted on the part of the agency. As such, EPA inspectors and case processors determine both the presence of a violation and the agency's response, if any, to that violation. Informal actions include personal discussions between regional officials and firm representatives to develop methods and timetables to eliminate identified violations. If this is not productive, regional officials initiate formal measures which culminate in a formal administrative action.[17] Based on statutory guidelines, regional preferences, and headquarters preferences, these actions can be litigated through EPA's own administrative law judge process or through federal district courts. This process is outlined in Figure 2.

(FIGURE TWO ABOUT HERE)

In this analysis, we focus specifically on EPA enforcement of the TSCA program. While general guidelines are set through the program office in Washington, regional personnel have considerable discretion in making enforcement decisions about toxic substance violations. Although regional officials recommend cases for litigation through the federal district courts, headquarters lawyers as well as Department of Justice lawyers assume primary responsibility for these cases removing much discretion from regional offices. Formal administrative actions, however, are the primary gambit of regional officials. Hence, formal and informal principals should have the most opportunity to influence regional decision making with respect to decisions regarding the initiation of formal enforcement actions.

In fact, previous research indicates that EPA as a whole and in specific programs has been responsive to numerous formal principals. (Hoberg 1992; Lowry 1992; McKinney 1993b; Percival 1991; Vig and Kraft 1990; Wood and Waterman 1991; Wood 1992). Presidents have used the control of appointments and staff oversight to steer EPA in desired directions. Although Shimberg (1991) and Wood (1992) note that the influence of Congress has been limited by executive control and Congress' own inability to speak with a unified voice, numerous authors have found some consistent responsiveness on the part of EPA to the House and Senate (Hoberg 1992; Lazarus 1991; McKinney 1993b; Percival 1991; Vig and Kraft 1990). To ensure that its preferences are represented by EPA decisions, Congress has used fire alarm oversight, procedural guidelines, and specific legislative requirements. The U.S. federal courts have adopted a particularly activist approach to judicial decision making with respect to EPA, and EPA has shown much sensitivity to court concerns (Glicksman and Schroeder 1991; Hoberg 1992; Kenski 1990; Kovacic 1991; McGarity 1991; Melnick 1983; Tietenburg 1992).

As with the NLRB, the caseload of regional staff may affect their ability to initiate enforcement actions and balance competing preferences. Unlike the NLRB, however, EPA regional staff can control their caseload by initiating fewer formal administrative actions even when the magnitude of the problem great. For example, when large numbers of firms are in violation of

---

[16](...continued)
ID, OR, WA. While many EPA programs are implemented through joint relations of some kind with state agencies, Congress has given EPA primary implementation responsibility for TSCA which cannot be delegated to state agencies.

[17]In certain very severe violations, the statute allows for criminal prosecutions. These are difficult to establish and quite rare, comparatively.

TSCA regulations, it is possible for EPA regional staff to concentrate on only the most significant and visible violators as a strategy to manage their caseloads. In this situation, we should observe an inverse relationship between caseload and enforcement activity. Nonetheless, EPA behavior and responsiveness to the scope of the problem is scrutinized more closely by Congress and the president than such staff strategies at the NLRB. Because of this, we may observe more rigorous enforcement when the problem is more visible and caseloads are high.

Political Context: The visibility of the problem as well as other state specific characteristics help create a unique political context which constrains the way EPA regional staff make decisions in each state. The distinct political culture of each state with respect to environmental issues, the balance of power between competing organized interests, as well as the salience of environmental regulation to these interests are also components of this context. As we saw at the NLRB, these contextual forces create variance in the regional administration of EPA regulations.

Nationally, there is no unified political culture with respect to environmental policy, although there has been a general increase in the saliency of the environmental protection. Regionally, however, it is possible to identify significant variation in the political culture of local areas toward environmental protection. Unlike the NLRB, this is not a simple matter of identifying large regional blocks of the country. Rather, pro-environmental cultures exist in states as widely scattered as California and Rhode Island, and anti-environmental cultures exist in others such as Louisiana and Wyoming (Hall and Kerr 1991).

There has not been much empirical attention to the specific influence of EPA's clientele or other affected interests on decision making at the enforcement stage. In the TSCA program, the chemical industry is the target clientele of the regulation. In comparison to many other regulatory programs at EPA, this industry segment is relatively stable and narrow in terms of its preferences, although probably not to the extent of employers' interests at the NLRB. TSCA provides citizens and environmental interests very limited standing to sue EPA, but this provision is almost never utilized at the enforcement stage. Environmental interests are active in Washington at the rulemaking stage but exhibit little formal activity in the regions. Nonetheless, because local citizens and environmental interests may access legislators, the media, or even the judicial system, we expect regional decisions to reflect the preferences of these informal principals as well as the industry clients.

Just as some states have distinctive political cultures and strong environmental interests, other areas have historical and intermittent patterns of industrial distress which detract from a concern for environmental regulation. This distress increases the saliency of EPA decisions for industry so that they pressure for outcomes which do not create more financial hardships or industry layoffs. Conversely, environmentalists pressure for strong enforcement, particularly in those sections of the country where the problem is most severe and visible. Hence, the salience of the issue for each interest motivates them to be more aggressive in pressuring regional EPA staff to be responsive to their needs.

This suggests that regional variance in the relative leniency or aggressiveness of regional staff in the initiation of formal administrative actions are a result of structural and contextual forces. Like the NLRB, EPA regional staff are cross-pressured between formal and informal principals determined by their organizational structure. The relative influence of these principals is affected by the nature of the political context in which decisions are made.

Empirical Evidence: We used cross-sectional time series regression analysis to examine the relative importance of formal principals, informal principals, regional political context, and caseload on regional decisions to initiate formal administrative actions against firms. We used data collected by EPA which indicates the total number of formal administrative actions initiated by regional officials in each state from 1988 through 1991 in the TSCA program. These data were taken from an annual report from EPA's Office of Enforcement entitled "State-by-State Enforcement Data Summary." During these four years, the regional offices initiated 2,240 formal administrative actions throughout the 50 states.[18]

Using time series cross-sectional regression,[19] the model is identified as follows:

$$A_t = U_t - C_t + E_t + SNC_t + P_t + H_t + S_t$$

where:

A_t = number of administrative actions initiated
U_t = percentage of unemployment in the state
C_t = percentage of state GDP from chemical industry
E_t = number of environmental group members in the state
SNC_t = number of firms in significant noncompliance in state
P_t = dummy variable for pro-environment state
H_t = dummy variable for high caseloads
S_t = LCV average for Senate oversight committee

In the EPA model, the dependent variable is the total number of formal administrative actions initiated by regional personnel in each state over one year. The independent variables control for the political and organizational context of decision making. As a measure of the salience of TSCA enforcement to industry, we use the percentage of unemployment in each state. To measure enforcement salience for environmental groups, we use the total number of firms in significant noncompliance (SNC) in a state per year. We measure the strength of the chemical industry within the state by using the percentage of state gross domestic product (GDP) derived from chemical industry revenues.[20] The strength of organized environmental groups is measured by indexing the number of conservation group members per 1000 state residents.[21] We use an environmental assessment of the states' policies and laws to identify those states which are comparatively more environmentally inclined than most others.[22]

---

[18]Because the cases are aggregate totals by state for four years, the sample size for this analysis is 200.

[19]We used TSCSREG-Parks method in the SAS statistical package to estimate the EPA model. See NLRB model note for details.

[20]Unemployment data is from the Bureau of Labor Statistics' Statistical Abstracts. State GDP percentages for the chemical industry and state membership in environmental clubs were taken form the Green Index (Hall and Kerr 1991). Total number of SNCs were gathered from the "Enforcement Data Survey report from EPA.

[21]These conservation group members include Sierra Club, Green Peace, and National Wildlife Federation and its state affiliates.

[22]The Institute for Southern Studies combined program specific assessments with their own evaluations of state laws to produce a measure for each state which ranks the states from 1 to 50. The highest ranked state scored only 38. To include approximately the top third, we identified any state with a score of 25 or higher as comparatively pro-environment.

We also control for the influence of formal principals and other structural variables. Using a binary dummy variable to control for the influence of exceptionally high caseloads in a regional office, we aggregated the state data by region, and identified those regions with 70 or more cases per year as a high caseload state. For this variable, 1 = high caseload. To measure the influence of EPA's formal Senate principal, an index was constructed from the League of Conservation Voters (LCV) scores[23] for individual Senate oversight committee members in each year.[24]

Table 2 presents the results of the time series cross-sectional analysis of EPA enforcement activity. These results provide strong evidence that organizational and political context are important for agency decision making with all measures significantly influencing the initiation of formal administrative actions.

(TABLE TWO ABOUT HERE)

Because of the structure of EPA, we expected the Senate oversight committee to have significant influence over regional behavior. The results show that EPA's Senate oversight committee is able to successfully influence regional decisions. When the oversight committee preference index is high and pro-environment, more formal administrative actions are initiated in that year throughout the states. The other measure of structural context, caseload, is also positively related to enforcement actions. It appears that EPA regional staff are not using stalling behavior to cope with high caseloads. Instead, we observe more rigorous enforcement when caseloads are heavy. This is especially true when Senate principals are highly interested in environmental aggressiveness.

Political context also significantly affects the behavior of regional EPA personnel both in terms of distinctive cultures, the relative strength of organized interests, and issue salience. Enforcement actions are significantly higher in those states with a pro-environment culture since the variable controlling for pro-environment states is positively related to formal administrative actions. This suggests that EPA regional staff are aware of distinctive cultural attitudes throughout the state toward environmental regulation. When a pro-environmental culture exists, EPA regional staff respond by initiating more formal administrative actions.

Staff ability to respond to state culture is enhanced or tempered by the relative strength the competing organized interests. The variable controlling for the strength of the chemical industry is inversely related to enforcement. States with a higher percentage of their GDP derived from the chemical industry have fewer enforcement actions. Hence, the chemical industry successful in pressuring regional EPA personnel so that fewer cases are initiated in those states where they are strongest. Alternatively, the variable measuring the strength of environmental groups is positively related

---

[23]The LCV produces as yearly score card for members of Congress. Congressional records were used to identify members of the Senate Committee on Environment and Public Works.

[24]In preliminary analysis, we also included a dummy variable for the transition from Reagan to Bush as well as LCV average scores for House oversight committees. The TSCSREG-Parks analysis demonstrated very high collinearity between House oversight preferences, chemical manufacturing preferences, and club membership. The estimators were nearly linear and the model could not be estimated with House Scores included. Similarly, the analysis indicated that the change from Reagan to Bush was nearly constant, again, producing a biased estimate so that the influence of this principal cannot be included in this estimation. During this short time series, it is reasonable to assume that the influence of the Republican Presidents is quite similar.

to enforcement. We see significantly more enforcement actions in those states with a higher number of environmental group members. This suggests that EPA personnel are sensitive to the potential complaints of environmental groups in those states where they are most visible and active.

The salience of the issue as measured by issue visibility is highly significant but with one unexpected result. The visibility of the problem as measured by the number of significant noncompliers in the state is positively related to the dependent variable. Those states with a higher number of firms in severe violation of regulations have more visible TSCA problems than other states; they also have more enforcement activities.

We also included unemployment as a measure of the salience of TSCA regulation to industry. We expected that when unemployment was high, EPA regional staff would be more reluctant to issue formal administrative actions to avoid causing further financial distress for industry. Instead, we observed that higher numbers of cases initiated are associated with higher levels of unemployment. It is possible that this may be measuring the effect of financial distress on firm compliance and not the salience of enforcement for industry. Specifically, as firms experience financial difficulties, employees are laid off resulting in higher unemployment. At the firm, these layoffs probably indicate a reduction in variable costs including employees in charge of quality and compliance. If compliance and labor costs are reduced through layoffs of production and compliance personnel, more violations are probable, resulting in the need for more enforcement. Although provocative, this observation is somewhat speculative and warrants additional investigation.

Thus, the key influences on EPA regional staff decision making are both the formal and informal principals. These principals compete for influence over EPA activity. While structural context is important for constraining formal principals' influence from the top-down, informal principals as well as dominant political culture constrain decision making from the bottom-up. For principals to be successful in pressuring EPA regional staff for more aggressive enforcement, multiple forces must coincide. Specifically, EPA regional staff must work within a context of active oversight from pro-environment principals, a supportive political culture, and a highly salient issue. Importantly, the preferences of anti-environmental principals from both the top-down and the bottom-up constrain aggressive enforcement. This is particularly true when the political culture opposes environmental regulation and the issue is not visible.

Conclusion: Toward a Theory of Agency Responsiveness

The purpose of this study was to explore more deeply the argument that structural and political context are important determinants in agency decisions. More importantly, these influences help explain why, within a principal-agent relationship, agents deviate from or fail to respond consistently to principal cues and incentives. In particular, our goal was to expand this theoretical model to include a comparison between two different components of the federal bureaucracy each designed to limit opportunities for politicization of policy decisions by the president.

In respect to the influence of agency structure, we found that regardless of whether the agency is designed to be proactive or reactive, formal principals can successfully influence agency outcomes. The regional staff at both the EPA and the NLRB were responsive to formal principals as long as competing formal and informal principals share similar preferences. When either formal principals disagree or informal principals have preferences which are strongly and distinctly different from a formal principal such as the president, the formal principals may be unsuccessful in pressuring their agents at the regional level.

Although previous studies suggested that caseload constrains rigorous enforcement, this was not true in either the NLRB or the EPA. Rather, at the NLRB, our model showed no influence of caseload when regional characteristics were held constant. Importantly in the EPA, more rigorous enforcement is associated with higher caseloads suggesting that regional staff divert more attention to those areas with the most severe problems. The main difference is that the EPA determines its caseload while the NLRB cannot. While structure does not seem to determine the success of formal principals, it can affect the coping strategies which agents use to reduce the pressure of informal principals for less regulation.

The pressure of informal principals comes from the political context in which regional staff make their decisions. When there is a sympathetic political culture for active enforcement of regulation at the regional level in conjunction with strong organized interest which share this preference, regional staff respond with more enforcement. Agencies are similarly responsive to anti-enforcement pressures. Regardless of whether the interests or the agency initiates the enforcement action, responsiveness occurs irrespective of whether the organized interests are formal clients or affected interests.

Yet issue salience skews this balance of influence toward those interests which are particularly affected by enforcement outcomes. Agencies are particularly responsive to pro-enforcement groups when the scope and level of the conflict regarding the regulated activity are high. For example, when there are large numbers of firms in significant noncompliance, the EPA issues more actions. When the number of strikes increases, the regional NLRB staff dismiss fewer complaints by unions. On the contrary, when enforcement outcomes clearly worsen industrial distress, fewer enforcement actions occur. Typically, unemployment is used as an indicator of economic conditions within a region that may be affecting the stability of firms. Our results raise questions about the usefulness of this measure for all policy areas because of the unexpected results in the EPA model.

Thus, we found that regional office staff in the NLRB and the EPA are strikingly similar in their ability to pursue formal and informal principals' goals. Yet, we do not claim to have provided a comprehensive test of competitive influence of institutional structure and political context. In our future work, we intend to address a number of concerns. To properly test and compose a generalizable theory, we acknowledge the need to provide representation of executive departments and government corporations as components of the federal bureaucracy. In particular, we argue that a comparison of the diversity of organized interests between different components of the federal bureaucracy is necessary for constructing a general theory of principal-agent relationships and bureaucratic adaptation and responsiveness. Further, we argue that the institutional structure, including an agency's status an independent versus being enmeshed in an executive departmental structure creates additional barriers to principal-agent relationships and provides opportunities for multiple principals.

Finally, we propose that a critical, in depth, comparative study be conducted on the structure of field to national office relations examining personnel differences in professional training, partisanship, and length of service. By adding a third component, regional personnel characteristics, we can provide a generalizable, comprehensive theory of agency responsiveness to political pressure. This theory would describe not only the formal and informal principals' influences within the decision making hierarchy but also the contextual and individual level influences determining variation in implementation over both time, region, and agencies.

UPSCALING BUSINESS AND DOWNSIZING GOVERNMENT: FRANCE IN THE NEW EUROPEAN COMMUNITY

Vivien Schmidt

With all of the turmoil in the exchange markets since 1992, the most recent being the run on the franc in the face of the Bundesbank's continuing refusal to lower interest rates, there has been much talk of an end to the European Monetary System with its goal of a single currency, and therefore an end to the dream of a unified Europe. England and Italy's temporary withdrawals from the EMS have already weakened the it. Were France to pull out, it would be all but dead. This likelihood, along with such issues as national pride and political futures, are what have motivated French governments to seek to maintain a strong franc, despite the rise of unemployment and a slide into what six Nobel prizewinners, in a plea for French withdrawal from the EMS, have called a pointless recession, given France's low inflation rate and otherwise competitive economy.[1]

But even if the EMS were to have been merely a pipedream, it will neither mean an end to the EC nor a return to the status quo ante in the macroeconomic sphere. Moreover, even if the French referendum on Maastricht, with its all too close victory for the partisans of European unity (51% in favor vs. 49% against), is an indicator of public reluctance to take any great leaps forward with respect to European integration, this will not stop the ongoing policy developments with regard to the creation of the single European market, or produce any moves backward.

The rush toward European integration has already brought about great changes in the macroeconomic environment in all the countries of the EC, but in particular France, where the state has relinquished many of its traditional interventionist powers over the economy at the same time that it has encouraged the opening of the markets. The goal of a single European market has already had, and will continue to have, a tremendous impact in the microeconomic sphere on the rules governing business activity. In addition, the very challenge of Europe has pushed businesses to restructure and enlarge while it has encouraged governments to reshape their traditional relationships with business. In other words, even if European integration were to go no further, it has already gone very far indeed, changing the face of European business and its relationship with European governments. In no other European country has this been more true than in France, where business has upscaled while government has downsized in response not only to the reality but also, and most importantly, to the very idea of European integration.

European integration has had three orders of effects on French government and its relationship to business: the first order effects come from the direct application of EC policies and directives; the second order are the indirect result of the implementation of EC directives; and the third encompass initiatives in anticipation of European integration or in response to the first and second order effects.

The first order effects have largely been documented. These have directly altered the state's role in the economy and, thereby, the regulatory environment for business. They consist of changes in the macroeconomic sphere that include the state relinquishing control of exchange rates, the opening of the financial markets, the ending of price controls, and so forth. In the microeconomic sphere, they encompass changes in competition policy, product standards, sectoral rules governing different businesses, and all that the opening of the borders entails in terms of the free movement of professionals and workers.

The second order effects come from the impact that the very implementation of EC policies has indirectly had on French government and its relationship to business. These effects are less apparent, but every bit as significant as the first order effects, since they have loosened the ties that

have traditionally bound business and government by undermining the statist model of industrial policymaking, where governments have typically formulated policy unilaterally but allowed societal interests in at the implementation stage with the politics of accommodation, cooptation, or confrontation.

The primacy of Brussels in policy-formulation has, to begin with, increased the independence of business, which now looks as much to Europe as to the nation-state for policymaking. At the same time, it has decreased the independence of government, which not only no longer has the authority to make policy unilaterally, but also has deprived itself of its interventionist policy instruments of the past. Government, in consequence, naturally finds itself less able to influence business, which concomitantly needs government less for guidance and support as a result of the new competitive environment and the opening up of non-governmental sources of financing. Finally, the increasing independence of business has only been reinforced by the introduction of the EC regulatory model, which demands an arms'-length relationship between business and government and the even-handed application of the rules. This has served to weaken France's traditional pattern of policymaking even further, since it calls into question the administrative nature of the French state, where making exceptions is the rule. But it also decreases business' ability to pressure government, since it can no longer have as much of a say at the implementation stage. The result is that in the application of EC rules or of those of the new French regulatory agencies, all societal interests, and not only business, will find less accommodation and therefore may engage in more confrontation, albeit with less success. Only where the traditional relationship between ministry and industry remains will business find more cooptation with regard to state oversight.

In short, while the first order effects have changed the way in which government leads and business competes, the secondary effects of European integration have altered the manner in which government and business interact, replacing the formerly close, nearly symbiotic relationship with one in which government leads less and business competes more.

The third order effects have little direct or indirect causal relationship to European integration, but rather come from government initiatives in response to the competitive challenge represented by European integration, and in anticipation of the first and second order effects. In France, these encompass most of governments' industrial policies through the eighties. To begin with, French industry's problems in the seventies resulting from the end to tariff barriers and other external constraints were in large measure responsible for the Socialists' decision to nationalize in the early eighties. Secondly, the increasingly competitive environment for businesses that were themselves changing through concentration, consolidation, and internationalization in response to the rush toward 1992 led to successive governments' decisions to find ways to dilute state ownership and/or diminish state control of public enterprise. This occurred progressively, beginning in 1983 with informal privatizations and increasing autonomy for public enterprise; accelerating with the formal privatizations of 1986-1988; persisting afterwards, with the trading of shares first among nationalized companies alone and then with privatized companies; and leaving us with a new round of proposed privatizations today.

These third order effects have, together with the first and second order effects of European integration, in a very real way ensured the rise of business and the decline of the nation-state. For while business has become less dependent on national governments and more interdependent and international, the French state become more dependent on the European Community, losing many of its traditional powers and some of its national sovereignty. It did this willingly, of course, in order to gain other benefits, i.e., greater control over its macroeconomic environment and a larger arena for its ambitious industrial policies. But as both of these have begun to prove elusive, some may increasingly question whether all of this has been worthwhile, especially given the problems for French democracy resulting from EC control over French domestic policy formulation and the

regulatory model for policy implementation, which together are leading to the increasing disenfranchisement of national citizens and elected officials alike.

Changing the Regulatory Environment for Business: First Order Effects on Government

Ever since the Treaty of Rome, the EC has been a major spur for French governments to move away from a state-directed economy to one with a greater emphasis on the market. This has been a gradual but ineluctable process, one in which each action in conformity with EC policy has, taken together with other exogenous factors, so undermined the effectiveness of the traditional set of policies that it literally forced governments to adopt new EC-inspired policies which brought even greater market openness and a larger commitment to European integration.

This began with the move away from France's traditional protectionism, as mandated by the EC, along with the abandonment of a number of specific policy instruments such as preferential taxation and public procurement policies, non-tariff barriers and certain kinds of industrial subsidies.[2] These measures, which opened the domestic market to greater competition, taken together with a whole panoply of problems related to external economic constraints such as the end to the fixed exchange rate system that had enabled French governments to correct payment deficits through devaluation, the impact of the two oil crises, and so forth, decreased French governments' ability to manage the economy. These constraints, in effect, undermined not only the French governments' traditional macroeconomic tools for controlling the economy, e.g., the encadrement du credit, or the system for rationing credit, but also their microeconomic tools, whether the national plans which no longer accurately forecast economic trends or the industrial policies which no longer adequately sorted out the most appropriate industrial investments.[3]

The entry of France in the EMS in 1979 by the Barre government represented an attempt to regain some control in the macroeconomic sphere, serving to reduce inflation by pegging the franc to the Deutschmark. But it also limited France's ability to devalue or to adopt an independent monetary policy. Moreover, within a very few years, it led to a crisis for the Mauroy government, whose expansive macroeconomic policies and expensive microeconomic policies (see the discussion below under third order effects) were totally out of step with those of fellow European Community members.

This came to a head in the macroeconomic sphere between June 1982 and March 1983, when the Socialists agonized over whether to stay in the EMS, and therefore begin to reduce the budget deficit and deflate the economy, or to exit, and thereby sustain reflation by devaluing the franc and putting up protectionist barriers to imports in order to stabilize the trade deficit.[4] For some, only the discipline of the EMS would permit France to retain its place in global competition; for others, the only quick escape from the crisis was to get out from under the Community environment with its impossibly high interest rates.[5] With Mitterrand's decision to stay in, France had to cut back public spending, scale back aid to industry, in particular to the nationalized industries, and allow more bankruptcies. It also had to cut back on its social policies, since bringing down inflation of necessity took the place of bringing down unemployment rates.

Moreover, absent the resources that its inflationary policies had allowed it, the Socialist government was no longer able to stimulate industry through demand using its traditional industrial policy instruments. It therefore had to improve the competitiveness of French firms through more supply side measures. This had actually started even before the great U-turn of 1983, in 1982 with the deindexation of salaries on prices, and the 1983 law on savings, which allowed the introduction of new debenture shares and investment certificates. With the decision to stay in the EMS and

therefore to embrace European integration wholeheartedly, moreover, liberalization now anticipated European Community directives as much as followed them.

The liberalization accelerated under Prime Minister Fabius, who put an emphasis on profit and faith in the market. As of 1984, the Socialists put through measures encouraging competition in the banking system, relaxing regulations in the financial markets, authorizing many new financial instruments, loosening controls over exchange rates, partially eliminating price controls, and reducing a variety of business taxes, including the prélèvements obligatoires, or payroll taxes, and the tax on revenues. In the capital markets in particular, they established a second market in unlisted securities and a third in financial futures. Finally, in 1985 they even went so far as to consider a law on competition which, though never passed, was to have reinforced antitrust measures and loosened restrictions on competition. Moreover, public sector wages were held down and regulations affecting firms' ability to lay off workers loosened.

The neoliberal right only continued in this direction. Thus, they decontrolled prices and created a Council on Competition. Moreover, like Fabius, they focused first and foremost on bringing down inflation and the budget deficit, although they were even more supply side in their approach to industry, cutting taxes rather than increasing financial aid to corporations. And they went further in the deregulation of the securities, futures, and foreign exchange markets; in the reduction of payroll taxes, corporate taxes (by 37 billion francs over two years), and the business tax; in the ending of most price controls; and in the passage of the law on competition which replaced the two ordinances of June 30, 1945 (along with the approximately 30,000 rules which grew up around them).[6]

On top of policies that simply extended those of their Socialist predecessors, the neo-liberals introduced a number of entirely new policies. Most notably, they overhauled monetary policy as of January 1, 1987, by replacing the system of rationing bank credit, the encadrement du crédit (which they themselves had instituted in 1974 when they were known as conservatives) with a system in which the Banque de France would control the money supply by manipulating interest rates.[7] They also liberalized controls on corporations' stock issues and passed the law on savings which facilitated leveraged management buyouts (LMBO) and employee stock ownership plans (ESOP) as well as encouraged employees generally to buy shares in the firms for which they worked (especially in the newly privatized ones). Moreover, they created what Balladur dubbed the petit bang which broke the 180 year monopoly of the 60 official French stockbrokers, replacing the old system with one in which the administrative tasks related to the running of the stockmarket are separated from the regulatory and oversight functions carried out by an elected council. This anticipated way in advance of 1993 the scheduled end to the stockbrokers' monopoly, when the 12 member countries of the EC would be able to trade on the Paris Bourse and the six regional stock exchanges.

Subsequent Socialist governments continued with the liberalization policies and the emphasis on what Minister of Finance under the Rocard and Cresson governments and then Prime Minister Pierre Bérégovoy called "competitve disinflation," giving priority to budget reduction and focusing on supply side microeconomic policies. The Rocard government reduced corporate taxes by 10 billion francs in its 1989 budget, cut taxes on individuals by 5 billion francs and increased public spending in line with inflation, that is, by 4.5%. Morever, it reduced taxes on revenue from savings and on consumption (by reducing the TVA, as mandated by the EC, despite Rocard's criticism of its "pauperizing" effect on the State). At the same time, however, Rocard spent a lot on a variety of measures for the poorest workers, on public employees' salaries (in particular the nurses, transport workers, postal employees, and tax collectors), on the national education system (from 198 billion francs in 1988, it grew to 250 billion francs in 1991), and on modernizing the public sector (expected to cost over the next seven years 42 billion in constant francs, of which the state was to pay 22 billion).[8] Similarly, while Prime Minister Cresson continued with tight

monetary policies, she continued spending to modernize of the public sector, although she reduced it for the health sector and for the military. Finally, Bérégovoy himself, having in 1983 argued for exit from the EMS, but having subsequently undergone a total conversion at the time of his first stint as Minister of Finance between 1984 and 1986, had become the EMS' greatest defender by the time of his appointment in 1992 as Prime Minister. In addition to keeping inflation down in order to maintain stable prices and keep the franc strong, he reduced fiscal pressures on business yet again, in particular in reducing the rate of taxation on profits (it went from 50% in the early eighties to 33% for 1993).

For all this liberalization, however, French governments between 1983 and 1993 kept a certain number of industrial policy instruments for themselves; deregulation did not leave everything to the market. For example, in the 1986 ordinance on the control of mergers and acquisitions, Balladur kept the sole power to refer any issues to a new Competition Council which was itself limited to giving advice, and not allowed to provide binding opinions, as is the case in England, where the minister cannot forbid a merger once a favorable opinion has been given by the Monopolies and Mergers Commission, or in Germany, once a merger has been authorized by the BundesKartellamt. This meant not only that the Minister of Finance could accept or reject the decisions of the new Council, but also that the Minister could choose not to refer, thus leaving everyone in the dark until a takeover is complete, even if the takeover violates the rules. This was the case under Rocard, where although Air France's acquisition of Air Inter and UTA went way beyond the threshold level anticipated by the ordinance of 1986, the Council was not brought in.[9]

In addition, the French also managed to ignore Community rules in certain cases. Thus, in the privatization program, the French limited foreign ownership to a 20% share despite the fact that the limitation on European ownership violated the laws of the European Community. In this, however, they were not alone; they were simply more inept. All European governments have found ways around Community rules that forbid discrimination in aquisitions of the companies of one European country by others that are also Community members. The Germans or the British, however, tended to camouflage their actions better through the use of antitrust criteria, e.g., Germany's Office of Cartels objected to Thomson's acquisition of Grundig on the grounds that the former would thereby gain a dominant position in the German market in consumer electronics.[10]

Even this has escaped country control, however, since the European Commission now decides the fate of mergers and acquisitions of companies where the overall sales are above 5 billion écus. For the French, this came home quite forcefully with the refusal by the Commission to allow the takeover of the Canadian firm Havilland by Aérospatiale and Aléna on October 2, 1991. It is important to note, however, that this was the only case among hundreds of takeovers looked into by the EC.

Similarly, moreover, despite constant French complaints to the contrary, the Commission investigations of aid to French nationalized enterprises have mostly resulted in decisions favorable to France. Although the General Directorate that deals with competition policy under the leadership of Leon Brittan has time and again undertaken investigations of France's capitalization of its nationalized industries, arguing that it represented unfair competition, France as often as not has gotten its way. For example, in 1991, just as the French were gearing up for what they were certain to be EC rejection of direct or indirect (through other public enterprises) capital infusions, the Commission approved 6.68 billion francs in aid to Bull because although they saw it as a subsidy (since it would not have received a similar amount under similar conditions from an investor on the market), they recognized it as part of a radical restructuring plan. It also approved the injection of 2.5 billion francs into Usinor-Sacilor by the Crédit Lyonnais for a 9% share in the company because EC Commissioner Leon Brittan found it in keeping with the principle of sound free market investment. The 2 billion francs for Air France were also approved. Only Renault, in any earlier capital infusion, had to give some money back.

Thus, although the French have not given up on a role for the state in response to European integration, it is a different role. Integration has changed the content of French industrial policymaking, with direct state intervention focused on the demand side increasingly replaced by indirect state action concentrating on the supplyside, and with the market, not the state, seen as paramount. This in turn has affected the process of French industrial policymaking and the relationship between business and government.

Loosening the Ties that Bind: Second Order Effects on Government and its Relationship to Business

European integration, by depriving French governments of many of the policy instruments at both macro and microeconomic levels with which they traditionally influenced business, has undermined state autonomy. At the macroeconomic level, this loss of autonomy has resulted in a tradeoff where, by giving up independence in policymaking, governments have regained control over the economy. At the microeconomic level, there have been no such tradeoffs. The loss of autonomy has weakened France's traditional statist model of industrial policymaking at both formulation and implementations stages, thereby loosening the ties that have for a very long time closely bound business to government.

Much of scholarly attention in recent years has focused on the second order effects resulting from the push toward European monetary union and the Maastricht treaty, the opening up of the financial markets, and so forth. This is natural, given that the resulting macroeconomic changes have been dramatic: governments have virtually given up their sovereignty with regard to monetary policy, and they have lost many of their interventionist tools. This has been more significant in France, where the state through its control of the banks and its virtual monopoly over credit has traditionally held wide powers over the economy, than in England, where the system of capital allocation has for a long time been based on highly developed capital markets which ensured that however much the government might have liked to intervene, it did not have the necessary tools.[11]

At the same time that France has given up sovereignty in macroeconomic policy, however, it has to a large extent gotten back its ability to manage the economy effectively. Although the shift toward liberalization could be seen as simply a giving in to external constraints, and therefore as a defeat for the traditionally strong state in macroeconomic policymaking, it is more appropriately understood, as Michel Loriaux argues, as an attempt to "restore the state's power to exercise control over the evolution of fundamental monetary quantities: monetary growth, prices, credit, and the values of the currency."[12] By giving away some of its independence in macroeconomic policymaking, in other words, France took back control. And although the room for manoeuver is smaller, as André Lévy-Lang, head of Paribas, remarked, it is all the more reason for the French government to play its role.[13]

In the microeconomic sphere, by contrast, France gave away much of its independence in policy formulation along with much of its control in policy implementation. At the formulation stage, Brussels has undermined Paris' traditional pattern of unilateral policymaking, not only by being the primary locus for decision-making, but also by letting national interest groups into the supranational policy-formulation process. At the implementation stage, the loss of state independence has been compounded by the increasing independence of business that results not only from the first order effects of European integration, that is, deregulatory measures and non-governmental sources of finances, but also from the second order effects at the formulation-stage, that is, the new EC level business-government relationship. Complicating this even further is the substitution of the EC regulatory model for the administrative one which, together with the other second order effects, have served to disrupt the traditionally close state-industry relationship with its politics of accommodation, cooptation, or confrontation.

The Statist Pattern of Policymaking

Traditionally, France's pattern of industrial policymaking has been "statist," meaning that government decision-makers and decision-making organizations take a leadership role in policymaking and have primary control over structuring the "state-society relationship," dictating the pattern of interest representation and resisting the pressures of interests, whether organized or not, where they choose.[14] At the formulation stage, this means that governments can undertake "heroic" programs in which government leadership remains paramount and consultation is often minimal. The most recent examples of these are the programs of nationalization under the Socialists in 1982 and privatization under the neoliberal right between 1986 and 1988.

Although often using other terms, most French scholars have taken account of this "heroic" statism, typically portraying France as the ideal-typical, strong state, insulated from the political community and centralizing enough to ensure it at least partial autonomy,[15] with institutions which provide it with "tactical advantages" that enable it to take independent action[16] and to manifest a policy style notable for its capacity not merely to initiate far-sighted planning efforts but also to impose them where it deems necessary.[17] Some scholars, primarily in France, systematize this pattern, seeing state-society relations as forming a system in which the state remains central, dominating the political agenda and monopolizing the construction of the populace's worldview, organizing and controlling societal interests, and taking charge of the implementation of public policies.[18] Moreover, they see policy not only identified by a small group of the administrative elite, the "central decision-making milieu,"[19] but also implemented by it with minimal public debate.

And yet, however strong the state may appear, it suffers from many weaknesses. First of all, the image of the strong state hides great fragmentation because of rivalries both between ministries and within ministries.[20] Secondly, in numbers of instances where policies are more "everyday" than heroic,[21] the boundaries between "state" and "society" become blurred, and societal interests may even take over government's policy formulation function (this was the case with the notaries.)[22] Finally, however much the government may seek to impose, societal interests can and do effectively resist.[23] The state is not really able to govern by decree because, as Shonfield noted already in the sixties, "The system will not function unless private organizations give their willing collaboration to the pursuit of public purposes. What is therefore required is the opposite of a bully state--rather a wheeling and dealing type of public authority constantly seeking out allies, probing and maneuvering for the active consensus."[24]

France's statist polity, in effect, is one in which governments' ability to take unilateral action at the policy-formulation stage, without prior consultation with those most interested in the policy, is tempered by their need to respond to societal interests at the implementation stage, where policymaking is characterized by the politics of accommodation, cooptation, or confrontation. Much depends upon the centrality of the policy to the government, its strategy, the policy's potential impact on the most affected interests, and these interests' level of access, upset, and organization.[25] Only in an authoritarian statist polity could an unelected government not only formulate policy unilaterally but also impose it unilaterally, without attention to societal response.

Responsiveness to society at the implementation stage in statist policymaking is facilitated by the administrative nature of the state, where civil servants have wide latitude in interpreting the law, and even making exceptions to it when they see fit. This is in stark contrast to the regulatory model which denies civil servants much latitude by comparison, and where making exceptions to the rules is regarded as illegitimate. In France, the relationship between formulation and implementation was captured years ago in de Tocqueville's famous phrase: "the law is rigid, but the application is flexible." This means that laws formulated absent societal input can be adapted

in the implementation process, ensuring that societal interests can be heard, but giving civil servants the discretionary power to listen or not.

In the industrial policy arena in particular, the flexibility of the rules have been legend, with exceptions to the rules one of the ways in which civil servants could influence business. The most important of the policy instruments available to civil servants in this arena, however, was public investment, which enabled government to hold sway either directly through the granting of subsidies and loans, or indirectly, through its control over the allocation of credit.[26] The state could in addition exert influence over business indirectly not only as a buyer of goods, but also as a seller, by way of the nationalized industries.[27] Finally, the state had significant leverage through price controls, regulation, and taxation, not only by enforcing the rules, but also by selectively granting exceptions to them--a pattern which enabled the state to appear not only as punisher of transgressions but also as rewarder for good behavior.[28]

The result was that in national planning and industrial policy, the state could ensure a cooperative relationship that was primarily one of mutual accommodation, although over time it began to look more like cooptation, as governments led less and the initiative often shifted to business. Thus, although in the sixties Shonfield saw the national planning relationship as constituting almost a "conspiracy to plan" between ministry and industry[29] while in the seventies Charles Lindblom explained that same relationship as "in some part even an explicit exchange of favors,"[30] by the 1980's, Jack Hayward could argue that industrial policy, which had replaced planning as the preferred governmental tool, "frequently amounts to an industrialists' policy."[31]

In fact, the closer ministry got to industry, the more accommodation began to look like cooptation. Thus, in sectoral planning and policy, many scholars have documented the relative independence of industry from state control, and the ability of industry to impose its agenda on government. In the steel industry, the ministry-industry relationship involved a "corporatist-style collusion," orchestrated by the industrial trade association rather than government, in which "there was an abandonment of autonomous decision making by the steel firms and a rejection of arm's length remoteness from detailed policy intervention by the various government agencies and political leadership."[32] In the case of oil, it was the French state that was "captured" by industry, as the oil companies in some sense dictated state policies as a result of their greater expertise.[33] In other sectors, cooptation was not nearly so pronounced--but the mutual accommodation devolved primarily to industry's benefit. In the cases of such industrial groups as Thomson and CGE, the various planning contracts and concommitant government support ensured that while the State took the technical and industrial risks, the enterprises carried out the industrial projects and disposed liberally of the resulting profits.[34]

Although accommodation and cooptation were the norm, confrontations did occur, as when the government temporized for close to seven years on the SNCF's fast-speed train project.[35] Confrontation, however, was more the exception than the rule, and this even during the most interventionist of periods, that of the restructuring of the nationalized industries in the early eighties, when industry nevertheless as often as not got its way.[36] Thus, although Saint-Gobain was displeased with the policies it saw as forced upon it, Thomson, CGE, and others were quite content. Moreover, in many cases where there was confrontation, it was soon followed by government capitulation to industry demands, as in the case of Thomson's proposed sale of certain of its operations in 1983. But even where the government held to its decision, this was generally sweetened by government promises of capital grants or loans.[37]

In short, business and government over the years developed a close, near symbiotic relationship which ensured that while government may have had its way at the formulation stage,

business more often than not got its way at the implementation stage. Most of this has been in the process of changing as a result of European integration.

The Impact on Policy Formulation

In the first place, European integration has meant that the government has lost much of its ability to formulate policies independently, thereby significantly weakening one of the most distinctive features of the statist pattern of policymaking. In fact, the sphere in which French policymakers can act independently, without attention to the EC, has gotten narrower and narrower. Jacques Delors himself predicted in a speech to the European Parliament in July 1988 that ten years hence 80% of the acts of national legislatures would be of EC origin. French bureaucrats are more and more in the business of implementing policies formulated in Brussels rather than in Paris.[38] In addition, because EC member governments no longer have veto power over Community decisions, given the shift to qualified majority voting with the Single European Act that went into effect in 1987, the French administration could even be implementing policies that the French government opposed. Because of this, effective interaction with Brussels at all levels has become crucial.[39]

French influence with the EC bureaucracy, however, is not nearly as great as the French would wish, leaving it with what many French see as a distinctly Anglo-Saxon bias. This comes from two sources, both having to do with the French administrative culture. The first stems from the minimal French civil service presence in Brussels until comparatively recently; the second from the French lack of understanding of EC administrative culture.

The first problem results in large measure from French ministries' longstanding underestimation of the importance of the EC administration. Because French bureaucrats were slow to recognize the significance of the EC as an administrative, as distinct from a political, policymaking body, they were even slower at encouraging the "best and the brightest" of the younger civil servants, that is, graduates of the ENA or Polytechnique, to forsake national for EC service. This in turn has ensured that comparatively few find themselves in the upper levels of an administration where civil servants start low and stay long in the Directorates, acceding only late in their careers to major positions (by contrast with the French system in which young graduates of the ENA start high, go higher, and then more out to head a private or pubic enterprise).[40] The Ministries themselves, moreover, were late in feeling the need for their civil servants to know European policy and law,[41] or to have a continuous presence in Brussels. In this regard, the Director-General of Industry, Jacques Maisonrouge, expressed his shock that, when he was appointed in 1987, there was not much of a relationship between the Ministry of Industry and Brussels. He noted, moreover, that a very serious problem for the French was that the important posts were held by the English and the Germans, because the French were not interested in making the EC a career. And finally, he complained that although standards are set by the Association des Normes, which is under the jurisdiction of the Ministry of Industry, it has no influence other than negative, rejecting proposed standards rather than working with the Association to develop them.[42] This last problem, however, comes from France's second source of difficulties with the EC administration, i.e., that its civil servants are not culturally attuned to the policymaking process.

French civil servants do not always do a very good job of representing French national interests within the EC administration (although they may very well at the level of the Council or the Commission) because of the culture clash between EC and French administrative practices. As Pascal Lamy, director of the cabinet of Jacques Delors, has remarked, French civil servants have been finding the culture of consensus of the EC bureaucracy difficult to deal with, since they are used to much more conflictual relations in interministerial committees, with the Prime Minister or President called upon to mediate the conflict and to make the decision.[43]

The cultural problems for the French, while significant in the drafting of regulations or directives, where civil servants negotiate and France is officially represented in the tour de table, is even more so in the case of decisions, which are more internal to EC administration.[44] In France, in effect, ultimate decision-making in the ministries is political, and the most important level of decision-making is at the top, so that any decision on a dossier, however technically competent, may be reversed higher up, by the minister or even, in the case of particularly sensitive cases, by the Prime Minister or President. By contrast, in the EC general directorates, decision-making is only minimally political, and the most important level is at the bottom, where the first level senior civil servant charged with a given dossier has the most weight. This is therefore the place where any lobbying by national civil servants or business must focus. Lobbying itself, moreover, unlike in France, involves providing detailed technical information to the civil servant in charge of the dossier, not simply an excellent lunch for the Commissioner.[45] Because universal suffrage is not here to legitimate their actions, these first level civil servants make every effort to hear all sides and to base their decisions on purely technical and economic arguments, and therefore are open to technical, but not political, persuasion. Moreover, once they make a recommendation, it is extremely difficult to reverse it. The commissioner at the next level up has difficulty changing the recommendation on anything other than purely technical grounds, as do the seventeen commissioners even higher up, who make the final recommendation. The cultural misunderstandings were amply demonstrated in the De Havilland case, where most French incorrectly assumed that the process was political, not technical, and where business and national civil servants were not up to the lobbying task.[46]

The French do not only have difficulty playing the regulatory game in Brussels because of differences in administrative culture, they often have difficulty accepting the results of the regulatory process. This is mainly because they are used to an entirely different model of policymaking, where in gross terms governments formulate policies, civil servants prepare and implement them, and the courts ratify them, rather than one in which civil servants and/or courts may even formulate policies and impose them on governments.

For the French, therefore, the decisions of EC regulatory bodies or the courts are much harder to take than EC directives or regulations. Because both regulations and directives come out of a lengthy process of negotiation at the EC level, with directives in particular leaving governments great leeway in determining how to implement them, French governments feel that they have a significant amount of control over them.[47] In the environmental protection area, for example, the directives are the compromises resulting from hard bargaining by member countries, with all giving up something and getting something in return.[48] More generally, there has been little outcry at the loss of the governments' traditional policy instruments because this was voluntary, a result of the French decision in 1983 to stick with the EMS they had joined in 1979, to pursue the goal of a common market more rapidly with the Single European Act and to attempt monetary union with the Maastricht treaty (at least until recently).

By contrast, where the policies do not result from a process of negotiation, as in the binding decisions of regulatory bodies or the European Court,[49] the French tend to be much readier to question their legitimacy. It is telling that whereas the French were ahead of many member states in translating European directives into national law, they were way behind in heeding warning letters from the Commission or orders of the Court of Justice.[50] This is because the French are generally uncomfortable with what they see as the European Court of Justice's judiciary activism,[51] or what they assume to be the lack of responsiveness of regulatory bodies, as in the de Havilland case. This may be an added reason for the French push for the Single European Act and the Maastricht treaty, since they constituted limitations of judicial power (even as they consecrated judicial decisions, as in the standard of mutual recognition) in favor of political power.

In any event, whatever the source of the policy, and whether it be regulation, directive, or decision, there is a general acknowledgement that the French government has lost its independence, and that instead of directly preparing the rules it administers, the bureaucracy now implements rules forged in Brussels, where it can act in the creation of such rules only as a "lobbyist" representing one state out of twelve.[52] For business in particular, the fact that the EC can impose and French governments can do little else but obey has affected their traditional relationship with government.

Business, despite its privileged relationship with French ministries, now recognizes that this neither is nor can be enough. Brussels is as important as Paris, especially since Paris no longer has veto power over decisions taken in Brussels (with the qualified majority rule). Moreover, business is expected by Brussels to make its views heard directly, and not only through the intermediary of the French mission. Unlike in the traditional French policy process, where business interests had their main input at the policy implementation stage, in the European process business interests have their main input at the formulation stage.

Thus, lobbying activities that are still regarded as illegitimate at the national level, and are therefore still not very highly developed, have become quite sophisticated at the supranational level. French government officials who frown on lobbying when it involves the national government even encourage it when it involves the EC.[53] The result is that French business has effectively organized itself to lobby in Brussels not only as charter members of European business associations such as UNICE and of the various European groupings of national umbrella organizations, but also as members of national associations, or even as individual firms.[54] On their own, moreover, French CEOs also have direct albeit informal impact through face-to-face meetings with European commissioners. In short, whether as part of European business associations, national associations, or as individual firms, French business plays a role not only in influencing policy, but also, in some instances, initiating it, since European business often participates with the European Commission in seeking to impose a policy on reluctant governments.

With business as the primary interest being heard at the EC level, though, neither corporatism, which demands a relatively equal balance among industry, labor, and government,[55] nor pluralism adequately describe the relationship. For although the system may be "transnational pluralism" in form,[56] it is not so in content, at least ideally, given the one-sided nature of interest-group politics where industry dominates and opposing interests representing consumer groups, labor, and so forth are virtually absent. In fact, while French business was quick to recognize the need to organize at the EC level as well as to prepare for the new, competitive European environment, many of the major unions were slow to organize, too busy trying to defend themselves against that very environment, fearing a loss of jobs and privileges.[57] But even had the French unions paid more attention to the EC, they would have had little impact because there is no cohesive, pan-European labor movement to make their case at the European level at the same time that they have been losing ground at the national-level.[58] It is only recently that there has been some indication that labor has been organizing more effectively.[59]

But despite French business' access, it too sometimes has problems making itself heard by comparison with the lobbies of other countries. This goes back to issues of cultural difference. The fact that lobbying is comparatively underdeveloped in France and business interest groups not always very cohesive makes French business less effective at the EC level than those countries with better developed lobbies and more cohesive peak associations, e.g., the Germans. Because they are used to very close, symbiotic relationships which allows them great leeway at the implementation stage, but little input at the formulation stage, French businesses find it hard to adjust to the greater openness, or porousness, of the EC formulation process. Moreover, in

regulatory decisions, because they expect to interact with a bureaucracy that tends to operate without much technical input from business at the formulation end but is accomodating at the implementation end, it has had difficulty organizing itself to get information quickly enough to the civil servants in charge of the dossier that affects them. The de Havilland decision is a case in point.[60] Finally, because they are used to an interaction where they were generally the privileged interlocutors, they find it difficult to adapt to a situation in which they have to deal with a whole range of interests from a variety of countries--and where French bureaucrats have themselves in some sense become lobbyists.

Whatever the problems for French business of lobbying the European Commission, the very fact of their access to the decision-making process at this level has increased their independence from the national government, since they are now as much partners with national ministries in efforts to influence the EC as they are supplicants of national ministries to influence the EC for them. As partners in the EC lobbying effort, moreover, the government tends to see business more as defenders of the interests of the French nation than as a lobby that might have its own interests at heart, and not those of France in particular or Europe at large. It is as if the old notion attached to public enterprise, in which it was seen to act as a catalyst for social reforms and industrial innovation, leading the nation forward, has been generalized to all big French businesses, despite the fact that increasing numbers are private or on the road toward privatization, and that their goals, whether public or private, are profitability above all.

This sense that however independent business is, it still serves the national interest, pervades not only interaction related to European policy formulation, but also continues to characterize the entire French business-government relationship. The only problem, however, is that it has becoming increasingly one-sided, as government gives and business takes. As Elie Cohen explains it, the "attributes of sovereignty" that French business gained in the past from its relationship with government remain, leaving unchallenged the idea that French business operates in the national interest through the creation of French jobs and plants and through the trade balance, and that in exchange the State owes it attention, assistance and protection. That this is not challenged, according to Elie Cohen, has to do with the fact the State has not yet figured out how to operate in its new, more modest role, and reflects the continued crisis of national sovereignty.[61]

That crisis, in fact, has ensured that as the French state has lost its authority for this and other reasons (including scandals related to corrupt election financing and the distribution of tainted blood), business has gained in stature, becoming almost an unchallenged authority in France.[62] And this has only been enhanced by the fact that at the head of the major business firms, as often as not, are individuals whose education and career paths have been state-centered.[63] This means that in many cases the very civil servants who helped shape the policies formulated by French governments are now the CEOs helping shape the policies formulated by French governments in conjunction with their European partners (e.g., the current head of Renault was in Delors' cabinet; the number two at the BNP was formerly director of the Treasury; the current head of Aerospatiale was director-general of industry, etc.)

The new position of business is also related to changes in its size and organization. Because over the course of the eighties French firms have consolidated, concentrated, and expanded worldwide in response to the challenge of European competition (in 1990 alone the French spent $12 billion in the United States of an overall $30 billion),[64] they are no longer the parochial firms focused on domestic markets and interested in protection above all. Instead, they have become supranational firms for which the EC is their natural interlocutor and other European supranational firms their natural allies. As these supranational relationships develop, they serve to loosen further the ties that bind at the national level.

The Impact on Policy Implementation

In the policy implementation process, business' new position of authority has meant that it has gained increasing independence from government. This has only been helped by the primary effects of European integration. For the more French governments have relinquished the policy instruments that they had in the past used to orient business investment and gain business aquiesence, and the more they opened up the markets and deregulated the economy, the less business has needed government. As business has been increasingly subject to the imperatives of world competition, the constraints of the market, and the demands of technological advancement, it has looked less to government for guidance. And as alternative sources of financing have grown, business has turned less to government for support.

This has been true for public as much as for private enterprises, with both imposing their own strategies on compliant ministries and finding their own sources of financing. Thus, for example, what distinguished the launching of the Airbus A321 the most is less the near abandonment of any directive role by the Ministry of Defense in the face of the superior commercial expertise of the manufacturers than the fact that the manufacturers chose to finance the plane exclusively through the banks, and without any public financing.[65] This is not to say that the Direction Générale d'Armement (DGA) has no role to play any longer, but that its role has become more one of "justifying and accompanying" the strategic policies decided autonomously by the heads of the enteprises themselves.[66]

In fact, although the politics of accommodation, cooptation, and confrontation remain to some extent, their rate of incidence has changed. Businesses, with greater access to policy formulation at the EC level, are much less likely to need the politics of accommodation in the implementation process. Moreover, since the state no longer has the policy instruments and the virtual monopoly over credit that enabled it to "persuade" as it had in the past, cooptation tends much more to be the rule. For public enterprises, moreover, this has been increasingly the case not only for firms in the competitive arena, but also for those in the service area. These had been traditionally subject to great interventionism, with prices often set for political and social rather than technical considerations and with little concern for the impact on the level of investment or indebtedness of the firm. France Telecom (telephone), the EDF (electricity), and GDF (gas), all of which suffered in different ways from this, have relatively recently been reorganized in such a way as to make them less vulnerable to this kind of pressure.[67]

The incidence of confrontation, however, has also increased as a result of the new regulatory nature of policy implementation, although less so for business than for other societal groups with less access to the policy formulation process at the EC level. Because societal interests had come to expect that even if they had little input into policy formulation, they would at least be heard during the implementation process, tensions, in what has always been a more conflictual model than the cooperative one of other EC countries,[68] are likely only to get worse. In the past, where societal interests did not approve of a policy, they were generally more successful at blocking its application than in working with the administration to make it acceptable to all concerned.[69] Now, and until societal interests generally organize themselves to influence policy formulation at the EC level, they are likely to be confronted with decisions which they cannot block. In certain sectors, especially where the EC has imposed a policy decision not to the liking of societal interests, confrontation is more likely to occur because the government has no option other than to implement the decision. The administrative model where making exceptions was the rule by which French civil servants managed to control interests and to promote accommodation has had to make way for the regulatory model, where exceptions are illegitimate. This has been most apparent in the agricultural sector in the context of the GATT talks. Vegetables on the highways and pigs in the street, however, have not been as effective as they have in the past

at gaining anything other than verbal concessions from the French government, because the government is no longer as free to bend, or not, to the pressures of confrontation.

Not that the government hasn't tried to continue in its old ways. In fact, the ministries have sometimes been remiss in implementing EC directives in the manner that the EC regulatory model demands. As one set of commentators put it already in 1988, the French administration, following Tocqueville's maxim, "has not dedicated itself to the consistent implementation of policies."[70] The French government has been chastised by the European court for making countless exceptions to rules that, in the view of the EC, allow none.

The regulatory model, moreover, has complicated life generally for the bureaucracy, since it results in two different systems of law: the old administrative one and the new regulatory one. Thus, the French constitutional scholar Guy Braibant has remarked on the inequities that result, given the two different processes, with different avenues for recourse[71]--a bit like the differences in the United States between cases taken up by the Federal Trade Commission, which go through an administrative law process before any appeal can be made to the courts, and those taken up by the Justice Department which go directly to the judiciary.

French government ministries are not the only ones having difficulty with the regulatory model in the national context. The quasi-independent regulatory bodies that increasingly administer policy is also something quite new for French businesses, and one that they are finding a hard time getting used to. The more arms' length relationship demanded by these bodies often leaves business people even more upset than they had been in the past by the traditional, near symbiotic relationship with the ministries, since at least there they were likely to be able to arrive at some kind of accommodation, if they could not get their way altogether. Thus, for example, the CEO of the privatized television station, TF1, found that the regulatory body set up to monitor television and radio simply substituted increased government regulation for government ownership, and complained that "the regulations have become more and more constraining to the point that they appear edicted to make it impossible for us to function."[72]

The new regulatory model, in short, has upset the traditional model of policy implementation, and in many cases further weakened the traditional business-government relationship. This, together with the primacy of the EC in policy formulation and the new access of business at this level, has ensured that business is more independent from government than it has ever been. Such independence, moreover, has only been enhanced by the third order effects of European integration, which involve the choices that governments have made in seeking the ensure that French business is ready for the competitive challenge of Europe.

Meeting the Challenge of European Competition: Third Order Effects on Government and its Relationship to Business

The third order effects have received the least attention from scholars focused on Europe and its impact, but are probably as important with regard to the changes in government and its relationship to business. These effects are the results of the choices governments have made (or not made) in response to the competitive challenge constituted by the drive toward European integration and by the implementation of EC directives. Such choices encompass not only the industrial policies of the Mitterrand years, but also many of the choices taken by governments from the very beginning of the European Community (i.e., the very decision to join the EC).[73] The most significant choices, however, are the contemporary ones. And although it would be an exaggeration to insist that European integration was <u>the</u> reason for governments' policy choices, it was certainly <u>a</u> reason, and often one of the more compelling ones.

During the Mitterrand years, these choices all involve decisions about the levels of state ownership and control of business necessary to meet European competition, and are embodied in the policies related to nationalization between 1981 and 1986, to privatization between 1986 and 1988, to the ni-ni period of neither nationalization nor privatization between 1988 and 1991 when state-owned firms traded shares in one another, the post ni-ni period when private firms could acquire up to a 49% stake in public ones between 1991 and 1993, and the most recent return to privatization. Their effect has been to ensure that after an initial period of increased state ownership and control through nationalization which better prepared French business to meet the challenge of European competition, French governments under Mitterrand progressively increased public enterprise autonomy in order to put French business on an equal footing with their private European competitors.

Much of the Socialist government's industrial policies of the early eighties can be understood as the response to the problems for French business created by the drive toward European integration. These began primarily in the late sixties with the final removal of all protectionist barriers. This opened French business up to a competition for which it was basically unprepared. French companies soon discovered that they could no longer depend upon producing more; they had to produce more competitively, with better quality goods at lower prices, in order to meet the challenge of foreign manufacturers not only in foreign markets but also in the domestic market.[74] French business, however, was doing little to meet that challenge. From the mid-1970's to 1981, foreign penetration in basic manufactured goods rose from 25 to close to 40 percent. Moreover, while the costs of salaried workers was going up, investment was going down: between 1974 and 1983, the rate of investment fell from 14% of the GDP to 12%. Although some of this can be blamed on external economic constraints such as the oil shocks of 1974 and 1979 and on internal political weaknesses such as the failure of governments to respond forcefully enough with adequate macroeconomic policies, the fault also rests with business.

French businesses in the seventies suffered from three handicaps by comparison with their European competitors: heavier debt loads, insufficient investment and research, and defensive reactions to the economic crisis. French business' level of indebtedness was double that of the Germans (4% of added value by contrast with 2%).[75] Investment also suffered from the high debt load and from business' focus on dividends, while investment in research and development in particular experienced negative growth of -4% per year from 1968 to 1974 and zero growth from 1974 to 1981.[76] In addition, instead of reorienting their efforts toward growth sectors of industry, French governments increasingly focused their efforts on propping up the declining sectors. Finally, because key sectors of industry such as steel were convinced that the problem was conjunctural rather than structural, they had not taken the necessary steps to restructure or streamline operations, or to create diversified industrial groups (as the Germans had done).[77] Instead, the steel industry consistently demanded, and received, subsidies from government to the tune of 100 billion francs in exchange for maintaining employment and not closing outdated plants.

French scholars themselves were relatively late at recognizing the potential effects of this on the economy.[78] The French government even later. Under Giscard d'Estaing, the politique de créneaux, while successful in increasing the international competitiveness of industry leaders in certain sectors or "niches" of the international economy, caused the economy to lose a significant share of its domestic market and to waste a lot of money on products that couldn't sell and on firms that couldn't compete on the international market. In the meantime, it was becoming apparent to businesspeople and economists alike that another kind of strategy, a politique de filières focused on increasing the size of firms while integrating them vertically along lines of production, was the only way to ensure competitiveness.[79]

The Socialists, committed as much to European integration and meeting the challenge of international competition in a market economy as they were to making a break with capitalism (at

Columbia Revisited:
Interpersonal Communication, Mass Communication and Voting
- Evidence from a Study of West and East German Voters -

by
Rüdiger Schmitt-Beck

Centre for European Social Research
University of Mannheim
D-68131 Mannheim
Germany

Paper prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, Washington, D.C., September 2-5, 1993; Panel 8-10: Context and Group Mediation in Voting Behavior

1. Introduction

When voters make up their minds about which party to vote, for they rarely do so in a social vacuum. Rather, they are surrounded by and embedded in complex communicative contexts that expose them to political messages more or less regularly and more or less intensely. For voters, such communicative environments fulfill the important function of mediation. They provide them with links to the distant, complex, and ambiguous world of politics beyond the realm of their direct experience. Insofar as politics becomes an object of the voters´ preception, it is necessarily a mediated experience (Lippmann 1949; Nimmo/Combs 1990).

Two types of communication channels are of predominant importance for the process of political intermediation: the networks of interpersonal communication, linking individual voters to relatives, friends, neighbors or colleagues at the workplace, and the system of mass communication. For electoral research these objects are not new. Almost half a century ago they were central targets of the Columbia School´s seminal studies (Lazarsfeld et al. 1968; Berelson et al. 1954; Katz/Lazarsfeld 1955). However, this research perspective did not lead to a continuing strand of electoral research. Instead, for the ensuing decades this particular area of political sociology has been dominated, on the one hand, by the narrowly individualistic perspectives of the Michigan School, and the Rational Choice approach, which tend analytically to deprive voters of their communicative contexts, and on the other hand -- particularly with respect to European voting behavior -- by the cleavage approach that tends to link the political behavior of individuals directly to social background variables, thereby ignoring the mediating institutions which necessarily intervene between these two dimensions (Knoke 1990: 29-39; Beck 1991: 372).

Certainly it would be inappropriate to propose that the importance of instituions of intermediation has been ignored by electoral research altogether. In particular the effects of mass communication on voting behavior have been studied extensively (Kraus/Davis 1976: 48-109; Schönbach 1987; Ansolabehere et al. 1991). Some, although much less, research has also been devoted to the study of interpersonal communication networks and their meaning for political attitudes and behavior (Sheingold 1973; Knoke 1990: 29-56). Very rarely, however, have researchers engaged in investigations of interpersonal and mass communication simultaneously (Reardon/Rogers 1988).

This one-sidedness of the study of political intermediation processes entails specific shortcomings. Erbring et al. (1980: 18) criticize the tendency of (mass) communication research to view society exclusively as audience of the mass media and to neglect that political orientations may have other sources as well, such as interpersonal communication. When studying effects of the mass media, it should be taken more into account that their audience is not an amorphous ´mass´ of atomized individuals but a society structured by complex networks of many kinds of communication relationships (Chaffee 1972: 114; Schenk 1977: 120; Knoke 1990: 54).

Research on political communication in the networks of everyday interaction, on the other hand, must be aware that as an intermediary institution these are still located very close to the individual and therefore themselves need further links to get into touch with the distant world of politics. In other words, as an intermediary institution they cannot bridge the gap entirely between the micro-level of the individual citizen and the macro-level of the political system. Furthermore, the idea proposed by the Columbia studies that the majority of voters do not get into contact with media messages directly but rather through the mediation of opinion leaders -- i.e., the famous model of the two-step-flow of communication (Lazarsfeld et al. 1968: 151-152) -- no longer seems appropriate. Instead there is reason to believe that today´s ubiquituous media also reach their audiences directly. This, again, has consequences for interpersonal communication: "Interpersonal interaction today takes on a new dimension, growing out of the fact that millions of people can receive the same message at about the same time." (Chaffee 1972: 95-96) Thus, when studying interpersonal communication it seems appropriate not to leave the information flows of mass communication aside.

A more recent conceptualization of interpersonal communication and mass communication argues for a view of their relationship as being reciprocal and partially complementary. "Social communication consists of an ongoing series of transactions between people and the channels that bring them information, not a finite competition between these channels. The traditional concept of a directional ´two-step´ or ´multi-step´ flow fails to capture the cyclical and reciprocal nature of this process. The most likely ´effect´ of communication (...) is further communication." (Chaffee 1986: 76) According to this view, the search of individuals for information starts when the information that they already have at their disposal is ambiguous or contradictory. Additional information in such a situation has the function of a reality test. "When we seek information it is often for corroboration or comparison with prior constructions of reality, and we seek it through those channels that are most accessible to us and are likely to have something additional to say on the subject. Whether these are media or interpersonal channels depends largely on the topic, timing, and immediate accessibility." (Chaffee 1986: 75-76)

However, interpersonal and mass media channels are each characterized by a certain specialization. The strength of the mass media consists primarily in their ability to distribute information about facts and events distant from the individual´s everyday experience, whereas interpersonal communication is particularly effective in transmitting meta-information about this information. While mass communication contributes primarily to the construction of knowledge structures, interpersonal communication supplements this plain knowledge with interpretations. In other words, it helps to attain a sense of its meaning through the addition of opinions and evaluations (Merten 1982: 38).

In the context of the international research project "Comparative National Election Project (CNEP)" an attempt is being made to revive the long neglected research agenda of the Columbia School by studying interpersonal and mass communication simultaneously. Paul Allen Beck (1991) has recently published an analysis of the joint intermediation environments of Ohio voters in the 1988 presidential election. The present paper is an attempt to replicate this study with data on German voters. It compares West and East German voters at the first all-German general election of 2 December 1990.[1] The aim of this study is to investigate two dimensions of the interpersonal and mass media intermediation environments of German voters: the degree to which they are *exposed* to these two types of intermediaries and the *nature of the political messages* which these mediators convey to them.

2. Interpersonal Intermediation Environments

2.1. Exposure

The interpersonal intermediation environments of German voters have been identified empirically as egocentric networks (Pappi 1991; Burt 1984), that is, they were reconstructed according to how they were perceived by the voters themselves. Since it is of interest how political communication fits into voters´ everyday communication with persons of their immediate social surrounding, the networks have been generated by means of a thematically nonspecific name generator. Respondents were asked to name up to four persons with whom they had discussed "important

1 This paper was written in the context of the project "Comparative Election Study - General Election 1990 in West Germany and East Germany". Principal investigators are Max Kaase (Mannheim), Hans-Dieter Klingemann (Berlin), Manfred Küchler (New York) and Franz Urban Pappi (Mannheim). The project is directed by Rüdiger Schmitt-Beck and Ingo Koßmann (both Mannheim). Also working or involved in the project are Rolf Hackenbroch (Berlin), Rainer Mathes (Frankfurt), Barbara Pfetsch (Mannheim), Peter Schrott (Mannheim), Katrin Voltmer (Berlin), and Bernhard Weßels (Berlin). The analyses presented in this paper are based on data drawn from the first two waves of a three-wave panel survey, based on random samples of the West and East German electorates, respectively. Interviews were conducted from 3 October through 16 November 1990 for the first wave, and from 10 November through 1 December 1990 for the second wave. In the first wave 1340 interviews in West Germany and 692 interviews in East Germany were completed (response rate for West German sample, 68%; for East German sample, 71%). Due to an unusually high panel mortality, in the second wave only 449 interviews in West Germany and 253 interviews in East Germany could be completed (panel mortality for West German sample, 66%; for East German sample, 63%).

matters" during the past six months. In a second step they were asked how frequently they were discussing political matters with these persons. Finally, it was asked whether there existed an additional person with whom they talked about political matters. This question´s aim was to make sure that "weak ties" (Granovetter 1973) of a specifically political character were also included in the egocentric networks.

As Table 1 shows, every sixth West German and every fifth East German did not respond to the network questions. Very few respondents -- 4% in West Germany and 8% in East Germany -- named as many as five discussion partners. On average about two persons were named by both West German and East German voters. The rank order in which network partners were named reflects the density of contacts. It was on average highest with those named first and lowest with those named as fourth or fifth persons. In general, contacts are are more frequent among East Germans than among West Germans, indicating a generally higher density of social contacts in Eastern part of the country. In both regions of Germany contacts with three-fourths of the network partners take place at least once a week, that is, the egocentric networks of all German voters are composed mainly of persons interacting quite regularly with one another. However, fewer West Germans than East Germans talk to their contact persons as often as almost every day (Table 2).

The one exception to this rule, where contact frequencies are substantially higher than average, are the network partners on rank 1 -- these are often spouses (Table 3). Other very important contact partners are relatives, followed by work colleagues, both in East Germany and, somewhat less so, in West Germany. The reverse is true for friends, who are also generally mentioned frequently, but remarkably less so in East Germany than in West Germany. Voluntary associations as well as the neighborhood, on the other hand, seem to be not very important as contexts that stimulate interpersonal exchange.

Regarding politics, East Germans, again, are characterized by denser contact structures (Table 4). Not only do they talk to each other more often -- if they have contact with each other, they also thematize political matters much more often. While many West German voters have quite a number of partners with whom they never discuss politics -- although apparently considerably less so than American voters (Beck 1991: 374; Schenk 1993: 262) --, East Germans do not. At the same time, the various network partners of East Germans differ less with respect to the incidence of political discussions, whereas among West Germans these tend to concentrate more clearly on the additional political communication partners on rank 5, on spouses, and on colleagues (Table 5). Taken together, prior to the first all-German general election of 1990, the everyday life-world of voters in East Germany was much more politicized than that of their West German counterparts. Doubtless this is at least in part a period effect reflecting the revolutionary political and social changes that East Germans had to cope with following the breakdown of the Socialist regime in the former GDR. For lack of comparable data from "normal" times, it is not possible to determine whether in West Germany everyday life in its political dimension simply carried on as normal or whether the rates measured there were also unusally high. The one thing that is clear, however, is that in the "old" Federal Republic, that is, in West Germany, the political turmoil of 1989-1990 did not penetrate everyday life to a comparable depth.

What determines how strongly voters expose themselves or are exposed to political communication in the context of their everyday contacts? The answer to this question differs in part with respect to the type of relationship involved (Table 6).[2] However, there are also variables which influence the intensity of interpersonal political communication in a very general way. Prominent among these is the level of political competence. Voters with high political self-esteem clearly tend to discuss politics more than voters who feel themselves to possess less political

---

2 The analysis is based on voters with at least one network person named. Higher scores on independant variables are assigned to higher educated, males, elderly, politically interested, politically competent (factors scores of principal component based on four items about political self-esteem), strongly ideological voters (distance of self-placement from center of left-right-scale), voters of parties in government, voters with high average contact frequencies, and voters with many network partners named.

knowledge. In contrast, with the exception of friendship ties, higher levels of political interest lead only in West Germany to heightened frequencies of political exchange. This can also be attributed to the unique situation in East Germany where political interest in the year of the country's unification was generally very high and therefore varied only little. The West German voters thus correspond to the pattern described by Beck (1991: 375-377) for American voters.

Moreover, voters who generally meet their network partners often talk more about politics with their colleagues. Among West German voters only, high contact densities also enhance political exhange with spouses, neighbors, colleagues, and friends. Remarkably, women still tend to view their husbands as the most important partners for political discussions, whereas men find their partners more often outside the familiy. Here again, German voters reveal the same pattern as American voters. Among West German spouses, in addition, the intensity of political discussions rises with age, and among West German colleagues with higher levels of formal education.

2.2. Political Concordance and Discordance

This section considers the political preferences of everyday communication partners as perceived by the voters. To what kind of political messages are voters exposed when they engage in political discussions with their spouses, relatives, colleagues, or friends? Is interpersonal communication dominated by concordant relationships, that is, do voters interact mostly with persons of the same political persuasion? To what degree are voters confronted through their interpersonal communication with discordant standpoints that contradict their own position?

According to the rule that "like talks to like" (Chaffee 1972: 99), one would expect interpersonal intermediation environments to provide voters more often with support for than with challenges of their own political preferences. Table 7 demonstrates a confirmation of this assumption. Generally the egocentric networks of West and East Germans are dominated by concordant relationships.[3] They function more often as sources of support than of challenges for the voters' political dispositions. However, some important qualifications apply as well. Firstly, the interpersonal intermediation environments of East German voters seem to be less often characterized by concordance and more often by discordance than those of West German voters. Secondly, concordance levels between spouses are by far the highest; in two of three couples both partners intend to vote for the same party. To the degree that voters engage in political exchange beyond the narrow boundaries of their core families, they must cope increasingly with party preferences other than their own. Since such behavior is more characteristic of men than of women, these typically face more political challenges in their personal contacts. Women, on the other hand, should be expected to stick more stably to their political dispositions. In comparison, the concordance levels between discussion partners at the workplace are rather small. In this context, that seems to be almost as important as the core familiy with respect to the frequency of political discussions, voters are confronted relatively often with discordant views.

In order to provide an overall impression of the interpersonal intermediation environments to which German voters are exposed, measures of overall concordance and discordance are required. Therefore two indices have been constructed by dividing, for each voter, the sum of his concordant or discordant relationships to network partners by the sum of all his concordant, discordant, and neutral relationships. A value of 1.0 stands for a fully concordant or discordant interpersonal intermediation environment and a value of 0.0 for an interpersonal intermediation environment without concordant or discordant relationships. Also in the overall analysis, the predominant impression is one of concordance (Graph 1).[4] Again, this applies more to West Germans than to East Germans. Majorities of 38% of voters in West Germany and 31% of those in

---

3 In condordant relationships both voter and network partner vote for the same party (as perceived by voter), in discordant relationships the network partner votes for a party other than the one favored by the voter. If voter reports that his network partner is a non-voter or if he does not know about the network partner's vote intention, the relationship is classified as neutral.

4 The analysis is based on voters with at least one concordant, neutral, or discordant network partner.

the East view themselves as communicating exclusively with persons of their own political affiliation. At least one-half concordant are the interpersonal intermediation environments of 62% of West German and 54% of East German voters.

Remarkable, however, is, on the other hand, that about one-quarter of West German voters and one-third of East German voters do not derive political support from their contact networks. Among these voters´ contact partners, no-one shares their party preference. However, this does not necessarily imply that their political orientations are under the pressure of discordant interpersonal communication. Not more than 15% of East German and 7% of West German voters are exposed to fully discordant interpersonal intermediation environments (Graph 2). Roughly one-half of the East German and two-thirds of the West German voters are entirely untroubled by discordant views originating from their personal contact networks.

The analysis of the full interpersonal intermediation environments again demonstrates that in their everyday contacts East German voters are exposed to less concordance and more discordance than West German voters. Probably this observation is attribuTable to the fact that in 1990 the German party system had been only freshly transferred to East German voters. It therefore had not had the time to take root in the electorate of the former GDR as firmly as it is anchored in West German society where it has developed over four decades. Consequently, party loyalties in East Germany showed fewer clear-cut, and cross-cutting loyalties among communication partners were more numerous. Since German voters were more often challenged by discordant points of view and less often buttressed by concordant messages, there was certainly a greater potential for short-term changes in voting intention prior to the election of 1990. One can only speculate whether this constellation is at present still characteristic of the East German electorate.

Under what conditions are interpersonal intermediation environments concordant and under what conditions discordant? Part of the answer to this question relates to the specific opportunity structure of the German party system (Table 8).[5] Voters favoring one of the large parties (CDU/CSU or SPD) have much higher chances of communicating predominantly with persons sharing their preferences than adherents with one of the small parties (see also Pfenning et al. 1989). Ideological voters also interact more with partners of their own position than moderate "middle-of-the-road" voters. While these correlations hold both for West and East German voters, the affiliation with either a party in government or an opposition party makes a difference between them. In West Germany those preferring one of the opposition parties communicate more often with concordant contact persons, whereas in East Germany the same is true for supporters of one the parties of the government coalition. Contrary to a recent finding of a West German sample reported by Schenk (1993: 266), in our study frequent political discussions do not appear to enhance the degree of political congruency between West German network partners, but only that among East Germans.

3. Mass Media Intermediation Environments

3.1. Exposure

Not only do East Germans engage more often than West Germans in discussions with their network partners, but they also expose themselves more intensely to the other important institution of political intermediation, the mass media system (see also Kiefer 1992). Drawing on media system dependency theory (Ball-Rokeach 1985), this pattern also may be interpreted as period effect reflecting the deep social and political changes to which East Germans were subjected during the year of German unification. Roughly three out of four West German, but nine out of ten East

---

5 The analysis is based on voters with at least one concordant, neutral, or discordant network partner. Higher scores are assigned to voters of large parties and to voters with high average frequencies of political discussions (other independent variables: see footnote 2). As dependent variable an index is used similar in its logic to the index used by Beck (1991: 387, FN 6), i.e., each concordant relationship is assigned a value of 1, each discordant relationship is assigned a value of -1, and each neutral relationship is assigned a value of 0. Then for each voter all scores are summed.

German voters read a daily newspaper at least occassionally (Table 9). Furthermore, it is remarkable that much fewer East Germans than West Germans rely exclusively on tabloids whose content and style of presentation is better suited to entertainment than to information. Among East German voters 86% as opposed to only 60% among West German voters pay attention to the information supplied by the "serious" regional and national newspapers; as many as 9% in West Germany and 14% in East Germany even read two such newspapers.

Considering exposure in a more detailed way, it is also clear that East Germans use daily newspapers more intensely. Table 10 demonstrates, furthermore, how the usage patterns of tabloids differ from those of the more "serious" press with respect to each type of content. Large majorities of West and even more so of East German readers pay attention to each issue of their newspaper, whereas reading habits of tabloids appear much less regular. Generally, to pay attention to a newspaper does not necessarily imply reception of its political information, and even less so of its political commentaries and editorials. The average frequency with which such types of content are paid attention to are lower than the average frequency of newspaper reading in an unspecific sense. However, once again East Germans appear to be more attentive to any type of political content of newspapers.

Regarding the second mass media institution of interest in this study, television, it is obvious that this is the political mediator with the broadest reach. Remembering that television is a ubiquituous medium that reaches almost every German household -- with only 3% of West Germans and 1% of East Germans in our samples not owning television sets the actual penetration rates of television are only slightly overestimated -- one can conclude from Table 11 that only small minorites of German voters manage to avoid television evening news entirely. In contrast to newspapers, to which sizable proportions particularly of the West German electorate do not pay attention, television news reaches almost anybody at least occasionally. This implies that many voters devoting no time to the consumption of daily print media are nonetheless exposed to mass media political intermediation through television. With regard to general usage patterns, East German spectators appear to expose themselves more often to political information than their West German counterparts also regarding television news.

Concerning the usage patterns of the major news programs of German television presented in Table 11, two additional features deserve mention. These are due to specific aspects of Germany´s broadcasting landscape in the year 1990. For one, in West Germany the effects of the "dualization" of the broadcasting system (Schuler-Harms 1992) are quite obvious. Since 1984 Germany´s two public television systems, ARD and ZDF, have had to face the challenge of numerous private, advertising-financed channels, offering mainly entertainment programming of a mass-attraction type. These channels can be received either through subscribing to cable networks, which, however, are concentrated in the more densely populated areas of West Germany, or via private satellite dishes, which have been spreading enormously in both regions of Germany since 1989. The two private channels with the highest ratings, RTLplus and SAT1, have been included in the analysis presented here. In 1990 about 70% of the West German voters could receive at least one of these channels.[6] Within this segment of the television audience most news programs of the public channels lost a portion of their spectators. The news offered by the commercial channels, on the other hand, were obviously not accepted as an equivalent and attracted no regular audience.

Secondly, all East Germans in 1990 still could watch the two channels of the former GDR state television DFF ("Deutscher Fernsehfunk"), which was finally taken off the air by the end of 1991. Traditionally, the two West German public broadcasting systems, ARD and ZDF, had for decades reached large parts of the East German televison audience through intentional overspill (Hesse 1988). Following the breakdown of the Socialist regime by the end of 1989, additional efforts were undertaken to provide all East German television viewers as quickly as possible with the West German public channels in good reception quality. By the time of our study 85% of East German

---

6 Although these channels had by 1990 also gained a sizable East German audience through direct satellite-reception, they were not included in the East German part of our study in order not to overload the survey.

voters reported abling to watch one or both of these channels, however not always in satisfying reception quality. As Table 11 demonstrates, the opportunity to watch "Westfernsehen" (West German television) virtually drained DFF´s news programm of its audience.

Finally, with regard to the self-reported attention paid to political reports in newspapers and to television news shows, once again, the pattern of stronger exposure to mass media intermediation environments in East Germany (Table12). Tabloids reveal themselves as a medium not paid particularly strongly attention to for their political content. Aside from tabloids there is a tendency, furthermore, for newspapers to receive more attention than television news in West Germany, whereas the opposite is the case in East Germany.

Among the factors determining the intensity of exposure to mass media political reporting, as measured by its frequency, the variables of age and political interest stand out (Table 13).[7] West and East German voters pay more attention to political content the older they are, and the more they are interested in politics. These correlations apply to television news more strongly than to newspapers. The effect of age reflects at least partly the general character of television, which is a medium that attracts older persons more strongly than the younger (Comstock et al. 1978: 289-309; Kiefer 1992: 149-164). Politically competent voters also tend to expose themselves more often to the political content of the mass media. However, this relationship is clearer for newspaper readers than for television viewers. Newspapers tend to be rather the medium of the politically competent, television news the medium of the politically interested. Finally, paying attention to television news is in West Germany more widespread among voters with lower levels of formal education. It is worth noting that the profile of West German media users comes quite close to that of their American counterparts as described by Beck (1991: 382).

3.2. Political Concordance and Discordance

Normative theories of the mass media often highlight "objective" reporting through truthful representation of plain facts as a basic operating norm and one of the fundamental requirements for the mass media in liberal-democratic political systems (Severin/Tankard 1988: 212-213). Although open endorsements, as in editorials of American newspapers, are not common practice in the German media, there are content analyses that claim to identify partisan biases in the reporting of newspapers (Kepplinger et al. 1989). Furthermore, there is considerable criticism of public broadcasters accusing them of being a playground for party influences (Langenbucher/Lipp 1982). However, to what extent do those exposed to the mass media perceive political reporting as being skewed towards the direction of particular parties?

Regarding newspapers, three principal results stand out (Table 14). Similar to their American counterparts (Beck 1991: 382-384), German voters predominantly do not detect partisan trends in the reporting of the newspapers which they customarily read. The feeling that their newspapers tend to report in an unbalanced way, however, is more widespread among West Germans than among East Germans. Finally, according to the perceptions of newspaper readers, the party profiting primarily from skewed reporting is the leading party in government, the CDU/CSU. 28% of West German and 15% of East German feel that their newspaper favors this party. About one-half as many observe a bias towards the large opposition party SPD, whereas the small parties are rarely found to be supported in the newspapers. Since the German newspaper system is rather decentralized[8], and consumption is spread over hundreds of local papers, more detailed analyses of specific newspapers cannot be presented here.

However, the perceived bias of television programs can be investigated in a more specific way (Table 15). Such biases are observed less often in television than in the print media. The proportion of spectators unable to detect any political bias never drops below 60%. Nonetheless, there are

---

7 The analysis is based on voters using at least one medium (coding of independent variables: see footnote 2).

8 More with respect to the number of titles read than that of ownership (Meyn 1992: 88-104): In September 1991, 410 media companies published 1673 local newspaper editions (Schütz 1992: 75).

also some clear differences and trends. Again, as with print media, East German peceptions tend more strongly towards neutrality. However, this does not apply to the two public channels, ARD and ZDF. The aggregate similarity between East German and West German perceptions of these two channels is astounding. In both electorates, twice as many voters feel that the ZDF favors the CDU/CSU than feel that it favors the SPD. The ARD, on the other hand, is seen by roughly equal proportions of the audiences as biased towards the CDU/CSU or towards the SPD. Special cases are the West German commercial channels and the East German DFF. The private entertainment channels are obviously hard to evaluate, and in sum they appear only to very few spectators as biased. Certainly this result reflects at least partially the generally marginal role of politics in the programming of these channels. The East German television DFF continued its transmissions in 1990 with the old staff, but under a new, West German management, and adopting a new, public television philosophy (Faul 1991). As Table 15 indicates, in the view of its spectators it was quite successful -- in fact, much more so than its two West German models -- in matching the ideal of political balance upon which this type of broadcasting is based. Fewer than 10% of the East German voters felt that the DFF's reporting was biased towards one or another party.

When relating voters' party preferences to the partisan orientations which they perceive in the mass media, the regularities that appear are, once again, similar to those identified by Beck (1991: 384) for the American media users. If they perceive indeed that one of the media which they consume is biased in partisan terms, both West German and East German voters feel more often that it is in the direction of a party other than the one which they themselves prefer (Table 16). In other words, if voters do not perceive a particular medium as neutral, they tend to perceive it as discordant than as concordant.[9] This may be interpreted as one more manifestation of the "hostile media phenomen" (Vallone et al. 1985): If we assume that the media actually report in a neutral fashion, partisans tend to perceive them as being opposed to their own point of view, due to a mechanism of negative projection. The one exception where discordant relationships do not outweigh concordant relationships are the commercial channels. However, these are perceived in any case as neutral by nine out of ten viewers, so that there is little room either for concordance or for discordance.

To assess German voters' full mass media intermediation environments, indices of overall concordance and overall discordance have been developed. Following the model of interpersonal intermediation environments, these indices have been constructed by dividing, for each voter, the sum of his concordant or discordant relationships to newspapers read and/or television programs watched by the sum of all his concordant, discordant, and neutral relationships. A value of 1.0 represents a fully concordant or discordant mass media intermediation environment and a value of 0.0 a mass media intermediation environment without concordant or discordant relationships. While the interpersonal intermediation environments of voters in West as well as in East Germany are characterized more or less strongly by concordance, the mass media intermediation environments are rather typified by its absence (Graph 3).[10] Not more than one out of ten West German and one out of twenty East German voters are exposed to media of which at least one-half appear to share their own political standpoint. In contrast, more than 70% of West German voters and more than 80% of East German voters feel that not one of all the media they cusomarily consume reports in a concordant way. Occurrences of discordance, on the other hand, are only slightly less infrequent (Graph 4). No discordance originating in the mass media system is experienced by 57% of West German and by 68% of East German voters. In sum, the mass media are seen as much more neutral political mediators than voters' interpersonal contact networks. However, if a party bias is felt to be present, its direction is challenging rather than supportive.

---

9 In condordant relationships the medium (as perceived by voter) favors the party the voter wants to vote for, in discordant relationships if favors another party. If a voter perceives a medium as not being biased towards any particular party, or if he does not know which party a medium favors, the relationship is classified as neutral.

10 The analysis is based on voters using at least one medium.

No more than two variables seem to be of importance with regard to the degree of concordance or discordance of mass media intermediation environments (Table 17).[11] Voters of parties in government feel their mass media intermediation environments more often to be concordant than do voters of oppositional parties. This is due to the dominance of the CDU/CSU that is perceived in the reporting of some of the media. Moreover, in West Germany voters of the large parties derive more support than challenge from their mass media intermediation environments -- a consequence of the fact that voters very rarely feel one of the smaller parties to profit from biased media reporting. Aspects of political competence that are important determinants for the perceptions of American voters do not seem to be of relevance in Germany (Beck 1991: 379-381).

4. Joint Mass Media and Interpersonal Intermediation Environments

4.1. Exposure

The starting point of this paper was the argument that to understand more adequately the functioning of political intermediation, it is necessary to study interpersonal and mass media intermediation environments simultaneously. How do the intensities with which voters expose themselves to the two mediating institutions interact with each other? Do voters tend to specialize by concentrating their communication efforts rather on one of the two mediators while neglecting the information supply offered by the other? Or do voters differ rather with respect to the intensity with which they expose themselves to the two intermediation environments at the same time? For West German voters the answer to these questions is unambiguous: On the dimension of political exposure, interpersonal and mass communication are closely connected (Table 18).[12] Voters strongly inclined to engage in political discussions with the persons they whom they associate in everyday life also pay much greater attention to the information supply offered both by newspapers and by television. Exposure to interpersonal communication and exposure to mass communication on political matters appear in West Germany to be two sides of the same coin.

In East Germany the situation is somewhat different, however. With respect to newspapers there is also a positive correlation, although considerably weaker than in the West. That is, in the new states of the East voters frequently engaging in political discussions also tend somewhat more to pay attention to the political reports of daily newspapers. Television, on the other hand, is a clearly different matter. No relationship is found between the intensity of interpersonal and mass communication with respect to the visual medium. Voters eager to discuss political matters as often as possible do not differ from those tending to avoid such discussions in the strength of their inclination to watch television news shows.

4.2. Political Concordance and Discordance

Finally, we consider the relationship between interpersonal and mass media intermediation environments with respect to the nature of the political messages which they convey to the voters (Table 19).[13] Obviously interpersonal communication is a much more important source of political reassurance through exposure to concordant standpoints than mass communication. Since East Germans tend to perceive their media system as more neutral than West Germans, this applies even more so to East Germans. Discordant messages that challenge existing political dispositions, originate in West Germany more often from the mass media, whereas in East Germany the

---

11 The analysis is based on voters using at least one medium. Higher scores are assigned to voters watching frequently television news and to frequent readers of political reports in newspapers (other independent variables: see footnotes 2 and 5). As dependent variable an index is used similar in its logic to the index used by Beck (1991: 387, FN 6), i.e., each concordant relationship is assigned a value of 1, each discordant relationship is assigned a value of -1, and each neutral relationship is assigned a value of 0. Then for each voter all scores are summed.

12 The analysis is based on voters with at least one network partner, using at least one medium.

13 The analysis is based on voters with at least one network partner, using at least one medium. The table is based on the indices described in footnotes 5 and 11 which were trichotomized.

opposite is the case: here it is interpersonal communication that exposes voters more often to discordant positions. On the one hand this difference is due to the fact that the East German society is less clearly aligned along party cleavages than the West German, so that more discordance is transferred through interpersonal communication, and, on the other, to the mostly neutral perceptions of the mass media among East Germans.

In particular, because the media system is predominantly perceived as a neutral mediator, only a small fraction of voters find themselves in the comfortable situation of being subjected exclusively to affirmative messages (9% in West Germany, 6% in East Germany). The modal category of the cross-classification of intermediation environments is represented by voters receiving concordant messages from their everyday contact partners that remain uncontradicted by neutral mass media. This sizable segment of the electorate, some one-third of voters, can be expected to remain rather sTable in its party preferences.

On the other hand, roughly four out of ten voters are confronted with deviating political standpoints in one or another way -- a substantial potential for possible erosions of existing partisan loyalties through communication. Concerning the potential for media influences, it is remarkable that no more than one-half of those voters exposed to discordant mass media intermediation environments are shielded by the "protective cocoons" of concordant egocentric networks. Rarely, however, must voters cope with discordant messages conveyed to them through both interpersonal and mass communication and thus face massive pressure towards changing their own orientations. Roughly only one-tenth of the electorate is characterized by this precarious constellation.

5. Conclusion

The analysis of intermediation environments of West German and East German in the first all-German general election of 1990 reveals a set of regularities that in part matches the observations of Beck (1991) among Ohio voters. If voters expose themselves to interpersonal communication with relatives, friends, colleagues, or other reference persons, they receive predominantly messages that affirm their party preferences. However, the necessity to cope with less concordance and more discordance is greater, the more voters extend the range of their political contacts beyond the "cocoon" of the core family. The mass media, on the other hand, are generally perceived as neutral mediators. If party biases are detected, however, these tend to be discordant rather than concordant. Therefore, if the media are felt to be conveyers of partisan messages, they bear a potential to erode rather than to stabilize existing political orientations.

How do such perceptions of party stances of intermediation environments come about? In interpersonal contact networks one obvious answer is that they are rooted in explicit information exchange: Voters discussing politics may tell each other what party they intend to vote for. However, there is also much room for projection, so that the observations of voters about the partisan characteristics of their communication partners in the first place must be taken as expressions of subjective realities whose match with the partners´ actual political preferences is open to empirical scrutiny (Knoke 1990: 54-55). Investigating the accuracy (McLeod/Chaffee 1972: 61-63) of voters´ perceptions of their reference persons´ positions is in itself an important dimension of the study of political intermediation. Since openly adopting partisan standpoints is not common in the German media, observations of partisan biases in newspapers or television must be based on differing assessment processes. The question of why the leading party in government is so often seen as profiting from unbalanced mass media can perhaps be answered partly by referring to the massive quantitative dominance of the government in the political reporting of the media prior to the election of 1990 (Pfetsch/Schmitt-Beck 1993).

The comparison of West and East German voters demonstrates how deeply politics penetrated the everyday life of the new states´ citizens during the period of social and political upheaval which began in 1989 and will surely continue for many years to come. They engage much more often in political discussions than West Germans, and also refer much more intensely to the mass

media as sources of political information. However, while the intensity with which West Germans expose themselves to interpersonal political communication strongly parallels that of their consumption of the political content of the media, these two dimensions of political communication are less clearly connected in the East German electorate. While the frequency of newspaper use and of political discussions are also, if more weakly, positively correlated, the frequency of watching television news is not related to the incidence of interpersonal communication about politics.

Concerning the nature of the messages to which West and East Germans are exposed through political communication, one observes that in their personal relationships East Germans must cope more often than West Germans with political challenges while receiving less reassurance. In their everyday contacts they come into touch less frequently with concordant views and more commonly with discordant views. Despite partisan affinities towards West German parties, which perhaps even predate the breakdown of the GDR and the transfer of the West German party system (Bluck/Kreikenbom 1991), the new East German electorate is still more characterized by cross-cutting partisan alignments than the West German electorate, where the party system took roots over a period of four decades.

There thus exists a greater potential for political change within the East German electorate than one may expect in the context of the rather sTable West German party system. The mass media in 1990 did not appear as a counterbalancing force. The East German media were perceived by even more voters than the West German media as neutral communicators. However, in view of the fact that the medium perceived as the most neutral by East Germans, the East German broadcaster DFF, has disappeared in the meantime, voters in the East today may, in addition, be confronted with a more partisan media system. Therefore, given the tendency to perceive partisan media as hostile, the higher incidence of discordant exchange at the interpersonal level may be today supplemented with even more discordance originating from the media. Thus, chances for destabilizing electoral dispositions through exposure to intermediation environments may be even more pronounced.

Abstract

This paper evaluates the liberal hypothesis that political integration promotes peace while disintegration has the opposite effect. Conceiving of integration as a costly international commitment, we contrast this explanation with the well-established finding that democracies are less conflict-prone than autocracies. The statistical analysis of 1496 European dyads shows that foreign policy elites have to reckon with both domestic and international decision-making costs. Especially memberships in customs unions constrain governments from using force. Participation in security alliances and disintegration decisions by contrast enhance the likelihood of a conflictual outcome.

I. INTERNATIONAL COMMITMENTS AS A PACIFYING FORCE[1]

In 1866, the idea of political integration endured a severe setback. When the Seven Weeks' War broke out between Prussia and Austria, the links forged between Prussia and the members of the Zollverein were not strong enough to prevent Hanover and the South German states from taking Austria's side. As a consequence, the most ambitious integration project of the 19th century suddenly collapsed.

Like the turbulent period during the first German unification, our epoch is shaped by the seemingly opposing trends of integration and disintegration. While some governments pursue the arduous task of institutionalizing new forms of cooperation, other political entities break up and vanish, all too often accompanied by hatred and violence. The actual nexus between disintegration and militarized conflict apparently confirms an ever popular liberal hypothesis. According to functionalist reasoning, political integration in the form of memberships in international governmental organizations (IGOs) and the unification of states promotes peace. The disintegration of nations and international institutions, by contrast, has allegedly the opposite effect. David Mitrany (1966, 1975) was, of course, one of the first adherents of this "regulatory" or institutional liberalism (Nye 1988). He believed that the continuously growing network of international cooperation might gradually oust the use of military force as a means of interstate interaction. The major proponents of integration research refined the argument and spoke of the emergence of "security communities" (Deutsch 1957) and "supranationalism" (Haas 1958).

Current studies still refer to these traditional concepts, almost exclusively mirroring the Western European experience since World War II. As a consequence of this limited focus, no rigorous empirical test covering an extended temporal and spatial domain supports at present the assertion that integration and disintegration have contrasting impacts on the probability of militarized conflict. The present study tries to close this gap. Drawing on recent formal models (Bueno de Mesquita and Lalman 1992, Lake 1992, Wittman 1991), we conceive of integration as a costly international commitment that constrains governments in a way similar to democratic institutions (Morgan and Campbell 1991, Morgan and Schwebach 1992). In other words, leaders who consider employing military force must take into account negative reactions by their "partners" in a security alliance or a customs union. The threat of international punishment softens aggressive tendencies as long as war participation by one member harms the interests of other members. This perspective challenges the classic approaches which are largely non-institutional (Scharpf 1988). Typically, tradtional examinations stress the importance of societal, systemic or functionalist factors to account for the effect of political integration.

Focusing on the period between 1816 and 1980, this paper evaluates the liberal proposition statistically. Since we control for democracy and major power status, our analysis particularly allows us to show whether domestic or international constraints are more important. The multivariate logit models establish that political integration is an important decision making constraint, but only in certain areas of interaction. While cooperation in the form of costums union membership has an independent pacifying effect, participation in security alliances does not reduce the likelihood of a conflictual outcome. Exits from key IGOs also enhance the probability of a conflictual outcome.

We organize the article in the following way: The second section reviews the theoretical literature from which we deduce four hypotheses. The third section is an outline of the research design. We present the results in the fourth section. Possible extensions of our work and its theoretical and political implications are discussed in the conclusion.

---

[1] A first version of this paper has been presented at the Universities of Michigan and Florida, at the Graduate Institute of International Studies, and at the 1993 Annual Convention of the International Studies Association in Acapulco. We would like to thank Lars-Erik Cederman, Gary Goertz, Kathleen Horohoe, Simon Hug, Arie M. Kacowicz, David Singer, and Patricia Weitsman for helpful comments. Gerald Schneider gratefully acknowledges research support by the Swiss National Science Foundation (Grant No. 8210-030615).

II. THE THEORETICAL DEBATE

2.1. Early empirical studies

The impact of political integration and disintegration on the likelihood of armed conflict has been a neglected topic during the last two decades. This is in contrast to the scrutiny other liberal arguments have received, such as the interfaces between war and democracy (e.g. Bueno de Mesquita and Lalman 1992:145-177) or between trade and militarized violence (e.g. Domke 1988). There are at least two reasons why peace research did not pay much attention to the effects of formal integration. One of them is the inability of neo-functionalism to account for integration failure (Schneider and Cederman n.d.). This became already apparent in the 1970s (Haas 1975). A second source is the revival of realism which began to dominate the research agenda at the same time (Wayman and Diehl 1993).

This negligence is surprising, given the policy relevance of the integration hypothesis. Especially since the foundation of the European Community, politicians refer to integration as a guarantee of peace. Praising the proposed European Coal and Steel Community, Robert Schuman made the most lasting remark: "The solidarity in production ... will manifest that war between France and Germany not only becomes unthinkable, but physically impossible" (quoted in Poidevin 1988:195). Four decades later, French politicians used the "peace through integration"-argument to garner support for the Maastricht treaty.

This conviction was also popular among major proponents of integration research such as Deutsch, Haas and Mitrany. Two related hypotheses can be derived from their writings. The first postulate describes consequences of integration beyond the framework of a specific organization. The second conjecture is in line with Schuman's vision. It supposes that common institutions and increased communication mainly pacify the interactions among the members of an IGO. To distinguish the two arguments, our analysis speaks of *external* and *internal* effects of integration.

The conjecture about the external consequences of integration draws on the functionalist argument (Mitrany 1975:266) that the IGO system circumvents ideological and racial divisions as well as territorial frontiers. The growth in the number of IGOs and of IGO-memberships should thus exert a pacifying effect on the global system[2]. Notwithstanding the hopes of Mitrany and his followers, an early quantitative evaluation of this hypothesis led to a discouraging result. Singer and Wallace (1970:540) showed that the "amount of IGO has almost no effect on the amount of war which the system experiences." On the contrary, the creation of IGOs reaches its peak exactly when periods with high amounts of war end and people start trusting international institutions again.

While defining different notions of integration, Deutsch and his collaborators (1957:5) described the internal consequences as follows: "A security community ... is one in which there is real assurance that the members of that community will not fight each other physically, but will settle their disputes in some other way." Yet, in an indirect assessment of this hypothesis, Russett (1967:198) concluded that similar patterns of institutional membership and other forms of integration do not reduce the likelihood of war between two countries[3]. There is no statistical, but much anecdotal evidence for the related conjecture that disintegration ("unsuccessful integration") is a process which eventually ends in secession or civil war (Deutsch et al. 1957:5).

It should be noted that the rejections of the liberal integration hypotheses are theoretically and methodologically very much tied to the epoch during which they were written. As Singer and Wallace (1970:540-542) recognize themselves, a general indicator combining all IGOs is not discriminatory

---

[2] A topic which will not be evaluated within this paper is conflict management by IGOs.

[3] Russett analyzed pairs of countries which have been engaged in militarized conflicts resulting in over 100 battle-related fatalities from 1946 until 1965. The results with other explanatory variables (geographic proximity, economic interdependence, socio-cultural similarity and similarity of UN voting behavior) were alike.

enough. A second limitation is that both studies only test bivariate relationships. Finally, Singer and Wallace (1970) exclusively account for the influence of systemic variables.

2.2. Definition of integration and disintegration

The present paper uses less general indicators and applies a mixed research design, combining a longitudinal and a cross-sectional perspective. To make the notions of integration and disintegration comparable, we conceive of them as opposite events. Integration is accordingly linked to the decisions to join a core IGO or to merge completely with another state. Disintegration represents the other side of the coin, namely the dissolution of states or the exit from important international institutions. The paper furthermore distinguishes complete and limited forms of integration and disintegration. This distinction reflects the categorization by Deutsch et al. (1957) who spoke of "amalgamated" and "pluralistic" security communities. The unification and decomposition of a state are complete forms of integration; to join or to leave an IGO represent their counterparts with a limited scope.

From the viewpoint of a national decision-maker, international restrictions mainly result from the decision to cooperate regionally. In line with the idea of the loss-of-strength gradient (Boulding 1962), the influence of international obligations thus diminishes with geographical distance. In this study, we only focus on the responsibilities due to memberships in customs unions or security alliances. Participation in such core institutions diminishes state sovereignty in two highly sensitive domains, trade and security policy. In contrast to free-trade areas, customs unions oblige member states to accept one common external tariff against other nations (Viner 1961 [1950]). As the formal coordination of security policies also leads to a considerable loss of discretion, alliances create comparable commitments (Kegley and Raymond 1990). Both kinds of organizations are typically unanimity-ruled, yielding the small member nations a disproportional amount of power and creating collective action problems. As Viner (1961 [1950]:84-85) observes, free-riding was already present in the 19th century customs union: "...Prussia was obliged to share authority in the Zollverein on a substantially equal basis with at least most of the other non-enclave members, so that on major questions of tariff revision and administration Prussia with its 17'000'000 population and, for example, Brunswick, with 200'000 population, had, at least contractually, equal authority."

Since we only examine two types of IGOs, this study distinguishes between six different forms of political integration and disintegration. Table 1 summarizes these definitions.

Table 1: *Definitions of different forms of political integration and disintegration*

TYPE OF INTEGRATION	DEFINITION
Complete integration	Merger of states
Limited economic integration	Entry into customs union
Limited security integration	Entry into alliance
Limited security disintegration	Exit from alliance
Limited Economic disintegration	Exit from customs union
Complete disintegration	Dissolution of state

Mainly limited integration and disintegration are important for our question of research. This restriction is due to a common trait of complete disintegration and integration which both lead to the creation of

new states. Since such entities only gradually grow into the framework of international institutions, they might have a higher tendency to engage in militarized conflicts (Jacobson, Reisinger and Mathers 1986). According to this reasoning, it is more the age of a nation than the way this state was established that accounts for its conflict-proneness. Complete integration enhances also the capabilities which are necessary to be successful in a militarized dispute. It has simultaneously to be acknowledged that complete disintegration is more likely to create enduring rivalries than complete integration. Despite this difference, there are, however, no compelling reasons to assume that complete integration pacifies a state as long as the merger of states does not lead into the establishment of an effective global government.

2.3. Derivation of hypotheses

Both international constraints and norms might provide explanations of why limited integration might promote peace. Integration could, on the one hand, foster the evolution of a set of values and principles about how states ought to conduct their interactions. International institutions, on the other hand, possibly limit the latitude of a government so much that it cannot use armed force in an interstate dispute. This second argument is similar to the reasoning that domestic decision-making constraints influence the likelihood of war (Bueno de Mesquita and Lalman 1992, Morgan and Campbell 1991, Morgan and Schwebach 1992).

This study only evaluates the importance of international institutions, to a large extent because it is difficult to separate structural from normative explanations[4]. Our institutionalist perspective starts with the finding of the neoclassical theory of the state that integration lowers interstate transaction costs (North 1981). In a recent contribution, Wittman (1991:129) develops this basic insight further to explain the relationship between integration, disintegration and militarized conflict. He observes that improved international organization reduces both interstate transaction costs and the threat of war. As intrastate transaction costs simultaneously grow, the size of states diminishes. Similarly, Lake (1992) argues that the costs to control state rent-seeking are higher in autocracies than in democracies. This should lead to a more expansionist and conflictual policy by the former type of regime.

We adopt a pluralist conception of the state and perceive governments as the crucial actors in foreign policy-making (Schneider 1993, Schneider and Cederman n.d). The second important assumption is that both domestic and international constraints influence a regime[5]. Domestically, governments gain or lose support when opting for a specific position. Depending upon the degree of democratization, they have to take into account the attitudes of their own constituents. As long as integration promises welfare gains, some interest groups might wish to deepen the permanent links with other states. Internationally, governments have to reckon with reactions from other states if their sovereignty is permanently limited through the membership to core international communities. Fearing the negative effects international violence might bear on their own country, leaders punish a government pursuing a defiant course in an interstate crisis.

We summarize this argument in the first hypothesis.

---

[4] Axelrod's (1986) evolutionary approach to norms shows for instance that institutional and normative explanations are not mutually exclusive. Because sanctioning is the crucial evolutionary mechanism, norms cannot evolve without some minimal institutional framework in his analysis. The option to use retaliatory force and therefore the threat to punish aggression may also support other norms (Bueno de Mesquita and Lalman 1992, chapt. 4) unless the "dovishness" of all parties is common knowledge. For a general discussion of norms see chapters 10 and 11 in Coleman (1990).

[5] In a recent essay, Starr (1992) attributes the emergence of security communities solely to the pacifying effects of the democratic norm of dovishness.

Hypothesis 1:
States which are members of a costums union or a military alliance are less likely to employ force in their interactions with another nation.

Nevertheless, there are some reasons to suspect that the link between integration and the likelihood of armed conflict is more complex. The first one is the distinction between internal and external effects of integration. We assume that members of international communities rarely use militarized force against each other. By contrast, the reluctance to engage in armed violence should be smaller in a confrontation with an internationally uncommitted state. This study accordingly distinguishes between *integrated* dyads (both states belong to an international organization) and *nonintegrated* dyads (at least one state is not a member of an international organization). Cases where both states belong to the same institution represent a subset of the integrated dyads.

We derive our second hypothesis from the far from trivial finding that democracies rarely fight each other, but often use military force in conflicts with non-democracies. According to the game-theoretic model by Bueno de Mesquita and Lalman (1992:145-177), this divergence results from the lack of confidence democratic governments have when they face an authoritarian counterpart. This uncertainty drives them into launching preemptive attacks against presumed aggressors. If both sides are democracies by contrast, they can be almost completely sure that the other side is a dove because of the costs the use of force incurs domestically.

International commitments should have the same effect, at least as long as they urge a government to share power with other leaders to a considerable extent. Based on the analogy to domestic cost, a second hypothesis is put forward:

Hypothesis 2:
Two internationally committed governments are less likely to use military force against each other than dyads with at least one internationally uncommitted state member.

Important policy shifts by a government require the tacit or formal consent provided by the IGO to which a state belongs. Shortcuts to the enterprise of building such a broad consensus are costly for members of core institutions. Bypasses can be accomplished if a government liberates itself from possible international pressure and abrogates its obligations. Breaking out of an international community signals that a state no longer cares about former commitments.

This leads to a third hypothesis which construes a relationship between disintegration decisions and the likelihood of a conflictual outcome. This conjecture allows us to test whether disintegration and integration have opposite effects.

Hypothesis 3:
States which have undergone limited disintegration are more likely to experience a conflictual outcome than other states.

It has to be acknowledged that both customs unions and alliances are no perfect safeguards. The 1866 breakdown of the Zollverein is an illustration of this imperfection of the former type of organization. With regard to alliances, Sabrosky (1980) showed that states often break their commitments and use force against their presumed partners. A more recent examination evinced a curvilinear relationship between the degree to which such "norms" were considered binding and the amount of war in the state

system (Kegley and Raymond 1990:226-232).

However, the effects of integration and disintegration on the likelihood of reciprocated armed conflict seem to differ from one policy domain to another. It seems feasible to assume that memberships in a regional economic IGO confine governments more than those in a security community. This supposed divergence derives from one of the very justifications to build up alliances, namely the use of force.

Hypothesis 4:
Members of formal alliances are more likely to engage in a militarized conflict than members of a customs union.

2.4. Other potential causes

Outside of the sphere of integration and disintegration, other potential factors might influence governments in their decision whether to use militarized force in an interstate crisis. In our analysis, we control the effects of democracy and power status.

The inclusion of a variable distinguishing between democratic and non-democratic regimes enables us to assess whether domestic or international costs are more important as moderating sources. The related empirical tests should accordingly evince whether the Waltzian "second image" or the "second image reversed" (Gourevitch 1978) is more important for the problem under consideration. As the literature on the primacy of either national or international sources of foreign policymaking is mainly speculative, there is no general evidence supporting either of the propositions (Schneider 1993). To compare the influence of domestic decision-making structures and international commitments requires that the predictor variables are not identical. Such a juxtaposition seems possible because not all integrated states are democracies.

The second control variable permits us to evaluate whether the status of a nation outweighs either domestic or international decision-making costs. We assume that major powers with their far-flung interests have the possibility to disregard international pressure.

III. RESEARCH DESIGN

3.1. Temporal and spatial domain

Our theoretical argument suggests that political integration lowers the likelihood of a conflictual outcome. Disintegration on the other hand should enhance the propensity of a state to use force. We test the integration hypotheses and the conflicting propositions within the customary temporal domain of the Correlates of War project, beginning in 1816 and ending in 1980. The spatial domain is limited to integration and disintegration between members of the interstate system. There are two main reasons why the cross-sectional analysis only refers to European dyads[6]. First, the idea of political integration has been most prominent in Europe. Second, the data collection for one continent alone is very costly.

[6] Our coding rules for the inclusion of a state in the data set are identical with the decisions by Bueno de Mesquita and Lalman (1992). The Ottoman Empire and Turkey as its successor state are thus members of the European system throughout the whole period under consideration, the United States since its engagement in World War I following the sinking of the Lusitania in 1916.

3.2. Methods of data analysis

The analysis proceeds in two steps. Before testing our hypotheses, we first describe the occurrence of armed conflict and integration and disintegration decisions. In this descriptive section, all variables are aggregated at the system level. This coding rule is based on the substantial problem of choices in disputes involving more than two states often not being independent (Bueno de Mesquita and Lalman 1992:281-282).

In accordance with Bueno de Mesquita and Lalman (1992), we test our hypotheses on the population of both nondisputing and disputing dyads. The inclusion of randomly selected pairs of nondisputing states allows us to account for the decision of a government to respect the status quo in its relations with another administration (for a discussion of this research strategy, see Achen 1993). The analysis includes 555 instances where two European states were engaged in a militarized dispute with each other. In addition to disputing dyads, we randomly selected 941 cases of nondisputing dyads. This sample represent the population of more than 90'000 nondisputing events. The combined data set of events and nonevents thus consists of 1496 cases. We call the state which takes the first step "nation A" or "initiator." The second-moving state is referred to as "nation B" or "target."

3.3. Definition of the outcome variable

The outcome variable is dichotomous. It contrasts conflictual and peaceful outcomes of dyadic interactions. We code all instances as 0 where the members of a dyad accepted the status quo in a given year or reached a negotiated outcome after one state issued an initial demand. The classification 1 pertains to cases where one side violated the status quo and no peaceful settlement was possible.[7] The source is an updated version of the Militarized Interstate Dispute data set[8].

3.4. Definition of predictor variables:

Limited security integration: To test the first hypothesis, we code whether a state is a member of a core institution or not. A state is considered to be integrated in the realm of security policy if it belongs to a formal alliance. Data are taken from an update of the Correlates of War formal alliance data set covering the period from 1816 to the present (see Small and Singer, 1969, for a description of the original alliance data set).

Limited economic integration: We used data partly from the IGO data set (Wallace and Singer 1970) to determine whether a nation makes part of a customs union. Since this data set does not include the German and Austrian Zollverein of the 19th century[9], we had to resort to diplomatic histories (e.g.

---

[7] The categories refer to the outcomes of the International Interaction Game (Bueno de Mesquita and Lalman 1992) which are operationalized according to a six-point scale describing the actions of the initiator and the target nation in their relationship with each other. The outcomes represent combinations of the levels which nation A and B reach in their interactions with the other side. *BIGWAR* requires that the battle related fatalities of both sides amount to more than 1000 deaths (level 5 for nation A and B). *All wars* includes instances where both sides use some military force (at least level 4 for A and B). *Capitulation* occurs when one side does not reciprocate the use of force by the other nation. Capitulation by B (A) thus requests level 4 or 5 by A (B) and less than level 4 by B (A). *Acquiescence* describes situations where one state does not respond reciprocally to a level 2 or level 3 action by the other nation. Level 2 steps are demands with no subsequent actions whereas level 3 moves require that one side threatens the other. Level 1 finally stands for cases where the target does not respond to the escalatory moves by the other state. *Negotiations* occur when levels are equal, larger than 0 and smaller than 4. *Status quo* stands for the non-disputes where both states choose level 0.

[8] For a description of the coding rules see Jones (1991).

[9] The 19th century prototype of a customs union did not fulfill all criteria which were valid in this data set. To qualify as an IGO (see Wallace and Singer 1970), an organization must (i) consist of at least two system members, (ii) hold plenary

Henderson 1984) and a treaties collection in the appendix of Viner (1961 [1950]) to assess the memberships during this period. In addition to the early Austrian and German customs unions, we also include the European Community, the BENELUX and its 1921 predecessor convention between Luxembourg and Belgium.

Limited security disintegration: Disintegration only counts as a signal to other states when the related actions do not lie further back than five years. We compare the results received with this indicator with two operational codes looking at time spans of ten and one years respectively. The data source is the alliance data set.

Limited economic disintegration: A state undertook a limited disintegration decision when it left a customs union within the last five years. Alternative indicators again refer to temporal frames of one and ten years. The data are derived from the same source that is used for the integration variable.

Democracy: To determine whether a state is a liberal democracy we rely on the list of liberal democracies by Doyle (1986).

Power status: The power codification of the Correlates of War project (Small and Singer, 1982) establishes whether a state is a great power. Within the temporal domain of this study, the following nations states qualify as major European powers: United States (1916-1980); United Kingdom (1816-1980); France (1816-1940; 1945-1980); Germany (1816-1918, 1925-1945); Austria-Hungary (1816-1918); Italy (1860-1943); Soviet Union/Russia (1816-1917, 1922-1980).

IV. THE IMPACT OF INTERNATIONAL CONSTRAINTS

Integration and disintegration in the global system: Before delving into the statistical tests, we intend to describe how much the different forms of integration and disintegration changed over time. Event counts show that the growth in the number of the related decisions has been far from uniform during the time under consideration. Geographically, however, integration and disintegration has been largely a European phenomenon in the period under examination.

This is especially the case for complete integration and disintegration[10]. Eleven of the thirteen unifications which took place globally between 1816 and 1980 are related to the integration of Italy and Germany. The 35 disintegration cases are more evenly distributed over the whole period. This form of territorial change was most frequent in 1918 when nine entities separated from larger units.

The link between systemic change, disintegration and integration is also obvious in the realm of security cooperation. The interstate system experienced higher numbers of both exits from and entries into alliances before and after the two World Wars as well as in the most significant period of decolonization in the early 1960s. Economic integration is not so closely linked to the occurrence of systemic changes. Some realignment in the customs union system took place during the first half of the 19th century when the organization led by Prussia grew at the expense of some other unions or when this regional hegemon went to war against other German states (Seven Weeks' War).

Conflict as a function of integration type: The statistical analysis is directed towards disputing and nondisputing European dyads. Of these 1496 pairs of nations, 941 are nonevents, representing the decision to live with the status quo. 69 of the 555 disputes ended in negotiations.

Security integration is more frequent than economic integration. Of the 1496 initiating states, 944

---

sessions at least each decade (iii) establish a permanent headquarter arrangement, (iv) have been created by a formal instrument of agreement between governments of national states, (v) select its own membership and (vi) be serviced by administratively distinct secretariat personnel.

[10] Data are taken from the collection of territorial changes by Goertz and Diehl (1992). Instances of complete integration and disintegration correspond to their categories of unification and secession respectively.

belonged to a formal security alliance. By contrast, 166 were members of a customs union. While 871 of the second-moving nations had committed themselves to other states militarily, only 149 conformed permanently to the rules of a customs union. 572 initiators and 597 targets were democracies. 545 of the former type of states qualified as major powers. Only 413 target nations belonged to the same category.

To assess the impact of different forms of integration and disintegration, we first conducted different bivariate tests. Table 2 shows the likelihood of certain dyads experiencing militarized interactions as a function of different types of integration.

Table 2: *Likelihood of a conflictual outcome as a function of integration dyad type (bivariate logi regressions, N=1496)*

Predictor variables	**n**	**Parameter**	**Likelihood**	**Constant**	**Loglikelihood**
No alliance members in dyad	272	-0.40** (0.15)	0.67	-0.66** (0.06)	1879.27
One alliance member in dyad	633	-0.10 (0.11)	0.91	-0.69** (0.07)	1885.68
Both states alliance members	591	0.33** (0.11)	1.39	-0.87** (0.07)	1877.83
Member of same alliance	219	0.26 (0.15)	1.29	-0.77** (0.06)	1883.59
No customs union member	1043	0.63** (0.13)	1.88	-1.19** (0.11)	1861.07
One customs union member	358	-0.60** (0.14)	0.55	-0.60** (0.06)	1867.03
Both states c. u. members	95	-0.44 (0.25)	0.65	-0.44** (0.06)	1883.08
Member of same customs union	50	-0.81* (0.37)	0.45	-0.71** (0.06)	1880.93

Note: The outcome variable takes the value 1 if a dyad experienced a conflictual outcome in a given year. Standard errors are given in parentheses. The likelihood of the parameter expresses the odds of a conflictual outcome following a change of integration type.
* p<.05.
** p<.01.

The logit regression reported above confirm - generally speaking - the first hypothesis. Limited integration thus lowers the likelihood of a conflictual outcome. On the other hand, the effects of limited security integration and limited economic integration are inverse. This is in line with our fourth proposition although we did not expect that security cooperation is linked to an increased probability of conflictual outcomes. Not even dyads which belong to the same alliance have a significantly reduced

level of conflict. It should be noted that this surprising finding is largely due to the recurrent conflicts between the two NATO members Turkey and Greece. Economically integrated dyads where both states belong to a customs union are equally not more likely to settle for negotiations or the status quo in a given year than dyads where only one state was a member of this type of organization. In contrast to the second hypothesis, the distinction between integrated and nonintegrated dyads does thus not matter much.

To test the disintegration proposition (hypothesis 3), we conducted the same kind of analysis. Table 3 provides these results. Since economic disintegration decisions are a rare event, we only distinguished whether a dyad member left a customs union.

Table 3: *Likelihood of a conflictual outcome as a function of disintegration dyad type (bivariate logit regressions, N=1496)*

Predictor variables	**n**	**Parameter**	**Likelihood**	**Constant**	**Loglikelihood**
Both states left alliance	167	1.24** (0.17)	3.44	-0.89** (0.06)	1831.58
One state left alliance	509	0.67** (0.11)	1.96	-0.98** (0.07)	1952.20
One state left costums union	19	0.74** (0.64)	2.10	-1.46* (0.64)	1884.87

Note: The outcome variable takes the value 1 if a dyad experienced a conflictual outcome in a given year. Standard errors are given in parentheses. The likelihood of the parameter expresses the odds of a conflictual outcome following a change of integration type.

* p<.05.

** p<.01.

Table 3 suggests that political disintegration in the form of exits from core IGOs enhances the likelihood of a conflictual outcome. To leave an international organization is thus at least in the domain of security policy a sign that a states does not care about international commitments anymore. It has to be acknowledged that the impact of disintegration might be due to latent factors. Governments which consider to employ force are thus likely to change alliances. In other words, security disintegration might be an almost necessary sideeffect of growing tensions. Exits from customs union have been so rare in Europe that no reliable test could be undertaken.

The relative impact of political integration: In order to control the robustness of our findings, multivariate logit regressions were undertaken. Table 4 reports the relative importance of limited integration, democracy and major power status in three equations. In the first equation, we only assess the influence of alliance membership by the initiator or the target. These two variables take the value of 1 if nation A or nation B respectively belonged to a formal alliance. Defining the economic integration variables in the same way, the second equation accounts for participation in customs unions. The third equation, finally, summarizes the impact of the two pairs of predictor variables.

Table 4: *Logit analysis of the impact of limited economic and security integration on the likelihood of a conflictual outcome*

Predictor variables	***Security integration***	***Economic integration***	***Both types of integration***
Alliance member$_A$	0.32*	-	0.45**
	(0.14)		(0.14)
Alliance member$_B$	-0.26	-	-0.21
	(0.14)		(0.14)
Customs union member$_A$	-	-0.95**	-1.11**
		(0.26)	(0.26)
Customs union member$_B$	-	-0.83**	-0.70**
		(0.26)	(0.27)
Democracy$_A$	-0.46**	-0.52**	-0.46**
	(0.13)	(0.13)	(0.13)
DemocracyB	-0.39**	-0.33**	-0.40**
	(0.13)	(0.13)	(0.13)
Major power$_A$	1.77**	1.81**	1.67**
	(0.13)	(0.13)	(0.13)
Major power$_B$	0.54**	0.38**	0.48**
	(0.15)	(0.14)	(0.15)
Constant	-1.38**	-1.15**	-1.28**
	(0.15)	(0.11)	(0.14)
Log-likelihood	1614.50	1590.58	1580.36
N	1496	1496	1496

Note: The outcome variable takes the value 1 if a dyad experienced a conflictual outcome in a given year. Standard errors are given in parentheses.
* p<.05.
** p<.01.

The first important finding is that the effects of limited economic integration are still negative and significant. Members of customs union are thus more likely to settle for negotiations or the status quo in the interactions with another state after the effects of power status and domestic decision-making have been partialled out. The impact of security integration (memberships in alliances) continues to be more ambiguous. At least for initiator nations, participation lowers the likelihood of peaceful dyadic interactions. This reflects on the one hand that alliance memberships become more attractive in the presence of tensions. If governments know that most of their potential enemies are likely to be doves, there is no need to join an alliance. The association between security integration of target nations and the likelihood of a conflictual outcome is negative, but not significant. This seems to indicate that alliance memberships have partly a deterring effect.

The table furthermore shows that both domestic and international constraints affect the likelihood that states accept a peaceful outcome in the relationship with other states. Since integration defined by the membership in certain types of international institutions does not require democratic decision-making, the two liberal hypotheses supplement each other. Constraints in the form of democratic institutions, however, seem to have a stronger impact than the effects due to international institutions. The results furthermore suggest that power status is the most important variable. Major powers thus tend to break

the status quo in dyadic interactions more frequently than other states.

The same kind of analysis is undertaken to assess the role of disintegration. The predictor variables "Alliance exit" and "Customs union exit" are coded as 1 if a state left an organization of this type during the last five years. We furthermore distinguish between the disintegration decisions by nation A and nation B.

Table 5: *Logit Analysis of the impact of limited economic and security disintegration on the likelihood of a conflictual outcome*

Predictor variables	***Security disintegration***	***Economic disintegration***	***Both types of disintegration***
Alliance exit$_A$	0.63**	-	0.64**
	(0.14)		(0.14)
Alliance exit$_B$	0.56**	-	0.55**
	(0.15)		(0.15)
Customs union exit$_A$	-	0.77	0.90*
		(0.63)	(0.64)
Customs union exit$_B$	-	0.94	0.86
		(0.68)	(0.70)
Democracy$_A$	-0.45**	-0.48**	-0.42**
	(0.13)	(0.13)	(0.13)
DemocracyB	-0.24	-0.30*	-0.22
	(0.13)	(0.13)	(0.13)
Major power$_A$	1.68**	1.88**	1.69**
	(0.14)	(0.13)	(0.14)
Major power$_B$	0.25	0.39**	0.23*
	(0.13)	(0.11)	(0.15)
Constant	-1.63**	-1.38**	-1.68**
	(0.12)	(0.11)	(0.12)
Log-likelihood	1578.79	1614.00	1570.72
N	1496	1496	1496

Note: The outcome variable takes the value 1 if a dyad experienced a conflictual outcome in a given year. Standard errors are given in parentheses.
* $p<.05$, ** $p<.01$.

From the three equations reported in table 5 it is fairly clear that the third hypothesis receives support from our data. States are thus more likely to engage in a conflict after exits from both security alliances and customs unions. The results pertaining to economic disintegration are non-significant, reflecting the very small number of instances where a state left a customs union. Security disintegration seems to be unambigously a signal that a state does no more have to take into account the constraints imposed by an IGO. The results remain significant when the time frame for exits from alliances is limited to one year or extentend to ten years. This reflects that fluidity in alliance behavior might be a powerful early warning indicator to predict international conflict.

To sum up, the different tests established in accordance with the first hypothesis that political integration in the form of customs union memberships constitutes an important pacifying force. However, in contrast to the second proposition, we could not show that there is a difference between

integrated and nonintegrated dyads. This result is in opposition to the puzzling finding that dyads with only one democratic states are more likely to engage in conflict than dyads consisting of two democracies. As expected from the third hypothesis, disintegration events, and particularly exits from security alliances, enhance the likelihood of a conflictual outcome in a dyad. The study also showed in the analysis of a fourth hypothesis that there are major differences between security and economic integration. Alliance memberships are linked to increased likelihoods of conflict whereas participation in regional economic IGOs pacifies interstate interactions.

V. CONCLUSION

We have offered a statistical analysis of the "peace through integration"-hypothesis. Our findings seem to confirm the liberal postulate that formal interstate cooperation promotes peace. This paper also found evidence supporting the opposite claim: Disintegration in the forms of exits from IGOs increases the propensity to employ force.

What do these results imply for the study of regional integration? They challenge some orthodoxies, such as the neorealist claim that international institutions are weak responses to the anarchy of the interstate system (Grieco 1990:230). Our analysis suggest that the network of IGOs is an important component of the interstate system. Although factors such as the number of IGOs do not lower the likelihood of conflict, participation in some key organizations is a major pacifying force. Our research thus endorses the optimism that international institutions are more than vehicles to reduce transactions costs (Axelrod and Keohane 1986). Most interestingly, non-security organizations are better safeguards than military alliances. Taking into account the divergence between memberships in economic and security organizations, researchers should be cautious and employ the term "integration" in a discriminatory way.

Our analysis represents only a first step toward a systematic rediscovery of the integration hypothesis. Future empirical work should test whether our findings are robust across different datasets and definitions of integration and disintegration. Other studies might also compare the importance of political intergration with effects of societal forms of integration. Increased interactions between different societies could create "norms" which pacify interstate interactions. Our current framework does equally not speak to the possibility of institutional learning. Extensions could also include a comparison of the integration hypothesis with realist and system-level explanations.

However, these limitations do not completely cast doubt on our overall conclusion that political integration in the form of participation in customs unions exerts a pacifying effect. Based on an institutionalist perspective, we add a further liberal explanation to the understanding of war and peace.

This article also clarifies why IGOs consisting of liberal democracies should open their doors to non- or semi-democracies. Policy makers face this question with regard to the aspirations of countries like Turkey which wish to become members of the European Community. We show that there might be substantial non-economic reasons why the participation of such states is crucial.

EXPLAINING THE VARIATION IN STATE MEDICAID PRENATAL CARE SERVICES: THE ROLE OF FEDERAL ADMINISTRATIVE REGIONAL OFFICES

Saundra K. Schneider

University of South Carolina
Summer 1993

Prepared for delivery at the 1993 Annual Meetings of the
American Political Science Association. Washington, DC.
September 2-5, 1993.

The study of public policy in the American federal system is both a fascinating and frustrating enterprise. On the one hand, the national government has a significant impact on the adoption and evolution of public programs across the country. On the other hand, however, state and local governments have a tremendous influence on public policy activity within their own jurisdictions. This makes it extremely difficult to disentangle the role of various levels of government on public policy development in the United States.

This situation is compounded by the fact that other governmental actors are also involved in the process. The national government has established federal regional offices across the country. These regional offices interpret the policies and guidelines of the national government for state and local authorities. And, they channel subnational requests and demands back to national government officials. In sum, they occupy an important intermediary position within the American federal system (Crotty 1988). As a result, they can have a profound impact on the evolution of public policies. Unfortunately, however, there has been virtually no research into the activities of these regional offices. Therefore, very little is known about the ways in which this governmental factor impinges upon the policy process.

This paper examines the role of federal regional offices in an important public policy area. More specifically, I will develop and test an empirical model of maternal and child health care choices in state Medicaid programs. The model focuses directly on the influence of regional administrative offices in shaping state-level policy responses. The empirical results demonstrate that regional administrative factors do affect the adoption of maternal and child health care services in the Medicaid program. In contrast, more traditional economic and political variables seem to have little direct impact on state-level decisions in this policy area.

The paper is organized as follows. First, I will briefly discuss the significance of maternal and child health care issues in the United States. Then, I will describe how the Medicaid program is used to address many of the major concerns in this policy area. After that, I will specify a model of state Medicaid maternal and child health care decisions which incorporates the role of federal regional offices.

In the remaining sections of the paper, I will present and discuss the empirical findings. Overall, the results of this analysis yield useful insights into the influences on Medicaid maternal and child health care service choices. And, they have more general significance: They help explicate the important intermediary role of federal regional agencies in the public policy process.

Maternal and Child Health Care as a Public Policy Issue

Maternal and child health care is an important public policy issue in the United States. First, and foremost, it is a barometer of the overall well-being and conscience of the nation (Hughes, et al. 1988). Women and children are two of the most vulnerable groups in American society. Consequently, they should receive appropriate and effective medical treatment. The extent to which women and children are actually shielded from preventable and unnecessary medical problems, tells us a great deal about the value priorities and moral commitment of the country.

Second, the issue is noteworthy for purely pragmatic reasons. Stated simply, maternal and child health care is cost-effective. It has an immediate impact on the health care status of pregnant women and infants (U.S. General Accounting Office 1987; Hughes, et al. 1989). It also has long-range societal consequences. Healthy mothers are more likely to deliver healthy babies. Healthy babies have a better chance of becoming healthy children. And, healthy children do better in school, and they are more apt to grow up to become productive American citizens (McManus 1986). By improving the health care status of mothers and children, we are able to deal with a host of important social issues.

Maternal and child health care is also a very symbolic and politically-expedient issue. Most Americans believe that "mothers," "babies," and "children" deserve special care and treatment. So, it is relatively easy to focus public attention on this problem area. It is also much easier for public officials to push for government-sponsored maternal and children health care programs. No one wants to be against providing services to pregnant women and infants (Schneider 1992). This, in turn, helps to stimulate and legitimize policy activity.

Governmental Responses to Maternal and Child Health Care Problems

As is the case with all major social problems, American policy-making with respect to maternal and child health care is a highly complicated enterprise. There are a myriad of public programs designed to address certain aspects of the problem, including the Title V Maternal and Child Health Block Grant Program, the Special Supplemental Food Program for Women, Infants, and Children (WIC), the Community Health Centers Program, etc. Of these, the Medicaid program clearly represents the most significant and inclusive governmental effort (McManus 1986; Hill 1990). By almost any measure (e.g., expenditures, number of services provided, number of women and/or infants covered), Medicaid far exceeds the other programs. Over the years, the Medicaid program has been used aggressively in order to address the causes and symptoms of maternal and child health care problems. For example, it has helped to reduce the incidence of teen pregnancy and out-of-wedlock births, rates of maternal and infant mortality, and the spread of many childhood diseases. Because of the program's broad responsibilities, we will focus on Medicaid for the remainder of this study.

In order to explicate Medicaid's maternal and child health care responsibilities, it is necessary to understand something about the structure of the program itself. Medicaid was created in 1965 as a joint federal-state initiative in which both levels of government were to work together in order to provide medical assistance to the poor (Stevens and Stevens 1974). The federal government was a major source of funding and coordination across separate states. It established general programs that were designed to stimulate, rather than control, state activity. Within this overarching framework, individual states were supposed to create unified health care systems for their low-income citizens. In so doing, they retained a great deal of power and responsibility over such important matters as specific eligibility criteria, service provision, and provider participation (Bovbjerg and Holahan 1982).

Medicaid's provisions for maternal and child health care closely reflect the overall structure of the program. Of course, the program varies from one state to the next, but it is possible to make some generalizations about Medicaid coverage during the early years. Eligibility criteria tended to be relatively

strict, clearly defined, and fairly uniform across the states. The most important provision was that a woman had to qualify for cash assistance under the AFDC program before she could obtain any Medicaid benefits (Rosenbaum 1985). This meant that there must already be children in the household with no other family member (e.g., husband, parent, etc.) present to support the woman. Thus, program beneficiaries had to meet both categorical and financial criteria.

The early Medicaid eligibility requirements were fairly stringent. But, once women and children qualified for the program, they could obtain a wide variety of health care services. Everyone received a basic package of benefits, which included physician care, hospitalization coverage, lab and x-ray benefits, and outpatient hospital services. Women received maternity benefits for subsequent pregnancies and deliveries. Children were eligible for targeted services such as immunizations and preventative care (Johnson 1985). In summary, Medicaid's initial efforts at maternal and child health care were aimed at a limited population and focused on curative measures; they dealt with the most urgent problems after they arose.

The basic system remained fairly stable throughout the 1970s. But, major changes occurred in response to the Reagan Administration's New Federalism plan (Schneider 1988). The Omnibus Budget Reconciliation Act of 1981 (OBRA-81) gave the states more leeway to pursue more cost-effective payment policies for hospital-related maternity and infant care. For example, it allowed states to experiment with all-payer, multiple-rate, and diagnostic-related-group prospective payment systems, and it encouraged the development of "alternative delivery systems" (e.g., health maintenance organizations and case management systems) for the provision of both primary and institutional prenatal care. In addition, OBRA-81 also gave states an option to target subgroups of the Medicaid population with special health care needs. States choosing this option could essentially define the full range of medical benefits that would be available to the targeted group of recipients. This provision was specifically intended to help pregnant women and infants (Schneider 1992).

Overall, the OBRA-81 shifted the locus of Medicaid decision-making from the national government to the states. In turn, this gave the states more control over the management, coverage, and delivery of the program's maternal and child health care services. A number of states took advantage of the newly-available options. They extended Medicaid coverage to low-income women and their children who met the categorical but not the financial criteria for regular Medicaid eligibility (Hill 1986). Several states also experimented with "alternative" health care delivery systems to provide more timely and continuous care to pregnant women and children (Hill 1986, 1987).

Further changes in Medicaid's coverage of maternal and child health care resulted from the passage of the Consolidated Omnibus Budget Reconciliation Act (COBRA) of 1985. Although it was a piece of national legislation, COBRA created a new opportunity for the states by waiving the federal comparability rule. The latter required each state to finance uniform services for all Medicaid recipients regardless of their categorical or financial status. In contrast COBRA enabled states to add extra benefits and/or finance greater amounts of care for pregnant women and infants. A number of options were possible. States could expand the traditional types of benefits-- such as physician services, home health care, etc.-- for these two population groups. They could also provide special services to pregnant women and children-- that they did not provide to other groups within the Medicaid population. And, they could even add entirely new types of "enhanced" prenatal care services or child health care benefits. For example, they could identify pregnant women "at risk" and then channel them into more "managed" and intensive forms of care (Rosenbaum 1985). In this manner, Medicaid moved away from strictly curative services into more preventative, non-medical strategies.

Several months after the enactment of COBRA, Congress made yet another major change in Medicaid. The Omnibus Budget Reconciliation Act of 1986 (OBRA-86) officially severed the linkage between AFDC and Medicaid eligibility for certain deserving subgroups of the population (Hill 1987). Pregnant women and children were specifically identified as such deserving subgroups because of their special needs. OBRA-86 essentially opened the door for states to expand their Medicaid programs to

thousands of low-income women and children without having to simultaneously enlarge their AFDC coverage. The severing of these two programs represented a significant change in the nation's way of handling maternal and child health care issues (Hill 1990).

Medicaid was revised several more times during the late 1980s and early 1990s. But, these changes tended to be just expansions upon or modifications to earlier efforts. For example, the Omnibus Budget Reconciliation Act of 1987 gave states the authority to extend Medicaid eligibility to pregnant women and infants up to 185 percent of the federal poverty rate. The Medicaid Catastrophic Coverage Act (MCAA) mandated that all states expand Medicaid coverage for pregnant women and infants with incomes at or below 75% of poverty by July 1, 1989, and then up to 100% of poverty by July 1, 1990. The Omnibus Budget Reconciliation Act of 1989 superseded the MCCA by altering the scope and timing of earlier Medicaid eligibility changes: States were to extend program coverage to pregnant women and infants at 133 percent of the poverty rate; children were to be covered until the age of 6; and, the timetable for implementing all of these changes was moved up to April 1990. Then, legislation passed in 1990 required states to phase in Medicaid coverage of children up to age nineteen living in families below the federal poverty level by October 2001.

Clearly, Medicaid's provisions for maternal and child health care in the 1990s are substantially different from those that were originally established back in 1965. Overall, the changes made in Medicaid during this time period illustrate two important points. First, the federal and state governments both have been actively involved in reshaping governmental assistance for low-income women and children. The national government has been responsible for initiating major changes in the Medicaid program, allowing thousands of additional low-income women and children to receive more timely and appropriate forms of care. But, the states have not simply been passive, reactive participants in this process. They have played a key role in the implementation of maternal and child health care policy changes, and they serve as the major testing grounds for new policy efforts.

Second, there is now wide variability across the states' maternal and child health care systems. The differences in state-provided Medicaid services are both quantitative and qualitative in nature. For example, Florida provides a sparse package of very few maternal and child health care benefits to its Medicaid population. In contrast, Washington finances a broad, fairly comprehensive package of services. North Carolina concentrates on providing the "enhanced" services derived from OBRA-85. California's efforts are aimed in a different direction; that state focuses on expanding program eligibility from the provisions of OBRA-86. Overall, it is accurate to say that each state has its own unique Medicaid-based system of maternal and child health care.

Possible Explanations for Interstate Variability

The information presented in the previous section raises an obvious and extremely important question. Why is there such wide variability across the states' Medicaid maternal and child health care systems? There has been an enormous amount of research devoted to this problem (U.S. General Accounting Office 1987; Office of Technology Assessment 1987). But, virtually all of this work has involved case studies or in-depth comparisons of small numbers of states (Erdman and Wolfe 1987). This line of work have not been aimed at developing broad, general theories of policy development. Instead, it has argued for the dominance of the unique circumstances surrounding each state's maternal and child health care system (Hughes, Johnson, and Rosenbaum 1988, 1989; Breyel 1990; Breyel and Hill 1993).

In this study, I intend to take a quite different direction and look at general factors that influence states throughout the nation. For guidance in this endeavor, we must look at the more general literature on social policy developments within the American states. This area has received a great deal of scholarly attention. Most of the previous studies can be placed under one of two broad headings: Those that emphasize state-level factors and those that focus on national initiatives.

At the state level, researchers have focused on three major sets of factors that influence policy outputs: state economic conditions, state political institutions, and the ideology of the state's population. A long line of research was aimed at comparing the relative magnitude of political versus economic

variables. Almost uniformly, economic forces were found to outweigh the effects of political actors and organizations (Dye 1966). But, a more recent series of analyses suggests that the previous conclusion was premature. Instead, the prevailing ideology of the state's population shapes all subsequent aspects of the system including political and policy outcomes (Kligman and Lammers 1984; Wright, Erikson, and McIver 1987). And, there is still another line of state-focused work, that focuses on a broad combination of factors loosely grouped under the heading of "political economy" (Plotnick and Winters 1985; Barilleaux and Miller 1988; Peterson and Rom 1990). This approach suggests that policy outputs result from the interplay between relevant producers and consumers. In the case of maternal and child health policy these two groups would be represented by state agencies, and pregnant women and child, respectively. Thus, there are several perspectives that basically come to the same general conclusion: State by state variability in social policy-making is due to differences among the states themselves.

The second major perspective emphasizes the primacy of the national government. This view can be traced back to conceptions of nation-centered federalism (see Wright 1982; Anton 1989). The national government is the policy innovator, and the states merely follow its lead. Federal officials generally answer to large constituencies; hence they are forced to take broader and often more progressive stances with respective to major social issues. Furthermore, the national government has the power and the resources to impose its will on the states-- a course of action that it has often pursued at least up until the 1980s. Along with this traditional view, a more recent and somewhat different approach still arrives at a similar conclusion: Several researchers have suggested that the national/state mix in policy-making activities is most accurately described as a series of "principal-agent" relationships (Gramlich 1982; Chubb 1985). The national government is the dominant actor, and the states are responsive to its initiatives. It is in this sense, that they serve as "principals" and "agents" respectively. Thus, there are several lines of thinking in which the national government exercises a dominant role, permeating each state's own policy-making system.

Both the state- and nation-centered perspectives provide valuable insights into social policy-making in America. However, they probably only have limited relevance for understanding maternal and child health care initiatives in the states. There are several reasons for this. For one thing, the special status of mothers and infants makes them somewhat immune from political manipulation and derogatory accusations of welfare fraud. They tend to receive services regardless of prevailing ideological climates or economic fluctuations. In addition, maternal and child health services are often initiated by bureaucrats who are by definition insulated from direct political pressures. Administrators are often highly trained experts themselves; they are often in close contact with lobbyists and members of the health care profession; and they receive at least part of their funding from the national government outside of the immediate state environment. All of this means, that their activities will be less confined by state-specific factors. Finally, the nation-centered perspective seems to be contradicted by the very existence of vast differences across the states. If the federal government really did dominant the process, then we should observe the relative uniformity across the states that existed during the 1960s rather than the wide interstate heterogeneity that seems to be the hallmark of the 1990s. For all of these reasons, the traditional explanatory factors for state-level policy developments do not seem to apply to maternal and child health care.

As an alternative, I argue that it is important to focus on activities within the executive branch of government. This is certainly true within the states. As already mentioned, it is state-level bureaucrats who initiate many of these services in the first place. Because of their ongoing contact with relevant parties (i.e., interest groups, providers, and recipients) and their access to important information (e.g., state health care statistics), state administrators find themselves in a uniquely effective position for setting maternal and child health care policy. The dominance of the executive branch extends to elected officials as well. During the 1980s, it was state governors rather than state legislators who acted as policy innovators in this area (Nathan and Doolittle 1987; Beyle 1989; Schneider 1989).

But, looking within the states is not enough. We also need to look outside state boundaries at an intermediary level of decision makers which has been almost completely overlooked in past research. The federal government relies upon ten regional offices to administer the Medicaid program throughout the nation. The staffs in these offices are agents of the federal government, but it would be inaccurate to characterize them as national-level policy-makers. They do not initiate programs or services. Instead, they are the interpreters of federal guidelines and regulations. At the same time, they clearly exist "above" the states that fall within their respective jurisdictions. Before the states can initiate any program changes, they must submit their requests and accompanying documentation through these offices for federal approval. This, in turn, gives these regional offices an enormous amount of formal and informal influence over precisely what the states can do. For this reason, they clearly deserve more attention by researchers examining policy-making in the American states.

Model and Estimation

In this section I will examine an empirical model of state maternal and child health care policy-making. Contrary to what appears to be common practice, I will not begin with an all-inclusive equation and proceed by pairing away variables with nonsignificant effects. Instead, the analysis will emphasize the final model which is quite parsimonious in specification. Following a discussion of the major results, I will briefly consider the reasons for excluding other factors.

This analysis will be based upon state-level-data for 1990. Perhaps surprisingly this is the only year for which information on all the relevant variables is readily available. And, if we must be limited to a single time point, then 1990 is a good choice since it falls after all of the major policy innovations of the 1980s.

The dependent variable for this analysis summarizes the package of enhanced prenatal care services offered in each state Medicaid program. The focus on this particular type of care is very reasonable because prenatal activities are crucial to the health of both the mothers and the children (Institute of Medicine 1988, 1989). Under the Medicaid program, states can offer up to seven distinct

enhanced prenatal services: risk assessment, nutritional counseling, health education, psychosocial counseling, home visitations, transportation, and case management. It is up to the states to decide what combinations, if any, of these services they will provide. I will simply use the number of services adopted by each state. This is in effect a summated rating scale measuring state commitment to maternal and child health care. The reliability for this scale is .884. Measures of this type are based upon tangible evidence of policy decisions by state-level actors. As such, they are effective summaries for the outcomes of complex policy-making processes (Jacoby and Schneider 1992; Schneider and Jacoby 1992). The data for this variable are obtained from the National Governor's Association, *MCH Update, State Coverage of Pregnant Women and Children.*

A histogram summarizing the frequency distribution for this information is presented in Figure 1. The distribution is clearly bimodal with about a third of the states providing virtually no enhanced prenatal services and about the same number taking advantage of all available options. In this sense, the states exhibit a rather extreme degree of variability with respect to their policy choices in this area. Of course, accounting for these differences is precisely the focus of this analysis.

The model includes four independent variables, all of which can be defined in a straightforward manner. First, there is the party of the incumbent governor in 1990. This is coded as a dichotomy with zero representing Republican governors and one for Democrats. In 1990, there were 23 Republican governors and 27 Democratic governors. The data for this variable are obtained from the *Statistical Abstract of the United States, 1992.*

The second independent variable is intended to summarize each state's overall commitment to the Medicaid program's general population. This is operationalized as the number of optional Medicaid services offered within each state. The federal government requires all states to provide a common package of basic, required services. Beyond this, states can adopt up to 31 (in 1990) more optional services. The number of optional service adoptions provides an empirical measure of each state's commitment to providing health care for its poor citizens (Jacoby and Schneider 1992, Erdmand and

Wolfe 1987). The information needed to create this variable is obtained from the Health Care Financing Administration, within the U.S. Department of Health and Human Services.

The third independent variable is the number of low birthweight infants per 1,000 live births within each state. This is widely viewed as a valid indicator of the severity of maternal and child health conditions (Institute of Medicine 1985). In the present context we can interpret it as a measure of the need for Medicaid prenatal care services. These figures are taken from the National Center for Health Statistics, Centers for Disease Control and Prevention.

The last independent variable is the set of federal regional offices. It is important to emphasize that these regions are determined by federal regulations. They often do not correspond to "standard" geographic regions. Table 1 shows the division of the states across the ten offices. For the empirical analysis, these regions are operationalized as nine dummy variables; region eight is left as the reference category. These regional designations came directly from the Bureau of Medicaid Statistics, an office of the Health Care Financing Administration.

The results of the empirical analysis are summarized in Table 2. The table entries give the OLS coefficient estimates obtained when the prenatal services variable is regressed upon the previously defined independent variables. The equation shows a reasonable level of explanatory power. The R^2 is .54. Note, however, that the use of the nine dummy variables markedly decreases the degrees of freedom for the equation. Therefore, it is important to examine the adjusted R^2. Fortunately, this value remains quite robust at .39. Clearly, there is no problem here of "overfitting" the model.

The model represented in Table 1 results from a rather lengthy process of testing many alternative specification. Hence, it is not surprising that all of the included independent variables show important effects on Medicaid prenatal care adoptions. The left most column of the table gives the nonstandardized coefficient estimates with standard estimates in parentheses.

First, the party of the governor does make a difference. Democratic governors provide an average of 2.5 fewer services than their Republican counterparts. At first this result is very surprising. It seems

to contradict the conventional wisdom about differences between Democrats and Republicans. Nevertheless there are two factors that probably account for this result. On the one hand, prenatal care is widely perceived to be a cost-effective measure. Republican policy-makers have taken the lead in pursuing any means of reducing public expenditures while still covering needy populations. For this reason, prenatal care measures are particularly attractive to Republican gubernatorial administrations. On the other hand, Democratic governors have focused their attention elsewhere. They have been much more active in expanding Medicaid eligibility to additional segments of the population (Schneider 1989). There overall orientation holds that it is more important to bring people into the program than it is to provide specialized benefits to particular needy groups. Thus, the significant, but counterintuitive difference between Democrat and Republican governors is very reasonable once one takes the complexities of maternal and child health care policy into account.

The results for the second independent variable, the incidence of low weight births, are exactly as one would expect on both theoretical and intuitive grounds. The regression coefficient for this variable is .98, and it is statistically significant. Stated simply, as the rate of low weight births increases so does the number of prenatal services. This finding is very encouraging. It suggests that policy-makers are responsive to the health care problems that exist within their respective states.

The number of optional services also has a significant, positive effect on the provision of prenatal care. The immediate interpretation of this result is straightforward. States that are relatively generous with respect to overall health care services, also tend to provide the greatest amounts of prenatal care. But, I also believe that this is indicative of a more interesting phenomenon. These optional services are initiated by state Medicaid administrators. And, they represent their own perceptions of state health care problems and conditions. If this variable truly reflects the bureaucrats' orientations, then the results obtained here are a clear manifestation of bureaucratic influence on state policy-making. Political scientists have long argued that the bureaucracy is now a powerful interest group in its own right (Meier 1993). What we are seeing here may well be an example of precisely this phenomenon.

Finally, there are sizable differences in prenatal care across the HCFA regions. The coefficient for each region represents the mean difference in the number of prenatal care services between the states in that region and those in the omitted reference region (Region VIII). In order to facilitate interpretation, Figure 2 shows a bar chart for regional influences. The height of each bar is proportional to the respective dummy variable coefficients. There seem to be three groups of regions. First, Regions I, IV, V, and VIII (the omitted reference region) all offer relatively few prenatal care services; their coefficients are all smaller than 1.00. This represents a heterogenous group of states. Most of them are from the midwest or the south. But beyond this, they have no obvious common characteristics. Instead, I believe this grouping merely represents a point originally made back in the discussion of Figure 1. The modal tendency in the United States is for states to provide no enhanced prenatal care services, regardless of their other health care benefits.

The second grouping consists of Regions VI, VII, and IX. The states in this grouping all provide moderate levels of prenatal care; their coefficients are 1.08, 1.82, and 1.42 respectively. These states tend to fall in two geographic regions: the far West (California, Hawaii) and the "mid-South" (from Iowa southward). These states have all taken highly visible steps toward the provision of maternal and child health care services. Some of these states, like California, made early progress, but have not really sustained it overtime. Other states have made later, but nevertheless, serious commitments to this policy area. These would include states like Arkansas and Missouri (Hill 1987; Hill and Breyel 1989).

The third set of regions consists of the true policy leaders in this field. Regions II, III, and X contain states like New York, New Jersey, and Oregon. These are states that are quick to take every option available in all facets of health care policy. For example, New Jersey was the first state to introduce a waiver program for acquired immunodeficiency syndrome patients. And, Oregon is well-known for its controversial health care "rationing" program. Therefore, it is not surprising that they have taken action in the maternal and child health care area as well.

These results show that service provisions vary with the regional offices, but they do not directly demonstrate that the interstate differences are due to these HCFA-designated regions. Nevertheless, I strongly believe that to be the case. The policy orientations of the staffs at this regional level have an enormous impact on Medicaid program operations. They clearly serve as gatekeepers in that any state-level innovations must be approved by the relevant regional office before it can be put into place. The regional offices also disseminate policy guidelines, and in this sense promote the adoption of new services within their jurisdictions. Thus, the regional offices can both stimulate and encourage developments in Medicaid-related maternal and child health care policy.

We have identified several influences on maternal and child health care policy outputs. But, which ones have the greatest impacts? We can address this question by examining the standardized regression coefficients which are presented in the right-hand column of Table 1. The party of the governor, low birthweight, and number of optional services all have strong influences, with the first two somewhat larger than the third. But, the most interesting finding is the magnitude of the regional influences. Two of these coefficients have the strongest impacts of any of the variables in the model. This confirms the importance of the regional offices. The magnitudes of their effects attest to their importance in the policy process.

Before leaving this analysis, it is useful to consider briefly the model specification. It is probably immediately obvious to the reader that the regression equation does not include many of the variables that are traditionally employed in state policy analysis. Their omission was not based upon a priori assumptions. Instead, I tested many preliminary models, which incorporated such factors as legislative partisanship, state economic wealth, federal matching rates, and state-level administrative features. None of these variables showed effects that were significant in either statistical or substantive terms. It is also important to point out that the HCFA regions are not merely surrogates for state political cultures. Indeed, they are virtually uncorrelated with the measures of state ideology and partisanship developed by Wright, Erikson, and McIver (1985). For all of these reasons, I believe that the model employed here

provides an accurate and stable representation of the major influences on Medicaid maternal and child health care benefits.

Conclusions

Perhaps, the most prominent finding from this study is the fact that prenatal care services are not a function of the kinds of factors that influence other aspects of state-level policy development. Many studies have shown that other types of policy outputs, such as expenditures in particular areas, hybrid measures of program coverage and effort, etc., are dependent upon a straightforward array of independent variables (Hanson 1984; Schneider 1988). These include such factors as state-level economic conditions and political orientations. But, these variables simply do not work in the present context. I believe this is directly due to the nature of the decision-makers who are involved in this policy area. Enhanced prenatal services are determined by bureaucrats who can largely afford to ignore the environmental forces that affect the actions of other governmental officials. Of course their insulation from the political world is not absolute as evidenced by the influence of gubernatorial partisanship. But, even the latter variable produced a surprising and counterintuitive result. Overall, this study suggests that administrators' own inclinations are a major determinant of maternal and child health care service provision.

It is also important to note that even though the present results are quite different from those in earlier studies they are still largely consistent with general theories of state policy-making. Specifically, the array of independent variables suggests an interpretation based upon political economy. This perspective holds that the supply of goods-- policy outputs-- is determined from the interplay between producers and consumers. In this case, the goods are prenatal care services themselves. The producers are state Medicaid administrators. The consumers are low-income pregnant women and infants. The propensity to produce is measured by bureaucratic generosity, while the demand for services is gauged by the size of the needy population. As either one of these factors becomes more pronounced, the supply of goods (i.e., the number of services) tends to expand. Thus, the specific actors may be different, but

the general process fits very nicely with a prominent theoretical perspective about the origins of state-level policies.

Another prominent result from this analysis centers on the influence of federal regional offices. This is important because it represents a distinct level of policy decision-making, and one that exists along with the more commonly recognized national- and state-level institutions. On the one hand, I have successfully incorporated into a rigorous empirical model a factor that any Medicaid bureaucrat clearly recognizes to be vitally important. On the other hand, it is very difficult to operationalize the exact processes by which regional offices influence policies. Stated simply, we know very little about the individuals who staff these offices or the precise ways that they function. Indeed, it is likely that their procedures vary from one office to the next. Nevertheless, the empirical results clearly show that regional influences do in fact exist. The dummy variable coefficients from the regression analysis capture the net impacts of these offices, but not the exact processes that generate these impacts. Thus, these results represent a satisfying addition to theories of policy-making. But, they also provide a challenge for future work which must try to explicate these influences more fully.

Table 2. Influences on State Medicaid Enhanced Prenatal Care Services.

Independent Variables	Unstandardized Coefficient	Standardized Coefficient
Region I	0.90 (1.23)	0.12
Region II	4.14* (1.86)	0.32
Region III	4.17* (1.31)	0.49
Region IV	0.51 (1.36)	0.08
Region V	.004 (1.38)	0.001
Region VI	1.08 (1.36)	0.13
Region VII	1.82 (1.31)	0.20
Region IX	1.42 (1.52)	0.13
Region X	5.63* (1.39)	0.60
Party of the Governor	-2.50* (0.70)	-0.49
Optional Medicaid Services	0.19* (.09)	0.35
Low Birthweight Infants	0.98* (.43)	0.46
Intercept	-7.75	
Adjusted R^2		.39

Number of Observations: 49.

Table entries are ordinary least squares regression coefficients. Standard errors are in parentheses.

*Coefficient is significant at .05 level.

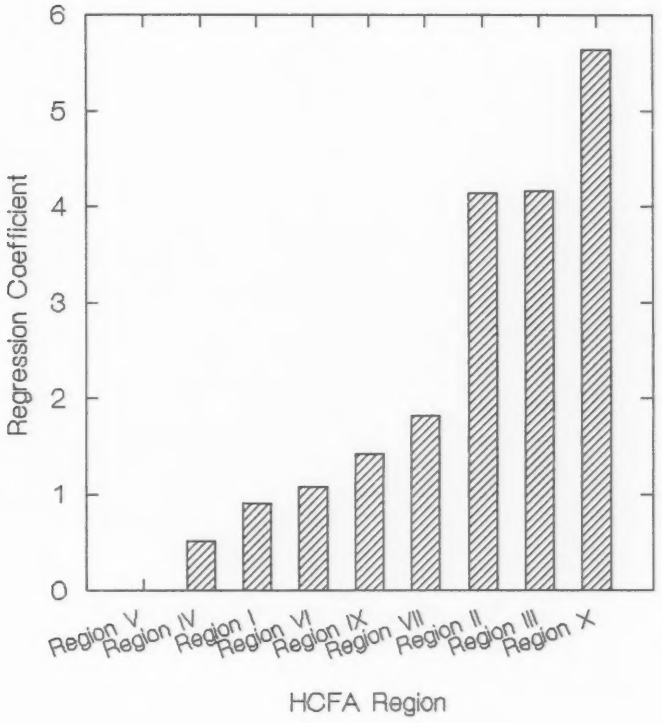
Source: National Governors Assocation *MCH Update*, 1990.

Figure 2: Bar Chart Showing Dummy Variable Regression Coefficients for the Impact of HCFA Regions on the Number of Medicaid Optional Prenatal Care Services.



Note: The bar heights correspond to the values of the regression coefficients given for each of the HCFA region dummy variables, as shown in Table 2. For each region, the coefficient value represents the difference between the mean number of services provided by states within that region, and the mean number provided by states in the omitted, reference region (HCFA Region VIII).

Voter Turnout and the Role of Groups: Participation Game Experiments*

ABSTRACT:

Voter Turnout and the Role of Groups:
Participation Game Experiments

This paper reports the results of a series of experiments in which the voter turnout decision is analyzed. Seven general hypotheses with respect to turnout are distinguished (including models of individual behavior from game theoretic equilibria and learning models) and systematically elaborated, analyzed, and tested. The results are used to explore future paths of research. A distinction is made in two parameter configurations (representing winner-takes-all elections and elections with proportional representation) and three group conditions (in which the stability and openness of group composition varies). Furthermore, the effect of group size is investigated (both unequal versus equal group size and the size itself). Using the results of a post-experiment questionnaire, the effect of individual orientation in the experiment is discussed. The results show that the experimental design is successful in replicating the strategic situation of the turnout decision. The models of individual behavior in the turnout decision appear to be missing something, however. It is argued that they lack a objective ground for asymmetry between individuals in equal circumstances.

1. Introduction

The paradox of voter turnout has intrigued economists for decades now. It started with Downs' (1957) formulation of the problem. Downs confronted the theoretical irrationality of an individual vote with the empirical observation of massive turnout in general elections. This apparant lack of rationality in human behavior is something (mainly public choice) economists could not accept. Many theoretical and empirical papers have been published on the subject, but only in the last decade, rational choice models (generally using game theory) have been developped that show that turning out to vote might be rational in an instrumental sense under specific circumstances.

Nevertheless, as will be extensively discussed below, many questions concerning individual motivation in the turnout decision remain unanswered. Empirical evidence from field data has barely been used to find support the for recent models mentioned (for a review of empirical analyses of the turnout decision, see Schram, 1991). Therefore, the relevance and predictive accuracy of these models has barely been tested.

A game theoretic formulation of the turnout problem provides a useful framework for running experiments on the individual decisionmaking process concerned, however. This is the subject of the present paper. Results will be presented from a series of experiments that have been run. Using the existing literature on voter turnout and related experiments, a number of hypotheses will be derived and tested using experimental data. In addition, the data will be used to explore some future paths of research. It will be argued that there is still a lot to be learned about the individual vote decision, especially with respect to the role of different, interacting, types of individuals. The first goal of this paper, however, is simply to establish whether the laboratorium situation created provides an adequate description of the turnout problem as faced by individuals in the real world. Once this has been established, existing theories about individual behavior in the turnout decision must apply to the experimental situation as well. The results may then be used to test them and to look for possible solutions to the paradox of voter turnout.

Many of the results presented in this paper will reject existing theories, which will prove to be inadequate to explain the behavior observed in the experiments. This is not very surprising: existing theories have difficulties in explaining observed voter turnout as well. The experiments show possible ways in which the theories may be modified, however.
